The present arrangement provides for the payment of about 25c an hour to beginners and 30c an hour to good pickers or packers for a 10-hour day. The girls who are volunteering for the work in this great movement are college girls, school teachers, stenographers, telephone girls, etc., who are not only keenly conscious of the importance to the country of the work they are undertaking but feel their health will improve and their muscles strengthen in thus taking part in "the great adventure" in which every citizen of the country is involved. Their faithful services will be required and augmented as long as we are at war. It is not the amount of money they can earn that brings these girls to the field any more than a private's pay makes a millionaire's son volunteer for the trenches. It is the fact that they are "doing their bit" for the country and its fighters that is the prime motive. Over 5,000,000 women are signed up for service in England for the duration of the war and we are making a good start to emulate the example of our great ally.

THE CAMP AT LODI

Stands on a space—all boarded in—measuring 200 feet square. Provision has been made for 75 huts, neatly built of wood, with tent tops. These are now in course of erection and will soon be completed. Each hut accommodates two girls—a cot on each side. The standard size is 8 feet by 10 feet by 6 feet high. The dining hall, under the trees, will be spacious and airy and its dimensions are 24 by 60 feet—enough to accommodate 200 if necessary.

The kitchen will be set to the south of the center of the dining hall—T shape—and is 24 by 30 feet in area, fitted with every convenience for barrack use.

The sanitary arrangements are very complete and convenient and include toilets, dressing rooms, shower baths, wash trays, etc.

There will be a regular rising-call, "setting-up" exercises and definite hours as in any other properly constituted army. Farmers wanting two, four or ten or any number of workers will call for them at the camp mornings and take them to the fields, bringing them back at night.

AMUSEMENT AND RECREATION.

We feel assured that our bright, energetic American girls of this class will organize their own musicales, swimming contests and other amusements in leisure hours under their own director, just as their brothers are doing in France. Under the conditions a friendly rivalry is engendered and competition becomes keen for excellence in work as well as in play.

The way in which our best women and girls have responded to their country's appeal for help in the harvest fields and elsewhere is an inspiration to the men folk and an added impetus to its productive capacity. These women and girls will help to curb the rapacity of certain of the foreign alien element in their demands for labor payment.

Next year these Land Army cantonments will doubtless be enlarged and extended more or less all over the State, for the end of the great conflict is not yet in sight. For this reason Lodi is likely to be visited during the grape season by committees of growers from other sections of the State.

The Cheapest Place To Buy Good Trees

Live Agents Wanted In Every County

LOSSE BLENHEIM 'COT

The Losse Blenheim is one of the most profitable and satisfactory cots the California grower can plant. It bears big crops season after season. The fruit is of large size and fine quality and always brings a good price. We can furnish you with the genuine Losse strain—clean, vigorous, thrifty trees that are sure to grow and make your orchard a success.

A "Time-Sales" Plan for Tractor Dealers

Food Will Win The War
Help Produce It!

By Prof. E. J. WICKSON
Editor Pacific Rural Press
(formerly Dean of the College of Agriculture, University of California)

Peace Only Through Victory
Win The Next War Now!

A plan for financing the purchase by farmers of tractors and other kinds of power farming machinery recently came to my attention, which it seems to me will be of great assistance in the present drive for greater production of food from our farms.

The plan referred to is that of the Western Farm Credit Company of San Francisco, and it is simply an adaptation to the farmer's requirements of the time-payment plans already widely used in selling automobiles, pianos and many other articles. The farmer using the plan selects the particular tractor or truck or thresher or feed chopper or other piece of machinery he is buying and pays a certain amount on the purchase in cash, giving to the dealer, by whom the sale is made, his note for the balance of the purchase price. The Western Farm Credit Company then takes this note over from the dealer and attends to the collection, giving the dealer the cash. The plan applies to all tested and approved makes of tractors, the Credit Company having no interest in any particular tractor. The necessary note and contract forms are provided free of cost by the Credit Company, which makes a small charge made for collecting and cashing the farmer's note.

The plan is of mutual helpfulness. It gives the farmer his machinery at once, enabling him to put it to work earning dividends for him while it is being paid for. It gives the dealer his cash, enabling him to keep his capital free for use in his business, and also enabling him to do a much larger business than would be possible if he sold only on an "all cash" basis.

This plan supplements and does not compete with the service rendered by the local banks. Banks are limited by law in the amount of money they can put out in any one class of investment, and while they have been giving much assistance to tractor buyers, they have not been able to meet the demand at all seasons of the year and still provide for the needs of their other customers. Furthermore, banks prefer short time loans, whereas a full twelve months or two season period seems necessary in buying tractors. Also, it has been proven advisable, in transactions of this kind, to divorce the financing and collecting features from the sales feature. "Getting the paper out of town" results in more harmonious relations for all parties.

All of us must give every possible assistance at this time to help win the war. We are told that food will do it, and tractors and other power machinery will help produce that food. With this plan in effect no responsible farmer need complain of the shortage of help. His local dealer, if at all patriotic, will meet him half way and help him to make use of the Western Farm Credit Company's plan and thus one more blow will be struck at the Kaiser and his Huns.

Information concerning the time-sales plan referred to by Prof. WICKSON will be gladly furnished on application to:

Field and Garden Suggestions

[Written for Pacific Rural Press.]

Dried Vegetables Replace Fresh.

One New York restaurant recently ordered 1000 pounds of California dried spinach per month for ten months from the E. Clemens Horst Co., according to Frank George, who has general supervision of the vegetables. Eastern and Western hotels, restaurants, steamship lines, and householders are increasing their demand even in the season of growing vegetables. This is because the fresh vegetables in cities are not always so fresh, while you can almost taste the dew on the dried vegetables, as Mr. Horst says, because they often are cleaned and drying within two hours from the time they are pulled or picked. Labor scarcity increases demand for dried vegetables because they are already cleaned and ready for cooking, which avoids the need of much domestic labor. The light weight and lessened space required for transportation and storage are also advantageous over the dirty wilted fresh vegetables that would otherwise have to be used. The dried vegetables are put up in tight cartons, avoiding the excessive cost of tin plate, which is making canned vegetables expensive.

The Horst Co. is operating two driers in British Columbia and five in California. Their combined capacity is roughly over 300 tons of fresh vegetables per day, this varying according to the kind of vegetable. An experimental plant in San Francisco is trying every kind of suggestion on drying that may be proposed. Dried fish, meat, vegetables, and flowers are produced here.

A recent development is the grinding of various vegetables more or less finely for more convenient handling and quick cooking. At the Horst offices may be seen samples of ground carrots, green dried beans, green dried peas, celery, peanuts, potatoes, etc. Powdered soup is a step in advance of this, as mentioned in another article.

Grain Seedbed Irrigation.

The most successful way to prepare ground for grain in the Tulare Lake region is to plow dry as soon as grain is off, then irrigate and randall, then seed at the proper time, says S. G. McQuiston, a tractor driver of long experience here. If the ground is clean of weeds, it may be irrigated before plowing, since water is cheap and the extra evaporation by this system would be compensated by easier plowing. But if irrigated late in the fall, ground is likely to remain too wet to work until spring. The system of irrigation is to make great checks, many of them covering more than a square mile each. These are filled with water and it is likely to be a month before plow outfits can get on. One man began irrigating about October 1 and was unable to plant until March; while if he had irrigated a month or two earlier the grain would have been growing all winter.

Fertilizer Demand Active

Carlot market quotations on the plant foods in commercial fertilizers are now about $8 to $8.50 per unit for nitrogen (as ammonia), about $1 to $3 per unit for phosphoric acid, and about $6 per unit for potash, according to W. N. Liebler of the Hawaiian Fertilizer Co. A unit is 1 per cent of the total weight. If there are five units of nitrogen in a fertilizer, there will be 100 pounds of nitrogen per ton of fertilizer. There is a brisk demand for fertilizers, which will continue until spring, says Mr. Liebler. The Hawaiian Co. is keeping its factories in Honolulu and San Francisco busy night and day. Many progressive farmers are ordering ahead for spring delivery to insure having the fertilizer when it is wanted. Results of the applications last fall, winter and spring on potatoes, prunes, and other crops in various parts of the State have shown up well this season.

Beginning with Bees.

To the Editor: With sugar so scarce, I want to keep some bees for honey, but I don't know even how to start.—Subscriber.

[Manager W. B. Dickenson of the Apiary Department of the Diamond Match Co. says that honey production pays with extracted honey at 7c a pound, and that 21c is being offered for immediate delivery. He believes there will be a great boom. Prices in 1909 were the lowest ever, 2¾c per pound. Extracted honey has generally sold at 5c to 7c. A novice should either begin with a few colonies and increase as experience justifies expansion or obtain employment in a successful established apiary. Be sure that your employer is not one of those who are getting only one-fourth as much honey as they ought. When you know the business, you can go in as heavy as you wish.]

Save Burlap and Bags.

New burlap imported by the United States now costs about $150,000,000 annually, of which at least $100,000,000 is ultimately paid by American farmers for grain, feed, fertilizer, produce bags, etc., according to the U. S. Food Administration. Imports of burlap cloth by the United States normally average about 700,000,000 yards annually. Any waste of burlap or bags adds to the national demand, which causes an economic pressure for shipping from India. Saving burlap or bags will help save shipping to supply American armed forces abroad. Sell second-hand bags unpatched, as the manufacturers have special facilities for mending torn bags and they prefer to do it.

New Burbank Wheats.

Luther Burbank has been breeding, selecting, and fixing seed wheats for the past eleven years, the growth on his plots having been marvelous as seen by the writer. Last year he distributed small quantities to various ranchers and had baking tests made. The results have led him to put three varieties on the market this season. Comparisons with other wheats have shown two of them far excelling in yield the others of 68 varieties tested. One variety is white and has a hardness and weight "like granite."

San Joaquin Beans.

San Joaquin county's bean yield will be a little less than that of 1917, when almost double the normal acreage was planted, as reported by Farm Adviser Ralph D. Robertson. Last year part of the acreage, however, was not adapted to beans. Much of the decreased yield this season is laid to red spider and dry weather, since the acreage is about equal to that of last year.

Cheap Bean Bags.

Bean bags at 25¼c f. o. b. San Francisco for the 100-pound size and 20½c for the 80-pound size are being furnished by the California Bean Growers' Association of Stockton to its members. This is cost price; but there are only 100,000 of the larger size and 50,000 of the smaller ones, so first come first served.

Rye Grass Crowds Foxtail Out.

Where alfalfa has failed to come thick, W. P. Slusser of Sonoma county has found it very fine to sow Italian rye grass in the fall. It prevents foxtail and produces a fine quality of hay, which, thinks Mr. Slusser, gives butter a fine nutty flavor.

Watch for Registration Day

The President of the United States will soon announce by proclamation, a Registration Day to be held as early in September as possible.

More than 2,000,000 men are needed to put our army on a 5,000,000 men basis. 13,000,000 are expected to register.

Class one is nearly exhausted. This Class must be replenished from new registrants not later than October 1st.

Who must register:

All men from 18 to 20 years of age, inclusive and
All men from 32 to 45 years of age, inclusive, should watch closely for the President's Proclamation, definitely designating who must register.

Where you will register:

In the customary voting precincts in the jurisdiction of your Local Selective Service or at other points to be designated.

Sick and non-resident registrants:

These will be furnished cards by their Local Boards. The sick will be registered by persons deputized to do so. Non-residents may register by mail through the County or City Clerk of the place at which they are stopping. Special provision will be made for felons, persons awaiting trial and others confined in jails or institutions.

The Government of the United States asks your hearty co-operation with your Local Board in making the registration a complete 100% catalogue of every man of the ages to be announced in the President's Proclamation. Selection will take place later by the usual classification method.

The penalty for failure to register is one year imprisonment and NO man can exonerate himself by the payment of a fine.

PACIFIC RURAL PRESS

Fewer Men, More Food Production

[Written for Pacific Rural Press.]

Increased acreage farmed per man is one of the ways by which we can make up for our great losses of manpower. But because of the greater distance that must thus be traveled by man, beast, and implement, it may not be the most economical way to speed up food production with less manpower. Certainly it is not the only way. At least two others are open.

First and quite important is the diversion of farm acres and efforts from non-essential products to real food products. A list of non-essentials and of the less essentials would show up a lot of people who are making money because the Food Administration permits them to fritter away their time and acres on non-essentials while the world is hungry for real food. This may be excusable where their products are such as require a term of years to bring to profitable yield, provided there is reasonable hope that after the war such products will be in profitable permanent demand. But all non-essentials which do not fall in that class should be cut out at once in favor of products that will help win the war and keep the world from real hunger.

Of equal importance are less waste and greater production per acre of real foodstuff. It is proved by the experience of a limited number of your neighbors that certain practices and investments enable them to produce more per man and per acre than the average and to make a greater net profit per man and per acre. Reduction of waste work, waste land, and wasted products may well claim first attention. Then it will be worth while to turn to greater production per acre. Frequently greater production is merely a matter of timeliness of operations, with no increase in cost. Frequently a 10 per cent increase in investment brings a 20 per cent increase in profits. This is especially true with machinery and irrigation. Frequently increased production results from increased efficiency of workers due to decreased stomachage of certain non-essential products of the land which ought to be banned for this reason also. In all ways all who owe allegiance to America will seek and work and plan to avoid waste acres, efforts, and products and to increase production while manpower is decreasing.

Grain Growers' Organization

[Written for Pacific Rural Press.]

The Grain Growers' Association Committee on Permanent Organization met, August 22, with Market Director Weinstock and studied the advantages of stock and non-profit organizations as adapted to grain growing. In the afternoon they met at the University for further information, and afterward met alone to discuss their project. The committeemen present were Dr. W. H. Walker of Willows, temporary president of the association; G. H. Winton of Livingston, W. G. Hill of El Centro, J. L. Davis of Madera, R. S. Seydel of Lincoln, Elmer Sisson of Red Bluff, Martin Kuster of Wheatland, J. H. Harlan of Woodland, and A. E. Lindstrom of Orland. It has been pointed out that while most California organizations handle crops of which California has a near-monopoly, the grain growers will be competing with the world and may need affiliation with a national organization of the same nature. In their private meeting, the committee voted 4 to 4 on the general proposition of a stock corporation form of organization such as the raisin, prune, and peach growers, or a non-profit form such as the orange, almond, and walnut growers have. They have taken tentative forms of both kinds of organization back to their counties for further conference with grain growers and will meet again in Sacramento, September 6, to formulate their recommendation to the general grain growers' association which will meet in Sacramento, September 7. All members of the committee want letters or visits from grain growers promptly, stating points that should be included in the organization.

Bean Growers at Farmers' Convention

[Written for Pacific Rural Press.]

A nation-wide conference of farmers will have been held August 27 to 29 in Washington at the request of the Federal Board of Farm Organizations. The delegates will represent large organizations from all over the Union. They will give the Government the fullest assurances of the farmers' determination to produce the food that is to win the war, and they will in return request assurance that in all matters of price fixing they will have a voice, as well as the middleman. President George A. Turner of the California Bean Growers' Association has been asked to address the conference. He says in part: "California produces about half of the beans grown in the entire United States and we were this year urged to plant freely in order that our army and navy and those of the allies might have plenty of beans. While we were not enthusiastic about the prices then being offered, and although we had to face a labor shortage, we planted beans as we never planted them before. This was fortunate; for 1918 is not a good bean year and production per acre will fall below that of 1917. However, the increased acreage will probably balance the short yield. Our organization includes about 1000 growers, representing millions of dollars of invested capital, and we naturally feel that the Government should consult us when it seeks to arrive at a fair price for the 1918 crop."

Truckee-Carson (Nev.) Project Booming

[Written for Pacific Rural Press by D. L. Schrader.]

The Truckee-Carson project appears to the writer to be in the most favorable condition of any district of California or Nevada. Five years ago there were but half a dozen autos in the colony. Now it is safe to say that 75 per cent have already advanced beyond the Ford stage. Payments on the land are being promptly met and everyone seems to think he is past the hardest pull. Late in August the second cutting of alfalfa was yielding two tons per acre on many ranches. The first cutting was still heavier generally. Most of the hay was contracted early in the season at $14 to $17 in the stack, but $20 to $22 is being offered, and baled hay is selling for $27 f. o. b. shipping point. Having Lake Tahoe as their source of irrigation, water is plentiful. Very little grain is grown in the Fernley or Fallon districts, but a large acreage is being harvested in the Stillwater and Carson Lake sections. Wheat is running a ton to the acre in most places. Barley and oats are doing well, too. Some barley has been sold for $45 per ton f. o. b. Fallon. No sugar beets were planted on account of the labor situation. A large acreage grown last year yielded too little on account of lack of labor.

Drainage is still quite a problem, but the Government is doing good work in some places and there is a movement on foot to bond the project and make a thorough job of drainage.

Samson

GMC TRACTORS SIEVE-GRIP GMC TRACTORS

Tractor

Model S-25

THE GMC SAMSON SIEVE-GRIP TRACTOR is pleasing thousands of owners. It will please you. For nearly two decades it has been subjected to acid tests and has met them all successfully. Designed for service, simply, correctly and honestly constructed, it has more than made good the claims of its manufacturers. As a result, the demand for GMC SAMSON SIEVE-GRIP TRACTORS is constantly increasing.

Why experiment when you can secure a tractor, time-tested, that has demonstrated its ability to meet any and all tractor requirements on the farm, from plowing and cultivating to the hundred and one odd jobs?

The GMC SAMSON SIEVE-GRIP TRACTOR, during its many years of service, has firmly established a record for strength, durability and economy, combined with great simplicity of construction and operation.

It performs the work of ten horses and does it better, more economically and quicker, in fair weather or foul, day in and day out.

We are sure the GMC SAMSON SIEVE-GRIP TRACTOR will please you. Ask the man who owns one or write for our booklet, "Better Farming."

Grain Roots Forage Six Feet Deep

[Written for Pacific Rural Press by R. E. Hodges.]

About 450 pounds of water are taken up by a grain plant in California to produce one pound of dry grain and straw where the soil is rich enough so the water taken up by plants is pretty well saturated with plant food. Where the soil is not so rich, more water is required per pound of dry matter produced in the plant. This is equal to about four acre-inches of water per ton of grain and straw produced. This much water must actually pass through the grain plants. It does not include evaporation or water that drains downward beyond reach of the roots or runs off by surface drainage. Evaporation from cultivated sandy loam planted to corn at the Utah Agricultural College nearly equalled the transpiration (water which passes through the plants); and evaporation from uncultivated soil was nearly twice the transpiration. These ratios would vary widely with soil and the character of preparation and cultivation, but are worth while to start from. It is apparent that to get a maximum crop of barley, for instance, about four acre-inches per ton of grain and straw produced must be supplied to the roots in addition to enough to compensate for evaporation. Enough water should be put into the soil for these purposes; but any excess is not only useless for crop production, but is likely to be injurious either by expelling necessary air from the soil or by carrying fertility downward or away beyond reach of the roots.

Where physical and moisture conditions of soil are right, annual plants and cereals go six or eight feet below the surface and use the plant food as well as the moisture stored there.

There are subirrigated grain lands in California, there are irrigated grain lands, and there are grain lands where there is enough rainfall every ordinary year to raise a full crop of grain. But the greatest proportion of grain acreage is under conditions where all rainfall must be carefully husbanded to secure maximum crops.

WATER IS LIMITING FACTOR.

The plowsole of California grain land, with the exception of adobe, is notorious. Its sinister effect on the hunger of the world is many sided. Its very hardness prevents storage of moisture in that six or eight feet of soil where the roots might forage. It prevents access of air to enable bacteria to make the plant food in that subsoil soluble in the water required to carry it to the right place in grain plants. It spreads the roots sidewise to form a network in the surface three or four inches of soil where similar roots have been feeding and leaving more or less poisonous by-products for half a century. The roots cannot go where adequate moisture is lacking. The limiting factor in grain crop production is not rainfall nor fertility, but inadequate soil moisture largely due to plowsole. Not to plowsole alone, however, for continuous cropping without return of organic matter to the soil has all over California reduced the humus content. With humus gone, soil runs together when it gets wet and results in a more or less waterproof condition of surface soil also, which causes rainfall to run off by surface drainage. The soil cannot absorb and hold half the water it could if well filled with humus. More humus then is desirable for production of good crops on old grain ranches. But it is said by grain growers that they cannot plow straw under for humus because it will not rot. That trouble can only be removed by plowing deep enough to cover the straw in moist earth. But this addition to humus is not generally available in 1918 on account of the demand for straw for feed and bedding.

RESERVOIR THE RAINFALL.

The same remedy will knock out the plowpan, provide a deep soil reservoir to hold moisture for the biggest kind of a crop, open that subsoil to air and the work of bacteria, and permit grain roots to range in a new country long since discovered by their ancestors but locked against succeeding crops by the plowsole. Figure what this means. If barley can still produce 15 sacks per acre in four inches of wornout soil, can it produce more when its roots forage in 64 inches of soil that has been protected from them by plowsole these many years? If the moisture that can be stored in four inches of surface soil exposed to evaporation can mature a fair crop of grain, could the moisture in five or six feet supply a thicker stand producing heavier straw and bigger heads?

DEEP PLOWING OR SUBSOILING.

Two ways are possible to apply this remedy for plowpan. Deep plowing by tractor before the rains and afterward, leaving the land rough to catch and hold the rains until just before seeding time, is one way. It is not immediately a good way where the subsoil is worse than the surface soil in physical condition, humus, or possible fertility. Where plowpan is broken and mixed with surface soil by deep plowing, there may be even a decreased crop because it takes a year or two to soften, and meanwhile it prevents the compacting of soil enough to keep it from drying into clods. With deep plowing, some means of compacting the soil before seeding will prove necessary. This may be by rain if there is enough of it and enough time before seeding, or it may be by compacting implements, of which there are several on the market.

But the plowsole may be broken and the subsoil opened to air, bacteria, moisture, and plant roots without mixing any of it with the surface soil, which must be fine and supplied with available plant food in order to give the seedlings a start. Subsoiling has proved the means of doubling grain crops the past season on many fields in California, not only where plowpan existed but also in the adobe rice fields planted to grain on account of weeds.

BIRDS TOOK PEA SEEDLINGS.

Because garden peas did not come up when they should, W. A. Reubold of the California Seed Co. thought the seed was bad. But before complaining, he dug up some of them. They had all sprouted, but where they came through the ground, birds had picked them off in the morning before Mr. Reubold looked at them. Some people prevent this trouble by laying mosquito netting over the seedbed. Some blame the seedsman.

J. A. Bunting of Mission San Jose sold 250 tons of red oat hay for $25.50 f. o. b. Irvington. He also sold 100 tons of wild oat hay for $20 per ton.

See Lalley-Light
In Action at the Fair

Lalley-Light will be exhibited, and in operation, at most of the county and state fairs this fall.

We ask you to note particularly the way it runs, and the character of the electric light and power it produces.

If you will do this, we count on the plant itself to convince you of the superiority it has proven in eight years of every day farm use.

You probably will be impressed, first, with its extremely smooth running; and the fact that a low hum is all you hear when it is running.

You will see that the electric lights are strong and steady all the time—without even a suggestion of a flicker.

You will observe, also, the same steady flow of power to the electrical machines which may be exhibited.

The men in charge will explain that Lalley-Light furnishes light and power from two sources—the storage battery; and the generator, independently of the battery.

That means with Lalley-Light you are doubly sure of having light and power.

Even if you are not of a mechanical turn, you can't help admiring the unusual simplicity of the plant, and its very compact design.

We urge you to study Lalley-Light, because it points the way to a great saving of farm labor and an equal increase of comforts and conveniences on the farm.

Next year the farmer's need for Lalley-Light's reliable, economical power and light will be even greater than this year.

You should prepare now to meet that need.

If Lalley-Light should not be displayed at your home fair, write to us for details and name of the nearest Lalley-Light merchant.

LALLEY-LIGHT
THE ELECTRIC LIGHT AND POWER FOR EVERY FARM

Agricultural Notes

Many pear growers around Lakeport and Kelseyville are drying their own pears.

Canada's wheat crop is estimated to be one and three-quarters millions bushels less than last year.

The sales of table grapes and deciduous fruits jointly bid fair to reach a total this season of about $70,000,000.

The Pioneer Fruit Company plans the erecting of a packing plant in Healdsburg previous to next year's packing season.

The corn crop about Lakeport is good and anyone who likes roasting ears can find especial delight in making a hog of himself.

Manteca sugar beet growers sold their beet tops at $3 per acre last year, the yield being about 10 tons per acre, according to W. J. Woodward.

The Government estimate of the commercial apple crop for the United States is 24,285,000 barrels. The same crop for last year was 22,419,000 barrels.

Fallon, Nevada, is to have an agricultural short course, September 2 and 3, to hear and discuss lectures on soils, dairying, livestock, alfalfa, fruit, potatoes, poultry, packing and marketing of fruits and vegetables, home canning and bread making.

In 1912 the raisin pack of California amounted to about 95,000 tons. A conservative estimate places the production this year at about 175,000 tons.

Large quantities of Fresno county wine grapes have been bought at prices ranging from $25 to $35 a ton for Eastern shipment. Earlier in the season buying was done on a $22 a ton basis.

The apiary department of the Diamond Match Co. was organized only four years ago, but is now the fourth largest bee supply manufacturing plant in the world, according to the Chico Record.

In spite of the dry season, a big wheat crop is being bound in Carson Valley, Nevada. Some of it yields as high as 25 sacks per acre. Barley was planted too late in most places and is yielding light.

Plans for the year-round operation of the plant of the California Associated Olive Growers, Inc., at Oroville, under lease to the Pacific Packing Corporation of Boston and New York, have been announced.

Spain has authorized, in addition to special permits previously granted, the exportation until the end of the current year of 20,000,000 kilos of olive oil, one-half of which shall be allotted to North and South America.

This is the dryest year that Carson Valley, Nevada, has seen for many years. It is estimated that the alfalfa and wild hay crop will be 25,000 tons less than last year. Surely this will be no place to dispose of California feeder cattle.

The sugar factory is running full capacity at Manteca, and the quality of beets is reported very good.

Four hundred and thirty-four sacks of barley on 12 acres; 313 sacks of oats on 10½ acres are reported by A. Raymo, manager of Brae Bourne ranch, Santa Rosa, as an example of good soil and proper cultivation.

Early & Hart of Imperial county have ginned their first picking of volunteer short-staple cotton. Seven bales were sold at 30c and four bales at 32¼c. About 12 acres of the 35-acre field are estimated to have two bales per acre.

M. Burleson, a cousin of Albert Sidney Burleson, Postmaster General, has purchased the R. W. Elmiston ranch of 160 acres near Sanger. The vineyard is one of the finest in the country. The consideration was $80,000.

HOME-MADE SYRUP FROM BEETS

To the Editor: Can you give me a receipt for extracting the juice out of sugar beets to make syrup for home use?—R. D., Aptos.

[In making syrup the topped beets are cleaned by soaking a few minutes, then scrubbing with a coarse, stiff brush. The next step is to cut them into slices as thin as one-sixteenth of an inch if possible. A butcher knife may be used, but a kraut cutter or some other slicing device is easier. The sliced beets are placed in a tight barrel and just enough hot water to cover them—boiling water, if possible—is poured in at once. The barrel is then covered with several thicknesses of canvas to hold the heat. The sliced beets are allowed to soak for about 60 minutes. The barrel is agitated from time to time without being uncovered. The process brings out the sugar from the beets. The liquid is then drawn off, strained through several thicknesses of cheesecloth, and placed in a kettle or other vessel, in which it is boiled slowly until it has evaporated down to the thickness desired. It is important that the boiling be slow and the process will take several hours. The work may be done out of doors if desired. Care should be taken not to scorch the syrup. The scum which rises to the surface of the liquid is skimmed off, to remove the strong, beet-like flavor. The syrup is bottled or canned while hot and sealed to prevent molding. It is dark in color, but has a pleasant flavor. A bushel of beets will produce three to five quarts of syrup.]

Gardner's Bean Harvester

meets the requirements of the rancher and is within easy reach of all.
Ask your dealer about it, or send direct to factory.

Gardner Harvester Co.
902 E. Fourth St., Santa Ana, Cal.

The Big Third Annual Tractor Demonstration

Begins September 17th

Five full days of intensely interesting features are scheduled. There'll be a special program every day of the mammoth meet---some event of vital interest to the food producer will be taking place every minute of the day. This will be positively the biggest exhibition of modern farm machinery, tractors, implements and ranch necessities ever arranged.

Exhibition Tents will cover 60 Acres
One Million Dollar Exhibition
150,000 Visitors Expected

YOUR DUTY

is to attend this important Demonstration so that you can become familiar with every late development of modern ranch equipment.

THE DATES--September 17, 18, 19, 20, 21

THE PLACE--Whittier Boulevard--Half mile east of Los Angeles city limits

No Admission **Free Auto Parking**

Plenty to eat at the Restaurant——Quick service——Moderate Prices

TRACTION ENGINE & IMPLEMENT DEALERS ASSOCIATION

of Southern California

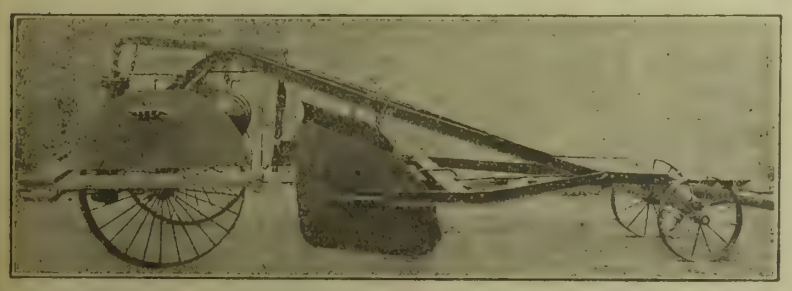
220 H. W. HELLMAN BUILDING, LOS ANGELES

We Manufacture Levelers for Any Power From 6 Horses to a 75 H. P. Tractor

A Schmeiser Leveler

of the "Giant" Type

WILL WORK WONDERS ON YOUR FARM



Moving immense amounts of dirt daily, and working on ground too tough for horses and Fresnos to tackle, SCHMEISER POWER LAND LEVELERS are now being used with utmost success by a great many ranchers, large and small—also by contractors—saving their owners time, labor and money.

WE SEND THEM ON THREE DAYS' TRIAL.

So extremely simple, a child could operate one, as a simple twist of the wrist raises and lowers the bucket or holds it stationary, as the case may require.

Send today for full information and our latest catalog of earth-moving machines.

Schmeiser Manufacturing Co.

12 Mechanic Street DAVIS, CAL.

Manufacturers of

Sure Pop Almond Huller and Separator, 3 sizes; McGarvin Fruit and Olive Graders, any size; Schandoney & Harrington Equalizing Hitches, any size; Diamond Special Harrows, Baker Clips, Clevises; and Schmeiser Portable Automatic Hay Derricks. We sell the Martin Ditcher and Grader.

LARGEST STOCK IN AMERICA
Decomposed.

Sheep-MANURES-Steer

Concentrated
In Perfect Mechanical Condition

Because of the shortage of manures in this territory it will be well to consider NOW your fertilizer requirements for the next twelve months. More carefully handled and prepared than other manures. From highest nitrogenous feed.

Steer Analysis		Sheep Analysis	
Available Nitrogen	1.58 to 1.75%	Available Nitrogen	1.75 to 2.00%
" Phosphoric Acid	.86 to 1.20%	" Phosphoric Acid	1.12 to 1.29%
" Water Soluble Potash	3.48 to 3.92%	" Water Soluble Potash	3.62 to 3.88%
" Humus	5.07 to 5.70%	" Humus	7.42 to 8.12%

Highest in organic, and free from foreign matter. Shipped commercial dry basis.—Saves four-fifths labor in application. Write for price and particulars today to insure prompt delivery.

Mechanical Power on the Farm

Users of tractors, engines, pumping plants, motor trucks, automobiles, electric motors, and other mechanical farm power are invited to make this department an exchange of their experiences and troubles

RELIEVING ELECTRIC SCARCITY

[Written for Pacific Rural Press by R. E. Hodges.]

Mountain water to run electric power plants of Northern and Central California became so scarce early in June that the situation was critical. The season had been dry. People who generally depended on gravity water had to pump. People who had depended on wells found the water-level lowered so it required more power to raise water to the surface. People who had never before irrigated installed pumps and many of them called for electric power. Irrigation alone took 10,000,000 kilowatt hours in May and increased to 15,000,000 during the summer months. No other user of electric power required more except the street and interurban railways, which, combined, used 21,000,000 kilowatt hours per month.

But there were people who could not get power, while there was a considerable waste of water that might have generated electricity in plants that were idle part of the time. For instance, one company might have three power plants under one reservoir, each using the same water that had run a plant above it. But at times only one or two of the plants would be needed to supply electricity required by that company's patrons. At the same time, another company might be unable to supply its patrons all they needed and crops were endangered.

To remedy such a situation and to protect war industries, the power companies pooled their resources in co-operation with Federal authorities and put it up to the Railroad Commission of California to work out the best combination of their resources and to make the mountain water last as long as possible. To handle this job H. G. Butler was on June 15 appointed State Power Administrator for all of California north of a line running northeast roughly through King City and a point eight miles north of Merced, thence to the summit of the Sierras. Five or six power companies operate in this section and the California-Oregon Power Co., operating also in southern Oregon, will join the others about October 1.

All of these systems have been connected so electricity from any of them may be sent via any other line if necessary to any district where a heavy load is demanded. Use of electricity has been curtailed in several ways; so by these two means it is hoped that the water supply may last until nearly time for the rains. Meanwhile every steam plant for production of electricity is running full blast day and night.

As irrigation is essential, it is hoped that use of electricity for this purpose will not have to be curtailed. Interurban trains have been reduced, street railways are skipping some of their former stops, street lights are being reduced to the minimum of public safety, one-third of the power used by gold dredgers has just been voluntarily relinquished, cement plants' power has been cut in half, and the patriotic breweries, running a food-destruction, labor-destruction business, have given up half of their power.

As the demand for electric current is less at night than in daytime, all irrigators who can are urged to pump at night and lighten their requirements during the daylight hours.

HOME-MADE SUDAN THRESHER.

To the Editor: As I have seen many valuable suggestions in your paper, I offer my experience threshing Sudan grass. My son had a small patch and no way to thresh it. We put an old 1½-inch mower shaft through a wooden block 13 inches long and 14 inches in diameter. Two ⅜-inch holes had been bored through the block crosswise of it. Holes to match were drilled through the shaft so that pieces of hayrake teeth driven through them would lock the block to the shaft. We set four 7-foot posts 4 feet in the ground in a 2x4-foot rectangle and bolted two 4x6's 4 feet long horizontally on top of them, level both ways and parallel about two feet apart. On the 4x6's we put boxings made by hollowing out pieces of 2x4 6 inches long. The block and shaft were supported in the boxings and babbit poured around the shaft. We put a 6-inch pulley wheel on the shaft and belted it to a 12-inch wheel on a gas engine. With the block rotating, there was no trouble to make it round with a wood chisel. We marked thirteen circles around the block nearly an inch apart and divided each circle into nine parts. Heads were cut from 60-penny nails, which were driven into the block in alternate circles, with the points out, so there were nine rows of nails running lengthwise of the block. In alternate rows we had seven spikes; in the others, only six, which were in the alternate circles. They were then curved like any threshing teeth. This made a threshing machine cylinder 13 inches long, 14 inches in diameter, with nine rows of teeth corresponding to those on cylinder bars. A groove around each end was wrapped with 12 or 15 rounds of baling wire so it would not burst. Then we put in four rows of concave teeth and put a top over the contrivance. Looks like an old chaff piler of fifty years ago, when Dad threshed wheat with a flail, but it beats the flail. We threshed 2130 pounds of Sudan in two and a half hours and did as clean a job as anybody, only we had to clean the seed in a fanning mill. After threshing the Sudan we put the big pulley on the cylinder and the little one on the engine and threshed 350 pounds of beans in twenty minutes, and you could hardly find one cracked bean.—J. W. Richman, Gilroy.

AUTO TRUCKS FOR BULK GRAIN.

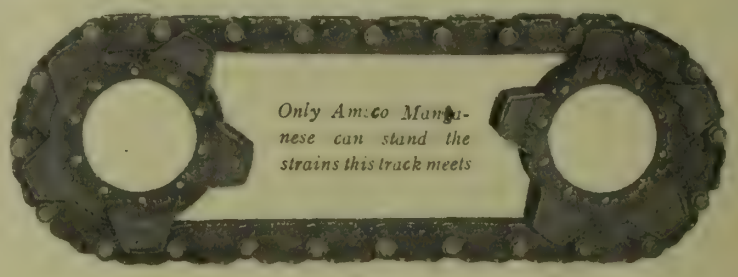
Hauling bulk grain from three combined harvesters in the field five miles to the elevator, Andrew Kaiser of Glenn county is using ten wagons and a motor truck. All are fitted with hopper-bottomed bodies. Eight of the wagons are run in pairs with one driver and six horses per pair. Two are pulled singly by four light horses or brood mares each. Bins on the harvesters hold somewhat over two tons when full, and each wagon has equal capacity. The truck holds about seven tons of grain, according to its driver. It is a simple matter to drive up to a harvester when its bin is full, pull a slide and let the grain shoot into the truck body—except that it does not shoot very well because the top of the truck body is eight feet above the ground—too high to permit enough slope from the harvester bin. The truck, operated by one man, hauls as much grain as three or four wagons and makes twice as great speed on the road. It makes the round trip in about an hour. It dumps much faster than three or four wagons. The truck driver can deliver about four times as much grain as any other driver; but at noon he doesn't have to feed a bushel of good grain to his machine. Similar comparative experience on a larger scale last year by Moreing Bros. of Sacramento county led to the use of trucks only, during the present season. That is another story.

One of the first pumping plants to be installed in Carson Valley, Nevada, is saving feed and livestock for the Dangberg Co. of Minden, who run 20,000 sheep and 10,000 beef cattle. They are short about 3000 tons of hay, but are saving a lot by running a centrifugal pump with a Yuba tractor for irrigation.

The One Enduring Metal for Crawler Tractors

THE track of a Crawler type tractor meets gruelling service. It must be constructed of wear-defying metal. Otherwise, you have constant repair bills and loss from an idle tractor during the busy season.

"Amsco" Manganese steel is as superior to carbon or alloy as hickory is to the soft pine. It increases tractor durability by giving you a track that practically defies wear. It is the most satisfactory metal that has ever been discovered.



"Amsco" Manganese Steel Is Found on Leading Crawler Type Tractors

Tractor makers are fast adopting "Amsco" Manganese. It is proof against abrasion and friction and when used as track metal it stands the wear of constant rubbing against the soil.

Tractor Parts That Should Be Made of Amsco Wear-Defying Steel

"Amsco" is the "Steel of Endurance" for

Shoes	Links	Pins
Grousers	Rollers	Lags
Spacing Blocks	Sprockets	Chains

Transmission Gears

In Wheel Tractors it is the metal for bull gears, pinions, sprockets and transmission gears.

See "Amsco" at Sacramento and Los Angeles

Many "Amsco" equipped tractors will be exhibited at the Sacramento and Los Angeles demonstrations. You will find these tractors among the leaders in each class and price. May we not mail you new issue of "Amsco Tractor Parts Bulletin"?

AMERICAN MANGANESE STEEL COMPANY
McCormick Building, Chicago, Ill.

Tractors equipped with "AMSCO" parts are on sale by the following dealers:

W. L. CLEVELAND CO. (MONARCH TRACTORS)

C. L. BEST GAS TRACTION CO.
YUBA CONSTRUCTION CO.

AMSCO
WEAR-DEFYING STEEL

GREATEST MACHINE AND TRACTOR EXHIBIT.

Three hundred and fifty acres are devoted to the Los Angeles tractor demonstration which is to take place September 17 to 21. For the public demonstrations, in which every one of more than 50 tractors will plow at the same time for an hour each afternoon, the amount of land assigned for each tractor is allotted in proportion to the manufacturers' drawbar horsepower rating. Individual demonstrations will be in progress from 8 a. m. to 5 p. m., except at noon and during the public demonstrations.

The greatest farm machinery exhibit ever staged in California will be shown on 60 acres in connection with the tractor demonstration. Besides all of the members of the Traction Engine and Implement Dealers' Association of Southern California, about 100 firms will exhibit equipment of every kind for Western farming. It pays to keep up to date and no place or event can equal the Los Angeles demonstration for this purpose.

NILSON ROLLER-WHEEL TRACTOR.

A five-wheeled tractor newly on the California market has three rear drive wheels placed roller fashion so they bear least pressure per square inch on the ground yet give greatest traction surface for a wheel tractor. It is the Nilson, made in Minneapolis and handled in California by D. A. Linthicum of Stockton. The seat is between engine and rear wheel. Its Waukesha motor develops 30 hp. About 40 of these machines are working in the Turlock and Porterville districts and one is expected to be shown at the State Fair.

DAUCH MANUFACTURING HEAD KILLED.

The automobile driver looked back to see if a trolley car was approaching. The left wheels of the machine ran into a shallow ditch. Trying to swing back and avoid a telephone pole, the automobile swerved so sharply that it overturned. J. J. Dauch, president of the Dauch Manufacturing Co., and the driver were both killed. The manufacture of Sandusky tractors will be continued along the lines Mr. Dauch so successfully built up.

POWER NOTES.

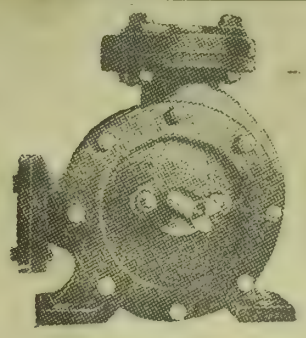
Tool sheds haven't risen in price nearly so fast as farm machinery.

Alfalfa was disked and sowed to barley after the first rain on Aaron & Brown's ranch in Sutter county to provide early green feed or hay and to crowd out weeds from first-crop alfalfa.

The Holt Manufacturing Company of Stockton is working its immense Caterpillar plant in that city day and night, employing 2200 men. Only two sizes of tractors are being made, the 75 and the 45.

The Pacific Gas and Electric Co. has asked the State Railroad Commission to investigate the fares charged on their forty-four miles of street railway in Sacramento and make new rates that will yield a fair return on investment. The lines are valued at $2,057,981, on which last year the net revenue was $63,941 to cover depreciation and return on investment.

IRRIGATION PUMPS



"Piatt's Wonder Pumps"

Grand Gold Medal Awarded, California State Fair, September, 1916.

WILL PUMP WATER AND AIR AT THE SAME TIME—NEEDS NO PRIMING

Any kind of power may be used, which is an advantage in many cases. It weighs less than any other pump, and takes up less room. It is wonderfully elastic in operation. Will pump either a large or small amount of water without decreasing speed.

PIATT'S WONDER PUMP is the most economical pump manufactured for irrigation purposes.

Proper Methods of Milking

[Written for Pacific Rural Press by R. H. Whitten.]

HOW CAN we make a cow let down her milk? We treat her gently, and she has great capacity."

This question from a subscriber was recently published under our "Veterinary Queries" and readers were invited to answer. No suggestions have been received, so I want to take a whack at this subject, not so much to prescribe a remedy for the trouble in this particular case as to give the proper methods of milking, which, if followed, will prevent cows from forming such bad habits.

An advertisement recently appeared in The Dairy, a paper published in London. It was headed "The Artificial Cow Udder," and readers were told that the advertiser had invented an udder of canvas with soft rubber teats. The canvas was filled with water, and the operator sat down to it and "really" learned how to milk. The ad also stated that no person could milk successfully without training the hand and arm, and that this method responded to and demanded exactly the same movements from the hand as the natural udder of the cow.

Think what a wonderful invention this is! Think of the far-reaching benefits to the dairyman! No longer need he worry about the shortage of experienced milkers; no longer need he have good cows spoiled by beginners. When a milker leaves he merely needs to send to the city and get one of these carefully trained operators, who, although he may never have seen a live cow before, will take hold like an old-timer—yes, even better, for he'll do it the scientific way, with just the proper hand and arm movements.

Sounds great, but let us hope that the contrivance will never come across the ocean. For the one who treats a cow as a mere machine, instead of a highly organized living mechanism for the conversion of feed into milk, is not going to get the flow of milk that should result from all of his hand and arm movements.

MOTHERHOOD THE BASIS OF MILK PRODUCTION.

Too few dairy-farmers recognize the basis of milk production—the motherhood of the animal furnishing the milk. The giving of milk, beyond that required by the calf for a few months, is purely an artificial function, and only to the extent that a milker can take the place of a calf in the affection of the cow will she reward him at milking time. She has it within her power to retaliate against any unkind treatment by withholding her milk, and no matter if every movement of the milker is made exactly according to his instruction book, she will not do her best unless he understands her nature and knows how to keep her in a pleasant mood.

This is because the cow possesses a highly developed nervous system with which the secretion of milk is closely associated. Consequently, whatever reacts on the nervous system of the cow will react in like degree on the secretion of milk.

This does not mean that the attendant merely needs to refrain from harsh treatment. Probably the average milker is not unkind to his cows. He has learned from experience that it does not pay to yell at them or pound them with the milking stool to make them mind. But that is not enough. He must go further and satisfy their natural desire to be petted. The cow is a sensitive animal, responsive to attention, and her affection must be gained before her maximum flow can be secured.

There must be sympathy and understanding between the cow and the milker, but it must not be pretended sympathy on the part of the latter. A dairy cow has an instinct that quickly tells her whether or not her attendant likes her. It seems to tell her just what is in his heart, and if she finds affection there she will reward it at the milk pail. When you see a cow that happens to be fastened loosely at the neck, reach around and affectionately lick her milker as she would her calf, then you may know that a bond of sympathy and understanding has been established, and you may be sure that the man will get all the milk that anyone can get.

This practice of milkers taking whatever cow happens to be next in line is a bad one. Each cow should be milked by the same person at each milking.

START THE HEIFER RIGHT.

Most cows that kick and hold up their milk acquire these habits during their first lactation period—generally when they are being "broken" to milk. But a heifer should not be broken, and if she is treated kindly while a calf and a growing yearling and then is handled like a cow before freshening, there will be no such thing as breaking her to milk. She will take it as a matter of course.

The springing heifer should be put in with the milking string several days before she freshens, and should be driven into the dairy barn so that she will become accustomed to a stanchion and to the presence and touch of her attendant. Begin by patting her and speaking encouragingly to her, then rub her udder gently and handle her teats carefully without squeezing them, and soon you will have her standing like an old cow to have her udder manipulated.

Also, if her calf is to be left with her for three days or so, she should be accustomed to haltering so that she can be tied in her stall and her udder can be worked on.

Nature trains the heifer to expect the muzzling and pushing of the calf, and the manipulations of the teats by the milker should be similar to the first attempts of the calf. However, both gentleness and patience are necessary, and if the udder is hard or tender to the touch no attempt should be made to force her into quietness by blows or angry words.

Don't tie her legs to prevent kicking or to make her stand still. Don't attempt to get her into position by pushing the leg of the stool into her flank or kicking her on the shin to make her step back. Teaching a heifer how to stand properly is not the easiest task in the world, but a slight pressure on the front or back of the leg, as may be necessary, coupled with plenty of patience, will accomplish more than harsh methods.

THE CORRECT WAY TO MILK.

The milker should be seated squarely on a substantial stool from ten to thirteen inches high, and just far enough from the cow so that his arms will be almost fully extended when milking her. His finger nails should be well trimmed, and he should milk with dry hands. The cow should stand with her right hind leg set back, so that nothing but the hands of the milker comes in contact with the cow. The pail should be held between the knees of the milker and not more than six

Holding Up the Nation's Defense

The telephone played a tremendous part in this Nation's mobilization for war. It continues vital to the Government's program.

At the same time it has remained at the service of the whole people whose demands upon it grow apace with that of the Government.

The public is entitled to the best service that it is possible to render. But the public has a partnership in the responsibility for good telephone service.

It takes three to make any telephone connection: the person calling, the company, and the person called. Without the co-operation of all three the service suffers.

The telephone company can make the connection, but no words can be heard at one end of the line which are not properly spoken into the transmitter at the other. The relation between the speaker and the hearer is the same as the relation between the orator and his audience. It cannot be maintained if the orator turns his back to the listeners or if the audience is inattentive.

Telephone traffic must be kept moving. Speak distinctly—answer promptly—and release the line as quickly as possible. Don't continue reading when the bell rings.

These seem little things to ask the individual telephone subscriber, but when the individual is multiplied by millions all over this country, it is easy to see how important it is that *all* should co-operate.

Reduced Rates for State Fair

Director General McAdoo of the U. S. Railroad Administration has issued an order that all railroads shall make a round trip passenger rate of one and one-half times the present one-way rate for all State fairs. If your local agent has not been informed of this, have him take the matter up with the regional director of your section, so that you can get the reduced rate.

inches below the teats.

The milk should be drawn by pressure of the full hands encircling the teats. The udder should not be swayed or pulled downward, but should be held almost motionless. The milk works down into the teats during the process of milking, and a muscle at the end of each teat contracts and prevents the milk from running out of its own accord. So the milker must grasp a teat in such a way as to prevent the milk from going back into the udder when the teat is squeezed, and at the same time the milk must be forced out. By grasping a teat with the full hand and closing on it with the thumb and fore finger first, the milk is held in the teat, and then by closing in succession the second, third and fourth fingers it is forced out. Of course, when once learned, all of the movements are made mechanically.

Care should be taken to move the fingers properly so that the milk is always driven downward, and never by accident forced upward. A sudden lurch or kick or withholding of milk may often be attributed to this, as upward pressure is liable to cause pain.

Usually a cow lets down her milk more readily in her rear quarters and yields more heavily from them, so milkers generally milk them first. But if this is done the cow is liable to develop an unbalanced udder, and as a rule milk from the fore quarters should be drawn first.

All the milk that is let down into a teat should be drawn with each pressure of the hand, and the milking should be done as rapidly as possible without being rough. Fast milkers, who make the milk fairly boil in the pail and raise a lot of foam, get more milk than slow milkers. This is probably due to the greater stimulation of the udder. A few gentle pressures upward as the flow begins to slacken will bring almost the last drop of milk, and little stripping will be necessary.

IMPORTANCE OF THOROUGH MILKING.

However, this does not mean that the milker should stop as soon as the milk ceases to come fast, for not only is thorough milking of the greatest aid in developing the mammary glands of the cow and increasing the capacity for production, but it is a case where "the last is the best."

Complete milking will result in getting from a half pint to a pint more milk at each milking. The last half pint of strippings will test from 10 to 15 per cent, while milk from the average cow tests only about 4 per cent. This makes a pint of strippings worth 1½ quarts of average milk.

A half pint of milk may seem a small amount to leave in the udder at a milking, but in a lactation period of ten months it will amount to over 300 pounds of milk, and it will contain over 40 pounds of butter, worth over $20. Now suppose it takes you ten hours extra during the lactation period. This pays you at the rate of $2 per hour for your time. Pretty easy way to make money, isn't it? And the best part of all is that while you are increasing your profits you are also increasing the capacity of the cow.

MAKE REGULARITY YOUR WATCHWORD.

Regularity must be made your watchword in order to get the best results. There should be a fixed time morning and evening for milking, and the periods between milkings should be as nearly equal as possible. Also, the cows should always be milked in the same order. A cow soon comes to know when her milking hour arrives and she expects to be milked then. If disappointed, she probably will withhold part of her milk and may develop the habit of withholding it regularly.

A change of milkers may have a good or bad effect. Two milkers may be equally efficient, yet one may be able to get more milk from one cow and the other may excel him on some other cow. So the best plan is to find which cows each milker can do the best with and have him milk them regularly. They will become accustomed to him, and if he is the right kind of a milker they will learn to love him. He will never sit down to milk one of them without first gentling her a little; he will always use low-spoken, soothing words.

And not only will the most nervous cow stand contentedly for him in the barn, but out in the pasture she will come at his call to have her head scratched and perhaps be given a carrot. She will try to lick his hands and clothes, and express in her way her appreciation of his kind treatment.

Sentimental? Perhaps. But if so, it is a case where sentiment can and should be mixed with business. The dairy cow is a mother. Treat her with the same kindness and consideration that you would show to a human mother, and you will be amazed at the results.

Dr. Verdo B. Gregory, a prominent physician and owner of the Joseph Hospital at Joseph, Ore., has recently put in a $10,000 foundation herd of Aberdeen-Angus cattle at his ranch at Oakdale, Cal.; also a notable foundation of Berkshires, most of the hogs being purchased from Winona Ranch, Grants Pass, Ore.

N. W. Thompson, the draft horseman of Patterson, has returned from Chicago with 16 head of Belgian and Percheron stallions, mostly two- and three-year-olds. They will be on exhibition at the State Fair. They are the best lot Mr. Thompson has ever handled, and as they have been winning at Eastern shows he expects to make a big killing with them out here.

It is announced that no more hand-knitting yarn can be manufactured in the United States, and the only yarn hereafter available will be what the Red Cross can buy from dealers. Also, no more wool will be allotted for civilian purposes. The reason for both restrictions is that the Government needs 900,000,000 pounds of wool this year and only about 280,000,000 pounds will be produced. Wool growers are not worrying about a market for their product these days.

"Slipping" not "Saving"

"I kept slipping back two feet every time I went ahead one." That's what the small boy gave as an excuse to his teacher for being late for school one winter day.

And that's just what is happening to the cow owner who is trying to get along without a cream separator or with an inferior or half-worn-out machine. Like the small boy he is "slipping." He thinks he is thrifty, but for every dollar he saves by not buying a De Laval he loses two through not having one.

It *isn't* economy to do without labor saving and money saving and food saving machines. It *isn't* economy to feed 40-cent butter to the calves and hogs.

It *is* economy to buy and use only the best cream separator made—and that's the De Laval.

Viewed from every standpoint—clean skimming, ample capacity, ease of operation, freedom from repairs, durability—there is no other cream separator that can compare with the De Laval.

It's real thrift and genuine economy to buy a De Laval Separator NOW.

Why not see the nearest De Laval agent at once! See a new 1918 De Laval machine for yourself. Try it to prove every claim made for it. If you don't know a De Laval agent write direct to one of the addresses below.

Feeding $80 Alfalfa to Steers

To the Editor: Would it be profitable to fatten range cattle on alfalfa instead of cutting and selling it baled, when hay will sell around $30 per ton?—D. Gerster, Jr., Redlands, Cal.

[Answered by Livestock Editor.]

Experiments conducted when alfalfa sold for $10 per ton showed that it cost $3.92 per 100 pounds of gain. With alfalfa at $30 per ton this would make the cost $11.76 per 100 pounds.

Not very encouraging at first thought, yet there are four factors that should be taken into consideration: First, the alfalfa will not cost you $30 per ton. Second, your cattle have been on range and it has not cost you much to bring them to finishing condition. Third, by marketing your alfalfa through the steers you will get nearly a ton of manure per month from each animal, valued, according to the present prices of farm products, at from $4 to $6 per ton. Fourth, you should consider what the price of beef cattle will probably be when yours are ready for market, rather than the present price. In all probability, after the grass-fed stock has been cleaned up, shipments will not be so heavy and the price will raise to correspond.

If you can supplement your alfalfa with straw, silage, corn stalks, beet tops or beet pulp, together with a little cottonseed meal, you will be able to reduce the feeding cost and make a satisfactory profit. Chopping all feed used will eliminate the waste and still further increase your profits.

Glenn County for Durocs

[Written for Pacific Rural Press.]

A highly commendable and strictly business-like system of Duroc-Jersey propaganda is being carried on with gratifying success in Glenn county by H. P. Slocum & Sons of Willows. As a result, State Fair visitors will be delighted by a splendid exhibit of seven futurities from Glenn county and two from Butte county, among the other Duroc hogs that will be shown.

The writer had the pleasure of seeing most of these futurity litters and he is glad not to be the judge. The 36 pigs in the nine exhibits are of wonderful uniformity and excellence. Their exhibitors are mostly youths, but all are people for whom Clayton M. Slocum has bought pigs or sows from the East or to whom he has sold from his own herd. The exhibitors are C. W. Scott, C. D. Bright, and Hedges & McMartin, all of Glenn; C. W. Smith, H. P. Slocum & Sons, and W. H. Manis, all of Willows; W. B. Bennett of Nord, and Hollingshead & Sons of Orland. Some of these will show other Durocs besides the futurities, but the latter have been leaders in the interest of their communities.

Mr. Slocum has attended to the registration papers and entry in the futurities, and has also acted as adviser on feeding and fitting. The exhibitors are all enthusiastic, and determined to make their sections famous for Durocs. This is Mr. Slocum's aim and one object of his activities. His slogan is printed on the auto truck he drives about, "Glenn County for Durocs."

But it is not enough to get farmers all around him interested in raising more and better hogs. Mr. Slocum is depended upon to find a market for the surplus of his new clients. This he does in his personal contact with prospective buyers and visitors to the ranch and by advertising his clients' stock along with his own under his own name. Eventually they will strike out independently, but, at any rate, within a short time anybody will be able to buy carloads of the best Duroc blood in this one community.

To Tell the Age of Sheep

[Written for Pacific Rural Press.]

The age of sheep may be determined fairly accurately by means of the teeth. Sheep are classified as lambs up to twelve months old. During this period lambs have temporary or milk teeth, which are distinguished from the permanent teeth by their being narrow, small and of a pure white color.

At about one year the first pair of permanent incisors replaces the central pair of milk teeth on the lower jaw. (Sheep have no incisors on the upper jaw.) These permanent teeth are wider and longer and of a yellowish color.

When two years old the second pair of permanent incisors replaces the next outer pair of milk teeth. At three years the third pair appears, and at the end of four years the sheep has four pairs of permanent teeth, or a "full mouth." Sheep are said to reach maturity at this time.

After the "full mouth" period is reached the only means of telling the age is by the degree of wearing and sometimes the protruding of the teeth. After about six years sheep begin to lose their teeth and are spoken of as "broken mouthed" or "gummers." Such sheep cannot pick up a living on the range, but if they are put on alfalfa, or even used to clean up the waste of the average farm, they will be good for two or three more crops of lambs before they outlive their usefulness.

How to Measure a Hog

[Written for Pacific Rural Press.]

Now that the show season is about to begin, you will be seeing prize-winning hogs, or at least reading about them. Often their measurements will be given and naturally you will want to measure your own hogs to see how they compare with these winners. So here's the way to do it.

For the length, have the head down and measure from a point between the eyes to the root of the tail. For the heart girth, measure around the body just back of the fore legs, having the tape straight up and down. For the loin girth, just in front of the hind legs, with the tape perpendicular. For the circumference of the leg, commonly referred to as the bone measurement, measure around the hind leg in the largest part between the hock and the pastern. For the height, have the hog on a board or cement floor at the side of a building or partition. Place a board over its back horizontally and mark where the under side of it strikes the wall, then measure the distance to the floor and you will have the height of the hog.

TRY THIS TO SECURE HELP.

Having trouble getting satisfactory help? Next time you go to town get your grocer, meat man or druggist to paste a little sign on his window stating that a farm hand is wanted. If you have time, hang around for awhile. If not, have the dealer tell applicants what time to meet you there. You will be surprised at the number of replies you will get, and the men will be of a much better grade than those you find hanging around saloons and pool halls.

My Range Bulls are Shorthorn Show Bulls

All of them have been at the Fairs and have generally won something. Their get are uniform, vigorous, and hardy, raised to service age on the range. King Lancaster, three times Grand Champion at the State Fair and now 13 years old, is still getting fine calves. My bulls won Grand Championships every year for eleven years (1904 to 1914, inclusive), except 1907, when I showed only calves. I have a breeding herd of 400 cows and can supply service buls in car lots, but they are going fast. Write me your wants pretty soon or come and see.

When to Dry Off a Cow.

To the Editor: Should a cow be dried off before she freshens or milked right up to calving time? My neighbors advise both ways.—C. A. R., Orange Cove, Cal.

[Answered by Livestock Editor.]

Your cow should be dry for at least six weeks before freshening—eight would be better. When a cow is dry she uses the feed that she previously used for milk to store up flesh to draw upon after she freshens. If she is not given this opportunity to build up a reserve, she will shrink after two or three months instead of keeping up a heavy flow for nine or ten months. While she is dry she should be fed generously. You will find that the extra cost of feed, above the old starvation method, will be paid back to you many times over in the milk pail during the next lactation period.

Suspects Distemper.

To the Editor: I have a collie dog that has some lung trouble. After running a short distance he stops to cough and gag, sometimes bringing up a little frothy matter. His nose is warm but moist, breathing rather rapid, has good appetite but is in poor flesh. Is this distemper?—R. S. M., Hanford.

[Keep the animal's bowels open by giving a two-grain tablet of extract of cascara, rub the chest well with camphorated oil, and apply a jacket over the chest and throat. Avoid much exercise.]

A Quittor.

To the Editor: My horse has a bad foot. He had thrush badly, and the frog continues to keep sore. When I trim it only a little it bleeds. The trouble occurred between the foot and hoof and discharged at the edge of the hair.—E. S., Ukiah.

[Your horse has what is termed a quittor. No treatment you could give will relieve it. Treatment is surgical entirely. Keep it clean. You may inject iodine tincture once every other day.]

Scar Hardened.

To the Editor: I have a horse whose fore foot was cut by barbed wire. The scar has become very hard. Do you know of anything that will soften it?—W. F. H., Kellogg.

[If the fetlock has not enlarged, apply nothing but a bland oil, such as salad oil, once a day.]

BEET PULP GOOD FOR STEERS.

The Colorado Experiment Station recently completed tests which indicate that beet pulp is a valuable feed for beef cattle. One lot of steers was fed alfalfa, cottonseed cake, beet pulp and molasses. Another lot received silage instead of beet pulp. The former gained 1.9 pounds per head per day, the latter 2.3 pounds. Thus the pulp-fed steers gained .4 of a pound daily per head more than those fed silage, and they sold for $1 per cwt. more. Also the gains made from silage were more expensive than those made from beet pulp.

If farmers in the Corn Belt can afford to ship Western steers hundreds of miles east for feeding on a silage ration, then California feeders who can get beet pulp ought to make barrels of money.

But remember, there was not enough beet pulp to go around last year. If you expect to use any this year, you had better place your order right away. Don't put it off.

SAN FRANCISCO MILK PRICES RAISED.

Owing to the increased cost of production and distribution, Commissioner Merritt of the Food Administration has granted an increase from 12c to 14c for grade A pasteurized milk, effective September 1.

It was at first planned to arrange a zoning system for distribution, so that only one wagon would cover each district, and it was estimated that the saving in the cost of distribution would be enough to offset the increased cost of production, so that no raise in price would be necessary. But this method was found impracticable for the present, so the price will be stabilized for the coming year, unless unforeseen emergencies arise which may force either a reduction or an increase.

DON'T FEED HIGH-PRICED GRAIN TO WORMS.

Have you treated the hogs for worms lately? They are particularly bothersome at this time of the year and are in many herds where they are not suspected.

If you do not keep before the hogs constantly a tonic which contains worm preventives, you should use an expellant at regular intervals. To be sure that each pig gets its share, try 2 grains each of santonin and calomel, put up in a capsule. Give after the pig has been without feed for a few hours, and allow one capsule for every 50 pounds of live weight. Watch the droppings and you will be surprised at the worms you will find. There is no worm medicine more effective than this mixture. It is rather high priced, but its effectiveness more than offsets the margin.

GIVE THE HOGS A SCRATCHING POST.

If you haven't a dipping vat or are too busy to use it, give the hogs a scratching post and let them do the work themselves.

Set a fence post firmly in the hog pen, coil a rope around it as high as a hog will stand and fasten the rope on securely with staples.

Then thoroughly saturate the rope with crude oil. Coal tar dips can be used, but they evaporate rather quickly. Crude oil lasts, and with it you will have an ideal scratching post, where the hogs can rub and grunt to their hearts' content and rid themselves of lice and scaly skin.

GOVERNMENT URGES LIBERAL USE OF LIGHT WEIGHT BEEF.

On account of the extreme drouth which is endangering the meat herds in the great cattle producing sections, cattle runs are 50 per cent heavier than last year at this time. Most of the stock is below the normal market weight, and to create a market for it the Food Administration has rescinded the regulation which curtailed purchases, and now requests the more liberal use of beef from cattle which dress under 475 pounds.

This will cause a conservation of the heavier cattle needed for our soldiers and for export to our allies, and at the same time will increase the outlet for cattle raisers in the drouth afflicted areas.

TUBERCULOSIS STILL PREVALENT.

Tuberculosis is still extracting its heavy toll from California hog raisers. The Western Meat Company's records show that the average price they paid for hogs in July was $16.75, while if none had been condemned for tuberculosis they would have been able to pay $17.63—a difference of 88c per 100 pounds.

When tuberculosis can be stamped out of a herd by comparatively simple and inexpensive methods, it seems strange that so many hog raisers remain indifferent and cheat themselves out of their rightful profits.

Live Stock and Dairy Notes

Livestock breeders all over the State are invited to send, on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.

The Dairy.

C. C. Slater of Pacheco recently sold a Holstein bull to Boch Bros. of Pacheco and another to Mrs. Mary Fuchs of Pleasanton. Proof that Mr. Slater's hérd has a good reputation right at home.

Bridgford Company of Knightsen has commenced building on the recently acquired ranch at Patterson and intends to move its noted herd of Holsteins as soon as the new buildings are completed.

W. J. Higdon, owner of the Tulare Holstein Farm, is planning on building a model 16-stall testing barn. In addition to the usual equipment of such barns, he will include electric fans for the comfort of the cows.

Jesebel of Edgemoor, in the herd of registered Guernseys at Edgemoor Farms, owned by Walter H Dupee of Santee, recently completed a year's work of 12,434.9 pounds milk and 748.32 pounds fat, giving her second place in class F.

Green-Hill Caroline, a second calf heifer in the Dairy Shorthorn herd of Alexander & Kellogg at Suisun, has produced 10,000 pounds of milk in nine months and her calf weighs 765 pounds. Convincing proof of the merits of this dual-purpose breed.

The McCloud River Lumber Company of McCloud secured their foundation stock from the leading Eastern herds, and have a large number of animals of excellent blood lines, including young stock sired by Sir Pietertje Ormsby Canary and Sir Bonheur Hengerveld Ormsby.

The annual meeting of the California Holstein-Friesian Association will be held Tuesday evening, September 3, at 8 p. m., in the office of Chas. W. Paine, Secretary State Agricultural Society, Fair Grounds, Sacramento. Every good and faithful Holstein breeder should make a special effort to attend.

Heifers entered in the first yearly futurity stake of the California Jersey Breeders' Association must freshen and start on their register of merit work before January 1, 1919, under thirty months of age. Final payment of entry fee is due at time of starting on test. Kerma of Venadera and Lucile of Venadera, both in the herd of Guy H. Miller at Modesto, are the first to qualify and enter the contest.

Foundation stock for two new purebred herds of Ayrshires have been received in Nevada. W. F. Sauer of Franktown recently received six head of bred heifers and a choice bull from J. W. Clise, Redmond, Wash. The stock is rich in the blood of that famous Ayrshire, Peter Pan. The Dangberg Co. of Minden received 16 head from Mr. Clise and expect to build up a modern dairy herd on their place. Plans are being drawn now for a model dairy barn.

Beef Cattle.

The Berryessa Cattle Co. of Monticello has purchased 23 purebred unregistered Hereford females from W. D. Duke of Likely, to raise bulls for their own range stock, according to Superintendent L. Stoddard.

Clinch & Peters of Chico and Quincy are fitting a carload of great Hereford steers for the Oakland Meat Co. to show at the State Fair. They have a registered Hereford herd at Quincy and a registered Shorthorn herd at Chico.

A meeting of cattlemen will be held at the Travelers Hotel, Sacramento, Thursday morning, September 5, at 10 a. m. The meeting is primarily called for what is known as Zone No. 2, which includes nearly all of the northern half of the State, but it is hoped that as many as possible from other zones will attend.

Shorthorn breeders will have a get-together evening at Sacramento during State Fair week to discuss plans for the ensuing year and to devise ways and means to increase the output in order to supply the demand for more and better beef cattle.

Simon Newman Company of Newman, have 180 registered Herefords, and have raised an 80 per cent calf crop this year. They report a heavy demand for breeders and have already sold all surplus stock. They are among the very few in the State who have plenty of feed.

Swine and Swinemen.

J. E. Thorpe of Lockeford will show 11 head of Durocs, including a futurity litter and two sows that are corkers.

R. J. Yates of Orland is offering Poland-China gilts as special prizes at the Glenn County Fair, to be held at Orland, September 16 to 21.

Anchorage Farms, at Orland, recently shipped Berkshire boars to William Stewart of San Diego, Mrs. Belle Rhodes of Monterey, and A. N. Blacmer of Midvale, Utah.

The Poland-Chinas of P. E. Mitchell of Atwater are in the pink of condition, and 10 head will be shown at the Atwater Fair, September 13 and 14. Mr. Mitchell has recently sold two service boars and two weaned pigs.

Geo. I. Lytle of Perris has had such good results from purebred stock that he is determined to have nothing else on his ranch. He now has about 40 registered Hampshire hogs, and flocks of bronze turkeys and white Plymouth Rock chickens.

Frank B. Anderson of Sacramento reports the sale of a trio of Berkshire pigs to W. D. Howe, a milling man of Oakland, who will use them as a nucleus for a purebred herd that he is establishing at his ranch near Aptos, Santa Cruz county.

The Western Duroc-Jersey Association will have its second annual dinner at the Travelers Hotel, Sacramento, at 7:30 Monday evening, September 2. An excellent program has been arranged and every breeder of the great red hog is urged to attend.

Red Rock Ranch of Glen Ellen, owned by R. Q. Wickham, has a fine lot of Duroc youngsters and will show a futurity litter at the State Fair that will be hard to beat. The pigs were so uniformly good that Mr. Wickham had the time of his life picking out the best litter.

Sheep.

Bullard Bros. of Woodland will ship 25 head of registered Rambouillet rams and 75 range rams to the annual sale at Salt Lake City this fall.

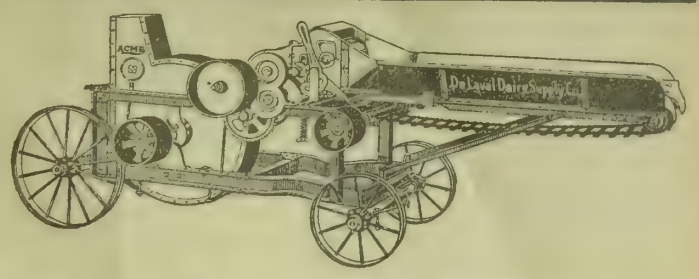
EL DORADO HERD OF HOLSTEINS — Alex. Whaley, Tulare, Cal.

Chop Your Dry Feed

10% to 25% of Hay Fed in Bulk is Wasted
Chopped Feed is All Eaten



The ACME Cutter

THIS Combined Silo Filler and Feed Cutter will pay for itself in one season on dry feed cutting alone. Makes fine alfalfa meal.

PRODUCES A UNIFORM CLEAN CUT SILAGE

A Light Running Steel Frame Cylinder Cutter. Built for Hard Work
BUILT IN SEVEN SIZES. GET THE CATALOG

IDEAL GREEN FEED SILOS

Leak Proof. The Safest Silo Investment. Permanent

Do not make the mistake of buying a "cheap" silo, or "cheap" silo material. You cannot save money that way. Silos that are offered to you with emphasis on their low price are expensive and wasteful. They do not preserve the silage as well and do not last as long as an Ideal. Every dollar you invest in an Ideal brings greater returns than money invested in any other. Our silo catalog explains its superior construction.

GOING TO THE STATE FAIR?
Make the De Laval Booth your headquarters.

De Laval Dairy Supply Co.

61 BEALE STREET -:- SAN FRANCISCO

HENGERVELD DE KOL BLOOD. High producers. T. B. King, Visalia.

MULE FOOT HOGS, large type; booking orders for spring litters. These are the farmers' easy feeding, profit-producing kind. Meet me at the Fair. H. T. Bailey, Box 37, Lodi, California. "The Blue Gums."

Poultry for Profit

BRINGING THE PULLETS ALONG.

This is another line of the business of making profit out of poultry that is much neglected. Generally the pullets are left to rustle what they can from the feed thrown out to a flock of mixed ages, sizes and sexes. This is all to the bad and means loss both of feed and time. Pullets should all be separated from old hens and from cockerels, and put in separate yards according to size and age. The early pullets can be easily made to lay and bring in a profit by right feed, while if the same feed is fed to immature or younger pullets a good portion of it will be thrown out of the system as waste because they cannot use it economically. When the pullets begin to make comb they can stand good feed until they commence laying, because they need to store up vitality and healthy muscle. Give all grain fed to them in a deep litter, or if none is at hand sow the grain in the earth and let them dig it out. Keep a pan of sour milk and a pan of water in a shady place, not forgetting to scald the milkpan out every day. Keep a hopper with good beef scrap, another of grit and shell handy, and throw granulated bone in the litter with the grain. Sprouted grain is best because every bit of it is digestible, while if barley and oats are fed dry there is a loss in fibre which the hens cannot digest. It is not necessary to buy high-priced mashes in order to bring pullets into laying condition. Plenty of mineral is obtained from plant life. Give plenty of good clean sand when it is possible to get it. Milk contains the proper amount of acids and lime that the system needs. The protein for eggs must be obtained from all these elements both mineral, vegetable and animal; but the main supply of protein comes from the grain or mash fed and the animal food. Put the materials before the pullets and make them exercise, and they will balance their rations themselves.

CHICKS BUNCHING UP.

Chickens, like garden truck, are growing fine since cool weather set in, but there are a few things that need watching. On cool nights chicks are likely to bunch up if left to themselves. This should be prevented by finding out how many are in one coop or house, if they are left to run loose. If too many are rooming together, take part of them away and shut them up in another coop for a few days until they forget the old coop. Young growing chicks are not hard to break in to new quarters. Just a few days' close confinement will reconcile them to a change.

LICE AND MITES.

Another thing to look out for is head lice. If growing chicks are running with older fowls, they will get them, no matter how careful you may be. The only remedy is to go around at night and powder their heads. It is not always necessary to treat each one individually. If you have a good powder, go along at night and dust the bunch. If you use a blower, blow against the feathers and sufficient will penetrate to drive the lice on top, then blow again over the back and once on the floor. If you just shake from the can, rub your hand over the chicks and put extra powder on the floor and backs. Enough of it will get in to drive the lice out. There has been less complaint this year from lice and mites than ever before, so I am flattering myself that my continual harping on one string is really doing some good.

CLEAN UP.

This is the best time in the year to attend to leaky poultry house roofs, cracks in the walls, dirty, foul floors—everything that, if neglected now, may be forgotten later, until the mischief is done. Sometimes a small crack or a dripping roof will start a whole flock with catarrhal colds that may not be noticed; then the change from colds to infectious roup is so quickly and easily made that one wonders how it all happened. The roof or crack caused it. There's a cause for everything; nothing merely happens. The observing farmer and poultryman looks for the cause and stops it. Filth in a poultry house or yard, draught striking a hen or two that has been weakened by a season's heavy laying are causes that start lots of things. Chickens coming out into the cool morning air and bunching up cause trouble. Why not have a little grain covered up in a patch of soft ground and let them dig it out for exercise. This scatters them, warms them up, and as soon as the blood begins to circulate they forget all about bunching up.

OLD-FASHIONED ROUP.

To the Editor: My chickens' faces swell and their eyes close. They live for about a day or two, then die.—B. M. C., Templeton.

[This sounds like old-fashioned roup. Get a box of bromo-quinine pills from druggist and give each bird affected one pill. Then dip her head in a can of coal oil and water, two-thirds coal oil to one of water. As you withdraw the head from the can there will be sufficient oil adhere to the head and face to do the work. Clean up your pens, separate the sick from the well ones, and scald out all feed and drinking vessels. Two or three treatments with pills and coal oil will suffice.]

BUMBLE FOOT OR RHEUMATISM.

To the Editor: My chickens get lame and sit around on their haunches or right flat on the ground. If they try to walk they limp along. I can't find anything wrong with them. What can I do for it?—O. C. L., Tulare.

[If your chickens are heavy and the roosts are high, they probably have got bumble foot. The remedy is to lower the perches. Heavy fowls should never perch over three feet from the ground, and two is better. If they do not roost high, it is rheumatism. Give them a teaspoonful of iodide of potassium, the dry powder, in one quart of water. Give this once a day and see that the chickens drink it before giving any more water. Keep it up about a week, when they will be better.]

POULTRY NOTES.

At the approaching Land Exposition the Coast breeders are making preparations to make an epoch in rabbitdom. The show will be represented by the best and biggest collection of rabbits ever held.

It is estimated by poultry specialists of Cornell University that poultrymen this year will receive profit only from the eggs which hens lay in excess of 108. It will take all returns from the latter number to pay expenses.

THE KEENEY SCHOOL

Boarding and Day School for Girls, 2200 21st Street, Sacramento, Cal., will reopen Monday, Sept. 16th. General and College Preparatory Courses. "THE HANDS THAT'S WINDIN' BANDAGES."

The evenin's that your're spendin'
Makin' blessin's for our boys,
In your thoughts—in years that's comin'—
Will come back to you as joys,
And the glory that you're gainin'
Will be yours forever more
Fer the hands that's windin' bandage
Is a-helpin' win the war!

And our boys what's goin' over
Won't feel bad when they git shot
Fer there's lots o' nice white bandage
An' a nice hos-pi-tal cot
Where they'll dream about the girlies
Who are windin' more an' more—
Fer the hands that's windin' bandage
Is a helpin' win the war!

You are givin' every moment
That you can—It don't seem much
But your bit you sure are doin'
Fer to help to whip them "Dutch."
While we hope they won't be needin'
What's already in your store
We will always know your windin'
Is the thing that won the war!

—Alfred J. Saunders.

ANNIE AND THE MOCKING-BIRD.

"It's too bad you've sprained your knee, Bobby," said Mrs. Brown, as she seated herself in the little living-room, after doing the supper dishes. "I wanted you to run over to Aunt Sarah's and get a skirt pattern for me so that I could cut out my work tonight and be ready to begin on it early in the morning." Bobby was sorry, too, and he said so, though he added bravely: "I could go anyway, mother. I could hop along and it won't hurt very much, besides it isn't far, you know."

"No, it isn't very far," answered his mother, quite positively, "but you are not going to run any risks with that sprained knee." Then she added thoughtfully, "I would go myself only I'm expecting your father to call me up over the telephone just any minute, and I don't want to leave the house at all for fear I might miss him."

Nobody looked at Annie Lee all of this time, and nobody made any signs at all of expecting anything of her, but still she felt sort of uncomfortable.

Her knee was not sprained, she was not expecting any one to call her over the telephone, and she was almost as old and as tall as Bobby Brown; besides, it was neither very far to Aunt Sarah's nor yet very dark outside.

Annie Lee was learning how to read, and she could read stories in story-papers when she tried very hard. She was trying quite hard now, and I am sure would have succeeded only that she couldn't keep her eyes fixed on the page. Her sight kept wandering to the open doorway, and through it, out into the gathering dark outside.

Annie Lee did not like the dark at all. It gave her a queer feeling, as if something big and soft and smothery were closing in all around her so that she couldn't get out at all.

She understood just how queer it made her feel, but maybe other people might think she was afraid, for she noticed that they never asked her to run out in the dark any more.

She didn't at all like people to think that she was afraid, but she was more and more sure every minute that some people did thing that.

Everything was quite still and nobody in the room said a word, and yet Annie Lee thought she could feel them thinking, "Don't ask Annie Lee to go; she's afraid of the dark!"

It isn't at all pleasant to feel that people are criticising you in their minds, and Annie Lee couldn't get interested in the story she was trying to read, so she sat quite still and did nothing at all.

Then she heard a noise outside,—a strange, wonderful, beautiful noise.

"Oh!" she gasped, and leaning eagerly forward in her chair she asked, "What is it, aunty?"

"What is what, child?" said Mrs. Brown, not looking up from her reading.

"She means the mocking-bird," said Bobby. "They don't have mocking birds where she lives."

"Where is he?" asked Annie Lee, gazing with a new interest out into the darkness.

"Oh, he's outside in the trees somewhere," answered Mrs. Brown, carelessly, as she went on with her reading.

Now where Annie Lee lived they were not used to hearing birds sing outside at night.

"Who's out there with him?" she asked at length.

"Nobody, goosy," said Bobby, "they sing at night lots of times."

"I sh'd think he'd be afraid," breathed Annie Lee, in a whisper.

"Why should he be afraid?" asked Mrs. Brown, laying aside her paper at last.

"Afraid of the dark," answered Annie Lee, so softly that you hardly could hear her.

Then Aunty Brown laughed merrily. "Why, child," she said, "there isn't anything to be afraid of. The dark isn't anything—it's just nothing at all—nothing but a big kind shadow that comes over the world to rest our eyes, and why should any one at all, even a little bird, be afraid of a shadow?"

That was a new thought for Annie Lee, and she sat very still while she thought about it, and listened to the brave little singer outside in the shadow.

Then she jumped up and said brightly, "I'll run and get your pattern, aunty."

Then before any one could say a word against it her willing feet were running down the path to Aunt Sarah's house, and all the way she was saying to herself, "Thank you, little bird, for not being afraid of the dark, for not being afraid of a shadow!"

Pretty soon she came safely back into the lighted room with the wished-for pattern in her hand.

"Thank you, dear," said Mrs. Brown gently. "Were you afraid?"

"Course not," answered Annie Lee, smiling brightly. "I'm a good deal bigger than a little mocking-bird.—Francis McKinnon Morton in the Sunday School Times.

Aeolian Player Piano
The Best Player Value At Or Near the Price
$545

To those that can't play but want so much to play the Piano—what a blessing is the Player! But the higher types of Player instruments are often beyond the reach of the average pocketbook. This is where the Aeolian Player Piano fills a great need—**it is a good substantial instrument yet moderate in price.**

The Aeolian Player Piano does not depend on any single sensational feature to command attention—**its excellence is due to a well balanced perfection throughout.** It is a product of the Aeolian Company, makers of the famous Pianola and the wonderful Duo Art.

We will gladly arrange convenient terms if desired.

We invite you to call at any of our stores—or write us asking for illustrated catalogues and prices.

We are dealers in Steinway and other Pianos, Pianola Pianos, Aeolian Player Pianos, Player Music, etc.

Agricultural Summary

Resume of State's Crop Conditions.

Barley, wheat and oats harvest is practically completed, with yields fair to good. Corn is making good progress, especially the sorghum varieties. Potatoes and truck crops are good, and excellent where irrigated. Ranges are poor to fair, but stock are in good condition considering the feed shortage. Rice and grapes are excellent crops, Muscats being especially heavy; Thompson seedless are going on trays. Hop picking is progressing. Almonds and walnuts are good crops. Deciduous fruit yields are fair to good; drying is progressing. Oranges and lemons are improving. Beans, sugar beets and tomatoes being harvested; tomatoes are an excellent crop, and beans are fair only owing to drouth. Sugar beets fair. The cotton crop is good to excellent; picking and ginning is progressing.

Curious Comparison About Tomatoes.

Approximately 75,000,000 cans of tomatoes were purchased by the Quartermaster Corps, U. S. A., from the 1917 pack. They are packed in what are known as No. 3 cans, which are 4⅞ inches in height, and it is the basis of these cans that the total length of the cans placed end to end was computel. From these figures it is elicited that this purchase was so large that if the cans were placed end to end the line would extend from the army on the Marne to Linda Vista, Cal. They would stretch from Seattle to New York City and back to San Francisco, thence to New Orleans, extending across the continent two and one-half times.

Packer and Country Hides.

A correspondent wants to know why "packer" hides command a premium over "country" hides. Well, it is due mainly to the fact that hides are more skillfully and carefully taken off the animals at the packing concerns and to the superior facilities these concerns have for curing and storing the hides when removed. The skinning knife wielded by the hand of an inexperienced person usually damages and detracts by so much from the value of the skin.

The Boom in Butter.

The movement of butter out of storage continues, which indicates that current production is not meeting the requirements of current consumption. A carload of butter from the Middle West was recently received and readily disposed of. Further shipments from the same source are expected. The forecast is, therefore, for much higher prices later in the year.

Some Outside Egg Markets.

A correspondent of the Rural Press sent in one day this week this survey of a few of the interior egg markets. He says: "Farmers were getting (August 24) 42c a dozen at Healdsburg, 51½c at Santa Rosa, 52c at Fulton, 41c at Woodland, 56c at Sacramento. We cannot reconcile the wide variations between nearby points."

California's Peach Production.

The importance of the peach growing industry in California is emphasized in the final Government estimate of the crop for 1918, which places it at 11,000,000 bushels—2,500,000 below that of last year. This is well over half the peach production of the country.

Sugar Crop Short.

It is announced from Los Angeles on good authority that there is a shortage of 25 per cent in California's sugar crop. The crop will amount, it is claimed, to 3,115,000 bags, while the normal crop is 4,700,000 bags.

Milk at High Tide.

Milk in Portland now costs the consumer $4 a month for a quart delivered. Butter is $1.15 a two-pound square. See notice of rise in San Francisco milk prices elsewhere in this issue.

THE MARKET REPORTS

Figures Given are Independent and Reliable.
Prices Quoted as Paid to Producers.

SAN FRANCISCO

San Francisco, August 28, 1918.

WHEAT.

Wheat is selling at the prices announced by the Federal Grain Corporation, and these prices will doubtless be maintained for the present crop. The prices quoted are for grain f. o. b. San Francisco, Los Angeles, Seattle, Tacoma and Portland, and guaranteed at least $2 per bushel f. o. b. shipping point. The price of sacks and sacking not included.

No. 1 hard........$2.20
No. 2........2.17
No. 3........2.13
No. 1 soft........2.18
No. 2........2.15
No. 3........2.11
Club or Sonora, No. 1........2.16
do, No. 2........2.13
do, No. 2........2.09

BARLEY.

The barley market continues dull and unchanged.

Choice feed, per ctl........$2.40@2.47½

OATS.

Oats are inactive and prices are nominally unchanged.

Red feed, per ctl........$2.50@2.65
Red seed........2.75@3.25

CORN.

Business in corn is nominal. Dealers say there is occasional inquiry but no sales.

(First-hand prices on strictly first-class grain, San Francisco.)

California sacked........$4.20@4.25
Milo maize........3.95@4.05
Egyptian........4.05@4.10

HAY.

Receipts of hay for the past week were 2067 tons. The larger part of the receipts were by boat from points about the bay. The congestion noted during the past few weeks was not so much in evidence. The Government placed orders during the week for its September requirements, most of which will be furnished by San Francisco dealers. The range of prices prevailing in this market are still lower than that of the country districts, considering the additional charge of freight. Warehouses in the city are practically full and all receipts must necessarily be moved direct to the consumers. This has had a tendency to keep values from any higher level for the present at least.

Wheat No. 1........$23.00@25.00
do, No. 2........20.00@22.00
Choice tame oat........24.00@26.00
Wild oat, new........19.00@23.00

do, second cutting........22.00@24.00
Stock........18.00@21.00
Barley straw........50@80c

FEEDSTUFFS.

Rolled barley and rolled oats were the only two active feedstuffs this week. The former sold off 50c and the latter showed an advance of from $3 to $4.

New alfalfa meal, per ton........$33.00@34.00
Coconut cake or meal........44.50
Cracked corn........86.00@88.00
Oilcake........$75.00@76.00
Rolled barley........52.00@52.50
Rolled oats........58.00@60.00
Bran, carload lots in S. F........23.75
Mixed feed, do, do........25.00
Middlings, do, do........25.75

POTATOES, ONIONS, ETC.

Both potatoes and onions showed a decided weakness this week and were sold at times at a somewhat lower figure than today's quotations. No more Merced tomatoes are coming into this market and the price of the bay description stiffened somewhat. Sweet potatoes are coming in in larger quantities and their price and range were lowered. Rhubarb and summer squash showed weakness and green corn and garlic showed strength.

Peas........6@8c
String beans, per lb........4@5c
Wax beans, per lb........4@5c

Tepary beans........8.00@ 8.50
Garbanzos........8.00@ 8.75

POULTRY.

Hens continue the feature of the poultry market and the demand is expected to continue for at least another week. Choice hens will undoubtedly bring a somewhat higher price next week. Broilers and fryers are both strong and quoted at slightly higher prices. Spring turkeys have not been in large demand and the price was lowered 2c. The entire poultry market is in good condition.

Firsts	46	46	46	46	46	Nom.
Extra pullets	53	53½	53½	54	—	56½

CHEESE.

As a usual thing the members of the San Francisco Produce Exchange do not deal to any extent in the First California Flats, as most of the retail trade demands the fancy description. However, when cheese advanced to its recent high price last week a demand developed for the Firsts. This transfer of demand had a weakening effect and when a call was made for California Y. A. Fancy the Fancy Flats began to recede and the price was reduced to 31c. Oregon Triplet Fancy was advanced to 31½c, thus becoming the leader in price in the list.

Fancy California flats, per lb........31c
First California flats, per lb........Nom.

FRESH FRUITS.

Apricots are now at about the end of their season. Cantaloupes also are nearing the end of their season. Some flats sold as cheap as 35c, but most were held to sell from 40c to 60c. The ponies and standards were also sold under last week's quotations.

Apples........$1.50@2.50
Apricots, per crate........Nominal
Peaches, 4-box crate........75@1.00
Figs, black, per box........None
do, double layer........$1.00@1.50

LOS ANGELES

BUTTER.

Los Angeles, August 27, 1918.

Receipts were somewhat better this week, 322,100 pounds against 365,200 pounds the same week last year. More or less sweet butter, however, is included in the receipts, and this is going into cold storage. Demand fairly good for all extras at steady prices. There was taken into cold storage during the week 19,423 pounds, making the cold storage holdings now 500,039 pounds against 291,762 pounds this time last year.

We quote—

California extra creamery........50c
do, prime first........49c
do, first........48c

Daily quotations—

	Tu.	Wed.	Thu.	Fri.	Sat.	Mon.
1918—						
Extra	50	50	50	50	50	50
1917—						
Extra	42	42	42	42	42	42

EGGS.

An active and rather snappy market was had the past week. The receipts by rail for the week were 761 cases, against 857 cases the same week last year. Receipts by truck continue to run about four times as heavy as the arrivals by rail, making the supply for the week 3806 cases, against 4285 cases the same week last year. There was withdrawn from cold storage during the week 3275 cases, against 2451 cases the same week last year.

Daily quotations:

	Tu.	Wed.	Thu.	Fri.	Sat.	Mon.
1918—

Case count	39½	42	42	42	42	42
Pullets	38	38	38	38	38	38

POULTRY.

Receipts fairly good, but high prices caused light consumption. Broilers in good demand, but fryers were dull; so were light hens and roosters.

The following prices were agreed upon last Friday, August 23, and hold good until the coming Friday:

Broilers, 1@1¼ lbs........33c
Broilers, 1½@1¾ lbs........33c
Fryers, 2@3 lbs........29c
Roasters (soft bone), 3 lbs. and up....29c
Stags and old roosters, lb........19c
Hens........20@27c
Tom turkeys........30@33c
Ducks........22@28c
Geese........15c
Squabs, live, per lb........30c
Squabs, dressed, lb........40c

VEGETABLES.

Market was well supplied the past week and fresh stuff was in fair demand. Cabbage is still scarce and high. Potatoes coming in more freely; market less firm. Onions are off under freer offerings, but demand is fair. Summer squash a little firmer, but slow. Cucumbers steady. String beans and corn steady and in fair demand. Peppers low sale.

We quote from growers—

Potatoes, local, per lug........75c@$1.00
do, do, per cwt........$2.25@2.70
do, northern, per cwt........3.00@3.10

Eggplant, Imperial Valley, per lb....4@5c
Cucumbers, home-grown, per lug..30@45c
Corn, per lug of 3 doz........65@75c

FRUITS.

Receipts were fairly liberal the past week and prices ruled a little lower. Demand fair for all fancy stock, but stale and off conditioned hard to move. Plums sell fairly; market a little lower. Peaches and pears both off under freer offerings. Figs coming in freely and a little lower. Quinces dull and also lower. Grapes coming in freely and market off all around.

We quote from growers:

Figs, Black Spanish, 7-lb. box........50@75c
do, White, 7-lb. box........50@60c
Peaches, freestone, per lug........75c@$1.00

Banana apples, 4-tier........$2.25

Apples—Alexanders, 4-tier..... 2.25
do, 4½-tier 2.00
Plums, per lb.....5@6c
Quinces, per lug.....60@75c

BERRIES.

The market was full of other fruit and berries were cheaper.

We quote from growers:

Strawberries—
Fancy, per 30-basket crate.....$2.25@2.50
Poor to choice, 30-basket crate. 1.80@2.00
Blackberries, 30-basket crate.... 1.80@2.00
Raspberries, 30-basket crate..... 2.75@3.00

MELONS.

Watermelons coming in freely and market weaker. Hot weather encouraged demand and they sold very well at last week's low prices. Cantaloupes coming in less freely and bring a little more money. Casabas slow sale and weak. Honeydew melons coming in more freely and bringing good prices.

We quote from growers:

Cantaloupes—
Tip Top, home-grown standard crate .....80@85c
do, do, pony crate.....50@65c
do, do, jumbo crate.....$1.75@2.00
Columbia, jumbo crate..... 2.00@2.25

Pineapple, standard crate .....80@85c
do, jumbo crate .....$1.75@2.00
do, Paul Rose, standard crate. 1.00@1.25
Watermelons, per 100 lbs..... .75@1.00
Honeydew melons, 16-inch crate. .90@1.00
do, jumbo crate..... 3.25@3.50

BEANS.

Beans are now being harvested. Buyers are holding back. Bids on limas were lowered to 11c.

We quote from growers:

Limas, per cwt.....$11.00
Large white, per cwt. 10.00
Small white, per cwt. 10.00
Pink, per cwt. 7.50
Blackeyes, per cwt. 7.00
Tepary, per cwt. 8.50

HAY.

The market is dull. Receipts the past week were good and demand light for all alfalfa and barley hay. Barley was especially hard to move and clearances hard to make. Oat hay is scarce and in steady demand.

We quote f. o. b. Los Angeles—
Barley hay, per ton .....$24.00@26.00
Oat hay, per ton ..... 26.00@28.00
Alfalfa, northern, per ton.... 21.00@22.00
Alfalfa, local, per ton..... 22.00@24.00
Straw, per ton ..... 9.00@10.00

Special Deciduous Market Report

By J. L. Nagle.

Sacramento, August 26, 1918.

Continued heavy receipts during the past week, coupled with the fact that about half of the offerings of Bartletts were ripe, resulted in all markets showing a sharp decline. Northwestern pears continued in fair supply and had a noticeable effect upon the sale of California stock.

Receipts of plums were not as heavy as the week previous and consequently the demand was in keeping with the supply and prices ruled steady.

There was a noticeable increase in the sale of California Elbertas in quite a few of the auction markets, due to the fact that speculators had bought several cars in the Middle West at a premium, hoping to re-sell in the Eastern markets at a profit. Their judgment, however, proved to be in error, as the prices realized showed that someone was facing a heavy loss.

The market on Malagas showed a slight decline, due to increased offerings, but as the stock is arriving in fairly good condition we anticipate that the market will be affected only by the proportion of offerings, but we look for an active demand throughout the season.

Few Tokays have reached the East, but shipments en route are fairly heavy. The stock is not up to standard as a whole, except from the Florin district. We look for an unusual demand for Tokays this season and predict unusually high prices.

The supply of refrigerator cars has been in keeping with the shipments, though it is predicted that there will be a temporary shortage for the next ten days. There is quite a supply of empty refrigerators en route West, but these will not be available until the latter part of next week. As there are about 12,000 cars of fruit and grapes yet to be marketed from California, we anticipate there will be plenty of cars to move the crop, though a shortage may develop intermittently during the season.

Averages for the week:

New York: Pears—Bartlett, $2.77; B. Hardy, $2.87. Peaches—Elberta, $1.05; Crawford, 98c; Tuscan, $1.11; Lovell, 80c; White Free, $1.10; McDevitt Cling, $2.15. Plums—Diamond, $1.69; Gros, $2.05; Giant, $1.76; Grand Duke, $2.19; Kelsey, $2.32. Grapes—Malaga, $2.21; Thompson Seedless, $1.43; Muscat, $2.75; Rose Peru, $2.15; Cornichon, $1.97; Tokays, $2.98.

Boston: Plums—Gros, $2.32; Giant, $1.91; Kelsey, $2.83; Hungarian, $2.05; Grand Duke, $2.29; Diamond, $2.11; Gros, $1.99. Peaches—Crawford, 90c; Susquehanna, 80c; Wheatland, 73c. Pears—Bartlett, $3.37; B. Hardy, $2.75. Grapes—Muscat, $3.17; Malaga, $2.04; Thompson Seedless, $1.36; Cornichon, $2.75; Tokay, $3.47. Peaches—Tuscan, $1.11; Elberta, 92c; Lovell, 69c.

Chicago: Pears—Bartlett, $2.47. Peaches—Elberta, $1.18; Crawford, $1.18; Lovell, $1.16; Tuscan, $1.03; Wheatland, 89c; Susquehanna, $1.30; Wiley Cling, $1.40. Grapes—Malaga, $1.83; Thompson Seedless, $1.38; Tokay, $2.85. Plums—Hungarian, $2.23; Italian, $1.53; Grand Duke, $2.12; Gros, $1.94; Giant, $1.82; Kelsey, $1.89; Diamond, $1.85; Satsuma, $1.32.

Total shipments, by cars, from August 17 to 22, inclusive: 227 peaches, 181 plums, 412 pears, 799 grapes, 65 mixed. Total shipments to date, 1918, 10,290 cars; total shipments to date, 1917, 9447 cars.

Special Livestock Market Report

San Francisco, August 28, 1918.

CATTLE—The cattle market is weak, especially on cow stuff, with which the market is heavily overstocked. Heavyweight steers, however, are still scarce and hold up much better than the lightweights. Last week's quotations hold.

Grass steers—
No. 1, weighing 1000 to 1200 lbs..11@11½c
No. 1, weighing 1200 to 1400 lbs..11@11½c
Second quality .....9@10½c
Thin .....7½@8½c

No. 1 .....7½@8c
Second quality .....6@7c
Common to thin.....3½@5½c
Bulls and stags—
Good 6c
Fair .....5@5½c
Thin .....4@4½c
Calves—
Lightweight 11c
Medium 10c
Heavy .....8@8½c

SHEEP—Sheep and lambs are firm. The supply is scarce and not of the best quality. Most of the stock reaching this market comes from northern points, Nevada and Arizona. The wool market is still a factor in holding supplies back. Quotations stand.

Lambs—
Yearlings .....12@12¾c
Milk .....12@14½c
Sheep—
Wethers .....11@11½c
Ewes .....8½@9½c

HOGS—A sharp advance in all grades of hogs is noted, and supplies are coming in more freely at the advance. Strong prices may be expected to rule for some time to come. Some California hogs are moving to the Portland market, where higher prices rule. One prime lot sold there for $20 per cwt.

Hogs—
Hard, grain-fed, 100@140.....7½@17¾c
do, do, 140@300 .....17¾@18c
do, do, 300@400.....17½@17¾c

Los Angeles, August 27, 1918.

CATTLE—The market situation here remains unchanged from a week ago.

Per cwt. f. o. b. Los Angeles—
Beef steers, 1000 to 1100 lbs.....$9.00@12.00
Prime cows and heifers..... 7.50@ 8.50
Good cows and heifers ..... 7.00@ 7.50
Canners, per cwt. ..... 5.00@ 5.50
Calves, per cwt. ..... 8.50@ 9.50

HOGS—There is a scarcity of choice, well finished hogs. Light hogs here were advanced. Receipts light and meet with ready sale.

Heavy, averaging 275@300 lbs..$15.50@16.50
Mixed, 225@275 lbs. ..... 16.00@17.00
Light, 175@220 lbs. ..... 16.50@18.00

Rough docked 20 pounds, piggy sows 40 pounds and stags 40 per cent.

SHEEP—Demand fair and killers had to reach out to get what they wanted. California, Arizona, Nevada, and Utah all contributing to the receipts the past week.

Per cwt. f. o. b. Los Angeles—
Prime wethers .....$9.00@10.00
Prime ewes ..... 8.50@ 9.50
Yearlings ..... 9.50@10.50
Lambs .....15.00@16.00

No. Portland, Ore., Aug. 26, 1918.

Twenty-two hundred head of cattle and 150 calves were counted in the cattle division over Sunday. Cow stuff is showing considerable strength, some weighing around 1000 pounds sold up to $9.80. The quality of cattle today runs heavy to fair and medium; however, the market is strong for all grades as quoted. Prime steers, $12.50@13.50; good to choice steers, $11.00@$12.00; medium to good steers, $9.75@11.00; fair to medium steers, $8.75@9.75; common to fair steers, $5.75@8.25; choice cows and heifers, $8.25@9.25; medium to good cows and heifers, $6.25@7.75; fair to medium cows and heifers, $5.25@6.25; canners, $3.00@5.00; bulls, $5.00@7.00; calves, $9.00@$12.00; stockers and feeders, $6.00@8.00.

The run of hogs over Sunday is 1300 head. The quality is generally good. The number of light unfinished hogs is comparatively light. The market is steady at quotations, as follows: Prime mixed, $19.50@20.00; medium mixed, $19.00@19.50; rough heavies, $17.50@18.50; pigs, $16.75@$18.00; bulk, $20.00.

The count in the sheep division over Sunday is 1200 head of sheep and lambs. There is little or no change in prices, all grades selling steady as quoted. Prime lambs, $14.00@15.00; fair to medium lambs, $11.00@13.00; yearlings, $10.00@11.75; wethers, $9.00@10.50; ewes, $7.00@9.00.

A WORD TO THE WISE.

Our good friend, H. A. Munger of Santa Paula, writes: "Enclosed find check for $5 to renew my subscription for five years. One year seems so short on a farm that it is no time until my subscription has expired; and to be without a good farm paper, and not able to keep in touch with the market prices and new ideas, is like trying to farm without tools."

Yes, the Rural Press is an absolute necessity nowadays. Farmers need help in overcoming the many new difficulties that are arising, and in our columns they find their troubles anticipated and their problems solved.

We are giving aviation quality, but at submarine prices. The various costs entering into the publishing of the paper have gone up tremendously, yet our subscription price has remained at rock bottom. How long it will continue at $1 we cannot tell. The white paper situation is acute; prices jump up over night. Consequently, we may have to increase the price to $1.50 any minute.

You intend to take the paper for years. You know how bothersome it is to renew for a year at a time. So why not settle the matter for several years, not only to be sure of receiving the paper but also to be sure of getting it for the whole term at the present price?

Right now we will accept renewals for from two to five years at the present low price of $1 per year. You cannot invest money to better advantage; the farther ahead you renew the more you make. Don't wait for your present subscription to expire. Send in your long-term renewal now. Better to be safe than sorry.

Don't miss next week's issue. It will be devoted largely to tractors on account of the third annual tractor demonstration at Los Angeles, September 17 to 21, and Mr. Hodges will answer those questions that have been coming up in your mind about the advisability of using mechanical power.

But the other departments will not be crowded out. Mr. Fox has been down in the peach and grape sections, getting first-hand information for you about these crops, and Mr. Whitten will tell you how to handle the sows and their litters this fall so as to get more and better pigs. It will be a fine issue.

MISCELLANEOUS.

REMANUFACTURED PIPE. All sizes standard pipe and wrought iron screw casing. All kinds of fittings. Guaranteed good as new. Write for prices. **Weissbaum Pipe Works,** 160 Eleventh street, San Francisco.

OWING TO THREE of my men leaving for the front, will not be at State Fair with potato exhibit during the week, but will meet any of my friends or customers on the grounds Monday or Tuesday, the opening days. H. A. Hyde, Watsonville, Cal.

CANADA—A Rancher's Life in Canada and Guide to Rural Industries. Fruit-growing, poultry-keeping, ducks, geese, turkeys, pigeons, hares, goats, bees, etc., 25c., postpaid. By C. H. Provan, Langley Fort, British Columbia.

TRACTORS FOR SALE—Two Moline tractors, new, at substantial reduction, with drawbar and two-point plow attachments each; under clearance 30 inches. Address A. B. Harris, 181 Vernon Terrace, Oakland.

SURFACE IRRIGATION PIPE for sale; 10-foot lengths, 20 gauge, 10 and 11-inch, new, at substantial reduction; have 4000 feet. Address Ramsey Probasco, 2436 Virginia street, Berkeley, California.

CO-OPERATION (not operated for profit) reduces living expenses. Particulars and catalogue from Co-operative League, Commercial street, San Francisco.

TO REDUCE THE HIGH COST OF LIVING, send for our Wholesaler to Consumer Catalog. Smiths Cash Store, 106 Clay street, San Francisco.

PATENTS THAT PROTECT are procured through Pacific Coast Patent Agency. Savings and Loan Building, Stockton, California. Established fifty years.

HAY FOR SALE—200 tons number one oat hay baled; sale to consumer at reduced rates. Address A. B. Harris, 181 Vernon Terrace, Oakland.

ALL SIZES OF PIPE and screw casing, both new and second-hand, dipped and undipped. Guaranteed. Prices right. Shecter Pipe Works, 304 Howard St., San Francisco.

$5.00 A DAY—Gathering evergreens, roots and herbs. Ginseng $14 lb. Belladonna seed $64 lb., or grow it yourself. Book and war prices free. Botanical 82, New Haven, Conn.

TRACTOR ENGINEER WANTS WORK—Four years experience on caterpillars, also wheel tractors. Does own repairing. C. J. Schack, Stacy, Cal.

FOR SALE—At a sacrifice, Beeman Garden tractor and implements. Good as new. P. Bouery, R. 3, Merced, Cal.

FOR SALE—A deep well pumping outfit, complete; 100 feet 7-inch discharge pipe. Box B, Menlo Park.

FOR SALE—Sandwich power hay press, 17x22 bale; practically new; $400 takes it. Ceres Hardware and Implement Co., Ceres, Cal.

COUNTRY LANDS.

FOR SALE—Forty-acre ranch, seven miles from Modesto, Stanislaus county, on main highway, paved to within one-fourth mile; 35½ acres fine alfalfa, 1½ to be planted this season; two acres mixed bearing orchard; one acre buildings and corrals; dairy barn for forty cows, separator room, etc., all complying with new dairy laws; house, barn for five horses, calf shed, etc., etc.; on main irrigation lateral; very near modern school; fine drinking water; one-third cash, balance long term, 7 per cent mortgage; deal with owner; no agents; will be glad to have friends show intending buyers the ranch. Write Carl G. Meiners, Meiners' Ranch, Ojai, Ventura county, Cal.

ALFALFA RANCH IN FRESNO COUNTY—50-acre alfalfa ranch, subirrigation, with substantial improvements, work stock and implements. Price, $20,000, $6,000 cash, balance long time. J. Hargeshimer, Sanger, Cal.

FOR SALE—Best cattle alfalfa ranch proposition in San Joaquin Valley. Half section, 220 acres, A1 stand of alfalfa, 25 acres corn. Abundance of electric pumped water, 300 tons alfalfa in stack. S. P. main line siding on ranch. State highway passes through ranch. Will give terms; deal direct with owner. J. S. Going, Quail Ranch, Pixley, Cal.

FOR SALE—20-acre irrigated ranch, with improvements and growing crop; team and farming implements; a bargain. William Paulsen, Chowchilla, Cal.

WANTED.

WANTED—A good married man for a stock farm; able to milk and do general farm work; wife to cook for two men; state experience, wages and reference to Thomas Harrison, Glen Ellen, Cal.

A Little "Tank"—for Farm Work

The Cleveland Tractor is built on the same principle as the wonderful European battle "tanks."

It travels on its own tracks, laying them down and picking them up as it goes along.

This efficient type of construction makes the Cleveland *specially* valuable to farmers, as it enables them to work practically *anywhere*—over almost *any kind* of farm land.

They are being operated over gullies, ruts and ditches, through soft soil, wet clay, sand and gumbo—without sinking or floundering. *They do not pack the soil.*

They are working under and among small trees, close up to fence corners, on hillsides and over rough ground with much better results than can be obtained with horses or with any other type of tractor.

And they are working much *faster*.

Thousands of Cleveland Tractors are helping to increase the production of food demanded by war conditions.

The Cleveland, pulling two 14 inch bottoms—which it will do under average conditions—plows 3½ miles an hour—eight to ten acres a day. This is equal to the work of *three* men and *three* good three-horse teams.

The Cleveland steers by the power of its own engine; it requires but slight effort on the part of the driver. Only one man is required to operate it. 12 horsepower is developed at the drawbar and 20 horsepower at the pulley. It is a constant source of tractive and stationary power for twelve months in the year.

It plows, harrows, plants, reaps, cuts ensilage, runs saws and pumps, drags logs, pulls road machinery, hauls manure spreaders and does practically all the work formerly done with horses or stationary engines.

The Cleveland Tractor produces food but consumes none of it. It conserves man power, horse power, time, energy, and effort—and produces greater returns.

The Cleveland Tractor was designed by Rollin H. White, the well-known engineer. It is manufactured under his supervision. Gears and tracks are protected from dust and dirt. Materials throughout are of the best. The whole machine weighs only about 3200 pounds. It can be housed in less space than is needed for a horse.

Take advantage of present produce prices. Raise *more* food *now*. Help the nation and incidentally make more money yourself by using one or more Cleveland Tractors.

Write for complete information and the name of the nearest Cleveland dealer.

The Latest in Tractors and Implements

Written for Pacific Rural Press by R. E. Hodges

MOTHER, with a heart bursting full of pride, was watching Johnny's regiment parade gaily up Market street. As Johnny's company passed, she exclaimed excitedly, "Look, father, there's Johnny. He's the only one in the company that's keeping step!" About four years ago, when California gave birth to an awkward baby called Tractor Demonstration, even the fond mother and the baby's godfathers themselves would scarce have been so proud of the infant nor so hopeful of his future as events have justified; for now, if you aren't in step with this lusty youngster, you are likely to find yourself behind in the parade and out of step with the progress of the times.

That baby in 1914 had a lot of things to learn. It was striking out somewhat like our baby kicks and waves his arms with great force but with little real knowledge of what its own strength would be or would become if properly directed. The tractor youngster kept kicking a couple of years without gaining a great deal of attention from the public, but his lustiness deserved recognition and he deserved a chance to perform on a public stage. In fact, it is his peculiarity that the more he performs in public the bigger he grows, and the more popular are his performances.

"Tractor Demonstration" has adopted a brother, who performs with him. They are really inseparable. Neither makes a good show by himself, but together their performances in the past two years have attracted crowds which have increased from 800 or 900 people per day to an attendance estimated at a great many thousand per day at the last one, held at Davis, and the one before that, held a year ago at Los Angeles. The adopted brother has proved as lusty as the first baby. His name is "Modern Farm Machinery."

The amazing growth of both in power and popularity has been due not alone to their inherent excellence and the extraordinary necessity for their services, but quite largely to the organization within the past two years of the Traction Engine and Implement Dealers' Association of Southern California and the California Tractor and Implement Association. Under their auspices each of seven or eight demonstrations has excelled the last one in magnitude and value and in value received by both exhibitors and visitors. The performance and exhibit which will be staged just out of Los Angeles on the Whittier boulevard, September 17 to 22, will be far more representative and of more value to visitors than even the mammoth demonstrations at Los Angeles last fall and at Davis last spring. The management proclaims that 150,000 visitors are expected. Three hundred and fifty acres have been secured for elbow room. Sixty acres of this have been assigned to tent exhibits, but since over 100 outside firms have applied for space the chances are that you will have to walk over more than 60 acres to see the machinery exhibits alone, besides the other greater area devoted to working tractors and implements. Over fifty different tractors will work side by side and simultaneously in the public plowing demonstration and many more will be working in individual demonstrations every day from 8 a. m. till the crowds disperse.

"Bearcat" tractor pulling 8-foot double disk in Southern California walnut grove.

Yuba 12-20 ball-tread tractor pulling four two-row bean planters on second speed.

Monarch "Neverslip" tractor pulling three-gang plow, with rolling coulters, turning up old pasture.

Keep Up to Date on Machinery.

In this year, when some of the nation's food in California has been lost for lack of labor, and when the use of many acres has been lost for the same reason, and when half of the crops on many other acres have been lost because operations could not be performed well enough or at the right time, it behooves every man to keep up to date on every kind of machinery that promises to help one man do more than one man's work. The labor situation is good this year compared with what it will be next year, so far as anybody can foresee. The tractor delivery situation cannot be expected to improve, but is likely to get worse. Every man who delays buying a tractor until he needs it for immediate use is

LESSONS OF LABOR DAY.

THE national holiday known as Labor Day was observed throughout the length and breadth of the country on Monday last, with unusual interest and enthusiasm. Processions in full bloom with flags and banners threaded the streets of all the larger towns; brass bands blared most stirring melodies; orators burst forth with burning tributes to industry—"and all the people said Amen." The observance of the day throughout was a most significant demonstration that the American people believes in work, honors workers and decrees that workers deserve and shall receive the reward of their labors for their own enjoyment and for their upbuilding to the standards of American citizenship and to the quality of American life. And all this is a lesson to the world, for this nation has already learned it well and credits the chief part of national progress and development to national recognition of debt to the laboring man and to the return to him of just reward and honor for his labor.

In this country the chief lesson of Labor Day is one which labor itself must learn and that is that honors and rewards in a republic impose upon those who receive them an obligation which they should sincerely assume and loyally discharge—even at the cost of sacrifice. Of course, this is not more the duty of labor than of other factors in the development of true democracy, but is the same duty which rests upon all who labor with heads, hands, purses or only with their tongues. All must learn that the obligation rests upon everyone to bring his job through to its completion and not to forsake his job, if it is worth doing, and he remains in possession of his capacity for work, and his employer lives up to his obligation as understood when the job was entered upon. Petition and protest are, of course, the right of a man and no decent employer will refuse to fairly consider and adjudicate them, but to throw down a job because the employer is in a pinch and can be unfairly squeezed is equivalent to desertion from an army or to slacking in a public obligation for completion of service.

HOW A LESSON IS ENFORCED.

THIS seems to be the most significant lesson of Labor Day and the fact that the public honors the day and adequately interprets its significance should convince those who enroll themselves under the banners of Labor that it is their duty to requite the public for its honor and confidence—just as others feel themselves patriotically impelled to do. Let us put the matter more concretely in the words of those who stand high in public service and in the nation's respect—words which were spoken to Labor on Labor Day. An announcement on the part of the War Department is this:

The Government will brook no profiteering by labor. It is ready for a fight if labor insists on having a fight. It declares President Gompers and the other American Federation of Labor leaders have done all within their power to have organized labor support the Government. But some of the local leaders have not the same patriotism. Meantime, department heads have been framing methods of handling labor in the new draft. Exemptions will be granted to skilled workers engaged on war contracts. And "industrial furloughs" will be in effect to help fill up certain lines of labor. That means that a man inducted into the military service may be furloughed to go back to industry. If he strikes he must go back to the army. Where labor is free from the responsibilities and dangers of fighting service, it shall keep at its work. If it has grievances, it can submit them to the Federal War Labor Board for adjustment.

Ex-President Theodore Roosevelt, in his address at a launching at an Eastern shipyard, said this:

I am convinced that, generally speaking, there is a fine spirit of patriotism in shipbuilding labor in all parts of the country. Yet it has been alleged that in certain yards unions have actually limited the output so as to limit the number of rivets driven in a day, or the number of days that men work, or in other ways to prevent the development of our utmost speed. Such men are traitors to the country. If I had my way, I would take any such men and any men who aided or abetted them, put them in the army at once, and send them across the water to do the hardest work in the most dangerous position, and I would not give them rifles until they had learned the spirit of patriotism.

And Secretary Daniels, speaking of the conditions to follow the return of peace, said this:

The people will take on new dignity. New conditions will impose new duties. Statesmanship of vision of will create new opportunities for American commerce and guarantee to labor the bread it has earned. This war is fundamental. Its effect will be to change everything. Trade and commerce and finance will seek new and broader fields and men and standards. There will be a more equitable division between capital and labor. But no Bolshevikism, no failure to protect alike property and labor, no class domination that lends itself to injustice or wrong can flourish on this continent.

These are the lessons of Labor Day which are of utmost importance to this country and to the world. Every citizen should patriotically ponder them and every alien should obey them or be interned. For what are we sacrificing life and treasure if it is not for a better world and how can we populate and preserve a better world unless we have better men?

IS THE STATE FOR CROPS OR GAME?

WE SHARE Secretary Daniels' confidence that there is a better world coming and we shall expect to find in it a better relation of crop growers to the protection and preservation of their crops. For a long time the chance of getting a crop has been determined by a combination of nature-lovers and nature-killers known as sportsmen. We have no objection to either and no hard words for either if it will ever be content to enjoy its love and its licensed murder without practicing its emotions and arts at the expense of those who are trying to produce the food which will win the war. This is the present aspect, though it is a very old question. Before the war nature-lovers and sportsmen placed all the farmers under subjection by forcing them to allow their fields to go unprotected from wild marauders: constituting farm property a State-wide game preserve—thus transforming a country which claimed to protect any man in the enjoyment of his property into a class hunting ground of the most ancient European type. We have always claimed that such treatment of farm property was kaiserliches and wrong. We have always urged that if science and sport needed wild things they should provide for them in state or national preserves and not turn the whole countryside into a "zoo" and a shooting range and oblige the farmers to feed their pets and targets—and to keep the shooting range stocked with their own farm animals for shooting when wild game was scarce or when fool hunters could not tell a farmer or his calf from a grizzly!

A HUN-LIKE MENACE.

THIS old question is now becoming intense and aggravated because it is impossible to grow rice and wild ducks on the same land and get anything but ducks which cannot be killed and sold when the crop is ripe because of the game laws. Naturally the rice growers are excited and are making strenuous efforts to determine whether they have any rights which anybody is bound to respect. They lost a million dollars last year feeding ducks so sportsmen could shoot them some weeks later, and they are in it to lose more this year unless they themselves have some rights in relation to the ducks which are feeding on a greatly increased acreage of rice. Though they have been appealing for weeks to all the governmental gods at once, they do not yet seem to have gained anything but threats and insults. At a meeting held at Willows on September 2 they decided to go over the head of the California Fish and Game Commission and to appeal directly to the State Food Administration, and then to the Department of Agriculture at Washington, to secure immediately relief from loss to their rice crops due to the depredations of ducks. This relief can be had by opening the shooting season for ducks earlier instead of waiting until October 15, by which time the rice will be largely eaten up by the vastly increased duck census.

It was shown by Assemblyman Poisely of Red Bluff at the Willows meeting that if the rice growers did not cease their effort for this earlier opening of the shooting season a member of the Fish and Game Commission has threatened to change the trespass laws to prevent the farmers protecting themselves from hunters. This is a fine Hun-like proceeding on the part of the authorities surely: if the farmers try to protect themselves from the ducks, the authorities will allow the pot hunters to swarm over the rice fields and destroy the crop that way. Relief should be immediately granted and farmers should be allowed to kill ducks before the crop is destroyed and to sell them to pay the cost of crop protection. Secretary Daniels believes the world will be better after the war. We hope this corner of it will be better after this duck war is over, for we believe the coming Legislature will not allow our agricultural areas to longer remain an ornithological museum and a sporting emporium.

MORE LIGHT ON MARKETING.

THE PUBLIC conscience is being quickened and the public head illumined on the subject of fair marketing in ways which were inconceivable before the war dropped its depth bomb into the murky caverns of common commerce. The illumination of the great gulf which lies between producers' receipts and consumers' payments continues to flash new light into the public mind. The Bulletin, to whose incisive action we gave much attention in our last issue, is continuing its crusade against the petty profiteers who burglarize the back gates and area entrances of our city homes, and is winning much favor not only from victimized consumers but from retail dealers who wish to trade on the square. How many quick conversions there may be from back alley bandits to boulevard square-dealers we do not know—and it does not much matter perhaps, providing conversion is really turning from evil ways. There does not seem to be such a thing as tainted money in trading: commercial ethics recognize both large profits from small sales and small profits from large sales as commendable, and it is all right to repent and turn from the one—if you can do it smoothly and quickly enough to get the other. However, we leave all that to the Bulletin: the ethics of retailing are not in our repertory.

Another matter is cropping out of the agitation of municipal retailing which is very much in our line, and that is doing private business with consignments which are entrusted to commission houses to be sold for the benefit of consignors—a line of business in which the commission merchant accepts a trust as the honorable agent of the producer and loots his property by selling it to himself as a jobber for retailers. We do not know how much of this is being done or who is doing it, but there has always been a conviction that it has been a considerable phase of urban robbery of farmers and efforts have been made at many Legislatures to enact a law which would make it possible for a shipper to know whether his produce was really sold by his commission merchant as an agent or whether the merchant sold it to himself at his own price and then re-sold it on his own account at some other price. Legislators have always been convinced by someone that efforts to give shippers such information were impracticable.

A HINT FROM THE FOOD ADMINISTRATION.

POSSIBLY the next Legislature will not find it so impracticable as its predecessors have done, because the U. S. Food Administration has all commission merchants under its license and is reading them the riot act as to how they must behave. The following is extracted from the Food Administrator's rules:

Licensees act in either one or the other of two capacities. They are agents who sell for the shipper on commission or they are actual purchasers for their own account. Some of them are engaged in both lines of business, and the shipper is often at a loss to know whether the receiver has bought the goods for his own trade or sold them to someone else. In such a case there is the possibility that the price realized would not be so high as when sold on a competitive market.

The Food Administration now requires a receiver to give detailed information to the shipper regarding the disposal of his consignment so that he may judge whether or not he has received the best treatment possible. When he buys the goods outright he must not use any expression in reporting to the consignor that would tend to give the impression that the sale had been a commission transaction. The expression "net return basis" is not to be used in connection with purchases. It can be used only in reference to an agency transaction.

In this regulation of the Food Administration we have the basis upon which to proceed to get the information which the consignor must have. The coming Legislature should see to it that such regulation of the commission trade as is now enforced by the Food Administration shall not lapse with the close of the war!

QUERIES AND REPLIES

By the Editor.

Inquirer Must Give Full Name and Address.

Half-Baked Americans.

To the Editor: I have just read your so-called editorials in your issue of August 24 and would like to ask you where you get the "half-baked" stuff? Has it come to such a pass that people can't go back home or to hell if they want to without having some hop-head calling them "half-baked"?—H. D. Gerken, Modesto.

A man has no right to fit himself to go to hell because he cannot do that without outraging his moral and religious nature and without doing wrong also in his relation to his fellowman. To fit himself for hell a man must unfit himself to live upon the earth, and of course no man has any right to do that. As for the right of "half-baked Americans" to go to their old homes we do not question that—unless they do something which necessitates internment. On the other hand, it is our notion that any alien who does not appreciate the advantages which this country has given him should "go back home" as soon as he can. If he has no deep and sincere longing to become a full-baked American, he should never have been admitted to this country—except as a traveler. We have thousands of foreign-born citizens and millions who are only one generation from foreign birth, and both of these classes are as good Americans as there are, but the dough-faces who are in this country merely to imperil the principles and practices which make it great while enjoying the same privileges and opportunities which the country affords to those who really love it and support it—such persons should be allowed to "go back home" as soon as it can be safely permitted.

A Grand Old Cherry.

To the Editor: I have a cherry tree that is 103 inches in circumference and the limbs measure 24 feet. Some of the ends are dead. Do you think I had better prune it back after cutting off the dead ends? The cherries are black. The ground is sandy loam and no hardpan. I irrigate it after picking the crop.—J. H. G., Lakeport.

You are fortunate in having one of the grand old cherry trees which survive from pioneer plantings in different parts of the State. They have an outlook for much longer life when they are on good deep soil and are not allowed to suffer for lack of moisture. On a deep light soil they are apt to lack soil moisture late in the summer and even large old trees may die outright if the lower soil gets too dry through lack of retentiveness—especially, of course, in years of scant rainfall. You have done the best thing possible for the tree by your irrigation after fruit-picking. Keep that up and you will have less die-back in the future. An old cherry is revivified by pruning. Cut below die-back to good, lively wood. Remove branches which seem weak and failing for lack of sap flow. We should not cut back simply for the sake of doing it, but always to get rid of weakness or defects. Keep the good sound wood with good spurs and the old chap will give you large crops for another generation or more, if the trunk is free from sunburn and decay. Unless the land has been recently manured, give the tree a good underspread from a few feet away from the trunk outward beyond the overhang of the branches.

Caterpillars on Oaks.

To the Editor: Can you help us rid this town of the tent caterpillar? This year we suffered more than in previous years. The holly oak trees were wrapped with masses of the pest and almost denuded of leaves. We are inflicted with the small green caterpillar on these trees also, but the tent caterpillar is in far greater numbers and does much more damage. We have been told that there is a green beetle which is the enemy of the worm, but we do not know the details, etc.—Reader, Belvedere.

The defoliation of oaks by both the caterpillars you mention has been in fitful progress ever since creation, perhaps, because the insects are native Californians, just as the trees are. There is, therefore, no danger that the worms will kill the oaks. They have always been saved from destruction because the invading insects have their own enemies, which reduce them when they multiply too greatly. But while these friendly allies of the oak lovers are catching up, the enemies of the oaks destroy their beauty and weaken them, no doubt. During the last twenty years the oak lovers have been making a counter-attack by spraying and have reduced the distress of the trees very much. The treatment consists in thoroughly spraying the foliage with lead arsenate, which is a simple process but requires power-spraying outfits to be used from scaffolding mounted on wagons, so as to reach the tops of the trees and to move easily from one to another, and the spraying requires much labor. Of course, orchard-spraying outfits are serviceable if rigged for use on trees of the height and spread of an oak.

The "green beetle" to which you refer may be one now on trial by State Horticultural Commissioner Hecke. We are not aware that its serviceability has yet been reported upon.

Stocks for Peaches and Apricots.

To the Editor: In choosing the stocks for peach trees wouldn't either the almond or apricot be better on account of the peach stock being short lived? For light soil, which is the better stock for the apricot and why? What variety of peaches do the nurserymen use as stocks for peach trees? How may the seeds be kept from harvesting time to planting?—H. M., Caruthers.

The peach root in California cannot be said to be short-lived in a free soil carrying adequate and regular moisture. There are peach trees planted in the '50s which are still thrifty. The peach tree generally goes to pieces in the top, not in the root. Still, the almond and apricot may have greater longevity. For a fine, light, deep soil, adequately moist by rainfall or irrigation, the peach is well suited for the peach, the almond and the apricot. For a coarse, deep soil, liable to become somewhat dry, the almond is best for the almond and for the peach, but not for the apricot, because the union is apt to give way even when the trees are of considerable size. The apricot root is good for the peach and the apricot on soils more retentive but not liable to long saturation. Peach seedlings grown from thrifty, strong-growing yellow peach varieties, both frees and clings, are preferred, but all our commercial varieties are largely used. Pits may be sandwiched with sand to advantage, but pits dried sufficiently to prevent molding and stored in sacks or barrels in a dry, cool place are largely used.

Gummosis in Fruit Trees.

To the Editor: Kindly give information on the treatment of gummosis. I have quite a number of almond trees, planted this year, affected with the disease, if it is a disease.—A. B., Paso Robles.

Gummosis of fruit trees is not a disease but is a symptom of disorder and derangement. In some cases it has been shown to have as a direct cause a parasitic organism and is an indication of its aggressive work and is subject to cure by the use of Bordeaux mixture of bluestone and lime, which kills the causative organism. In most cases, however, it is a dried exudation of sap extravasated because of some interference with normal sap supply and movement. This may be local, at or near the place where the gum appears, and may be a resultant of injury to the tissue by sunburning, by the work of an insect or some other mechanical cause. In such cases the gum and adjacent dead bark should be removed and the wound treated with Bordeaux mixture to kill decay germs which may approach. In very many cases, however, gumming is an indication of injury to the whole circulatory system of the tree by root trouble caused by destructive substances in the soil, or by root-rotting caused by standing water or by root-atrophy caused by excessive drouth or excessive soil temperature. In these cases correction of soil conditions must be undertaken. Gumming of the almond is generally due to sunburn or to borers or to irregularity in soil moisture.

WORK THAT PAYS

The war has depleted our field staff to such an extent that we need a few red-blooded men to attend to our renewals and secure new subscribers. It is real, necessary, war-time work, for we are helping Uncle Sam to increase food production by showing our readers how to raise more and better crops.

We can use elderly men, and lack of experience is no barrier. No investment necessary, except that you must have an automobile. Straight salary; permanent work, with advancement.

Write for full particulars and tell us a little about yourself. You will be glad you investigated

What Alfalfa Does in Rotation.

To the Editor: I read what you said in the Rural Press of August 3 about plowing under alfalfa fields which had become weary. I had nine acres of alfalfa which was not very good, so I plowed it under in the spring of 1917 and planted corn for silage, getting a good crop. Last November I put it into barley and got 369 sacks (about 110 or 112 pounds to the sack). On July 2 last I irrigated and planted Lady Washington beans and now have a fine stand—a little better than 28 sacks to the acre.—N. H., Hughson.

Your experience is a demonstration of the value of alfalfa in rotation, and the fact that one should not be content to keep on a poor stand of it too long, for, like some poor men perhaps, it can serve the community better under ground. Of course, your experience shows that you have good land, for good land is not only suited to grow good alfalfa but to benefit most by the turning under of the wreckage of it.

Bean Rust.

To the Editor: I send a leaf which I find in my field of Bluepods today. There are a number of plants with leaves like that I send and it seems to be spreading. It looks like bean rust, but no one here seems to know just what it is or what to do with it.—A. M. J., Lompoc.

It is bean rust (uromyces appendicu latus), but it is not yet in sufficient amount to seriously reduce leaf action and, appearing so late, is not likely to spread sufficiently to interfere with the crop. This is the way it usually acts in this State.

Sunburned Figs.

To the Editor: Our Adriatic figs are sunburned; there are a lot of black wasps and web on the trees. Are they the cause and how can I control it?—H. M., Caruthers.

We cannot see what the wasps have to do with it: they are probably after the spiders which make the webs, for the wasp family is about the only one which has an appetite for spiders. The only discoloration of figs we know of is due to souring or to lying too long on the hot ground before gathering for the trays.

California Weather Record

The following rainfall and temperature record is furnished the Pacific Rural Press by the United States Department of Agriculture Weather Bureau at San Francisco for the week ending at 5 p. m., September 3, 1918:

Stations—	Rainfall Data: Past Week	Seasonal To Date	Normal To Date	Temperature Data: Max'm	Min'm
Eureka	...	.43	.24	76	48
Red Bluff	...	.12	.05	110	66
Sacramento	...	...	.01	104	54
San Francisco	...	...	.01	76	54
San Jose	...	...	.05	96	54
Fresno	...	...	...	106	64
San Luis Obispo	...	.01	.05	92	56
Los Angeles	...	.11	...	86	62
San Diego	...	.04	...	78	66

The Brood Sow Pleads for a Square Deal

Overheard in the Hog Field and written for Pacific Rural Press by R. H. Whitten

I WONDER if the boss has forgotten that I am due to farrow in a couple of weeks. I don't believe he keeps any record of farrowing dates. He seems to think that he can tell from a sow's appearance about when she will farrow, but he gets fooled lots of times.

For instance, there's Orion King A Wonder Grand Leader's Princess over in the next pen. She's looked like a balloon for weeks, and the boss has been feeding her dandy chow, although she isn't due to farrow until long after my time. But poor me—just because I don't look so heavy with pig and don't develop my udder until the last thing before I farrow, why I get nothing but alfalfa pasture right up until farrowing time, and the result is that my pigs are not so strong at birth and I am not in good enough condition to nurse them properly.

The boss doesn't seem able to get it through his bean that a pig well born is half raised; that the larger and more vigorous it is at birth the more rapid its development will be and the cheaper it will put on its gains; and that even if he believes in carrying his brood sows through most of the gestation period on alfalfa alone, it will pay him to give us some grain during the last six weeks in order to furnish sufficient nourishment for the rapidly developing pigs and to build up a reserve which can be drawn upon in nursing our litters.

This isn't extravagance. It's right in line with the present policy of conservation. If the boss would only post himself a little, he would find that of all young pigs that die 40 per cent are lost before they are 12 hours old, many coming dead or so weak that they cannot nurse, and many more killed by thin sows that are so restless that they jump up every few minutes for something to eat.

GOOD CARE REDUCES MORTALITY.

Somebody said that a season's crop of pigs could be increased 15 per cent without increasing the number of brood sows. I believe it, for I know I could give my boss fully 15 per cent more pigs at weaning time if he would only put me in better condition for farrowing, help me at farrowing time, and give me and my pigs better care during their babyhood. So he ought to keep a record to tell him when to begin to feed me for the benefit of my unborn pigs, and when to put me in a pen to get me in shape for farrowing.

I guess he means all right, but generally he forgets to free me from lice before putting me in a pen. Of course, I'm too heavy to dip at such a time, but he ought to spray me thoroughly with some good disinfectant.

And he ought to spray the pens, too. Whew, how they generally smell! I guess he never cleans them out. There are layers upon layers of filthy accumulation, making a great breeding ground for disease germs. And still he expects me to raise healthy pigs. I wonder if he makes his wife raise her children in such quarters.

How I would welcome a little attention while penned up! When I am farrowing the boss expects to be in the pen with me, yet before I farrow he doesn't do anything to make me confident that he will not hurt me or my pigs. If he'd only scratch my back and rub my udder a little, I'd soon lose my wildness and crossness, and I'd welcome him with a satisfied grunt instead of a growl.

How thirsty I get while I am kept in that pen! Just before farrowing I seem to want more water than ever, as it helps to keep my fever down. If the boss would only keep water before me all the while, I could help myself to it when I want it. I seem to crave minerals, too, and wish he would keep tonic before me. And when there isn't enough skim milk to go around he ought to give me a little tankage, as it will help to overcome any tendency to pig eating.

SIGNS OF FARROWING.

The boss watches for us to make a nest, but a more reliable way to tell when we are going to farrow is to watch our udders. When a colorless liquid appears we generally will farrow within 24 hours, and when the udder becomes feverish and the liquid turns milky white our pigs may be expected within 12 hours.

I wish the boss wouldn't feed me so heavily just before I farrow. Of course, I'm true to my name and I eat all he sets before me, but if he would feed me very lightly for 48 hours before farrowing it would prevent a surplus of milk from being forced into my udder. The udder wouldn't be so liable to cake, nor the pigs to have scours. The grain should be fed me in the form of a thin slop, and the ingredients should be regulated so that I will be kept free from constipation. Bran is laxative; so is oil meal. If these are not effective, two or three tablespoons of Epsom salts should be added to my slop.

BE ON HAND WHEN THE PIGS COME.

The old man kicks because we sows kill so many sows at farrowing time, but he does very little to help us save more pigs. Of course, he has a guard rail around the farrowing pen, but until a pig is 48 hours old it doesn't have enough sense to beat it for the rail when it sees its mother move around, and that 40 per cent "infant mortality" record could be reduced a whole lot if the boss would only stick around awhile and look after our pigs, at least until we finish farrowing.

As each pig comes he should take it away from the sow, wipe it dry, and remove the mucus from the nose to allow easy breathing. The pigs should be put in a clean box with bedding in the bottom, and it should be warmed with bricks or a jugful of hot water if the weather is cold.

Strong, husky pigs like these can be raised only when the best of feed and care is given.

Before the pigs are put back with their mother they should be ear-notched, as a cut made at this time will not bleed. Also, those long, sharp tusks should be removed. I don't see why in Sam Hill they were ever given to new-born pigs. They start canker sore mouth, cause injuries when pigs are fighting, and hurt us sows so much when the pigs are nursing that we sometimes roll over on our bellies and won't let them nurse at all.

If the boss is on to his job, he will keep all pigs away from a sow until she is through farrowing, unless she requires more than two hours and the pigs get very hungry. In such a case he will take two at a time, hold them and let them nurse until satisfied; then put them back and get two more.

When the afterbirth has been removed and the bedding freshened, he will put all pigs with the sow and superintend the allotting of positions to see that each pig gets a fair chance. He will be on hand the first time the sow gets up, and if she is very uneasy he will remove the pigs until she is quieted down again. He will stick pretty close to the farrowing pen for the first 48 hours, until the pigs become more wide-awake and learn to run under the guard rail. After that they will keep out of the sow's way and will have little trouble.

FEED THE SOW SPARINGLY.

Generally the boss is pretty hard hearted, but he weakens in one case where he ought not to. He gives us slop soon after we finish farrowing, while we should not have anything but fresh water for 24 hours. And even then we should get only a small amount of a thin slop, because it is necessary to retard the flow of milk and prevent it from being too rich until the pigs are old and strong enough to take it all.

The first day two pounds of whatever mill feed is being used, and six pounds of skim milk, is plenty. Then each day the grain should be increased a little, with the proportionate increase of skim milk, allowing ten days to bring a sow to full feed, which will require about 12 pounds of mill feed per day. If skim milk is not used, tankage should be substituted, and should be used in the proportion of one part to ten of the grain mixture.

The amount stated for a full feed is only approximate. We should be given enough so that our pigs will have all the milk they want, yet none will be left in our udders. If our pigs nurse well and then lie quietly and sleep, it's a pretty safe bet that they are just getting enough. But if they keep tugging away and squealing, and their hair stands up, we need more milk-forming food.

EXERCISE NECESSARY.

Somebody ought to beat the whey out of the boss for keeping us cooped up the way he does. Sows need exercise just as much as food, and if we are to be kept for several days in a central farrowing house we should be given exercise daily. Yet he never thinks of taking us out of our pens until he moves us out into the fields.

Fortunately, he doesn't like to clean our pens, so he gets us out on alfalfa as soon as possible. How the pigs do enjoy romping about! And how much better they thrive! The exercise makes them eat more, and you can almost see them grow.

Pretty soon—when they are two or three weeks old—they begin to eat with us at the trough, and at this time they should have a separate trough inside a creep so that they will get plenty. We old sows eat so much faster than they do and are so greedy that they do not get enough unless they are fed separately. It's all right to give them the same slop that we receive, but if you are feeding ground barley be sure that it is finely ground, as otherwise the sharp, coarse hulls are apt to cause trouble. Keep the troughs clean and do not let the slop sour.

If possible we should be put in a field where there is green alfalfa. Our young pigs will begin to eat it when three or four weeks old, and nothing is better for their development. But they won't eat the stemmy growth, and should have an abundance of green, tender shoots.

Sanitary quarters, good food, close attention, kind treatment—members of my race never fail to respond to these things. And I'll bet a good big bucketful of rich slop that if my old boss would pay more attention to such things his profits would be just about doubled.

TO SUCCEED WITH SHEEP.

Never keep them on low, marshy land.

Have good fences. If they are not dog-proof, keep the sheep in a corral at night.

Keep fresh water and salt before the sheep at all times.

Avoid internal parasites, such as stomach worms, by changing pastures frequently.

Be on the lookout for maggots in hot weather and fly time.

Don't allow the ram to run with the flock after all of the ewes are bred.

Be careful about driving pregnant ewes through narrow gates or doorways. A very slight injury may cause them to abort.

Tractor Demonstration Location Changed

[Written for Pacific Rural Press.]

On account of the list of entrants for the Third Annual Tractor Demonstration being far in excess of all previous calculations, and the demand for hundreds of additional acres of demonstration land growing greater each approaching day of the meet, the big tract of land selected for the site on Whittier boulevard has been abandoned for larger acreage on Wilshire boulevard at La Brea avenue, at the western city limits of Los Angeles. The Whittier boulevard site would have been ample for a demonstration of a size similar to last year's meet, but the officials in selecting that location never dreamed of having to accommodate so many exhibitors as have already signed up. Entries have been so heavy during the past week that every estimate on construction and other necessary work has had to be practically doubled.

THE NEW LOCATION HAS MANY ADVANTAGES

over the original one. It is several hundred acres larger and no matter how many exhibitors enter there will be ample room for all. At the old location only 350 acres were available for a demonstration field, with 60 acres for exhibitors' tents. At the new location spectators can more easily witness the demonstration of the scores of models and the operators of the many machines will not feel crowded.

The Wilshire tract is more easily accessible from points in Los Angeles and surrounding country, being connected with the boulevard running direct to the heart of Los Angeles, with smooth paving all the way. The Santa Monica red car line via Sherman, leaving the Hill street station of the Pacific Electric, runs past the tract and special car service will be had during the five days of the demonstration.

It is the desire of the general committee of the Traction Engine and Implement Dealers' Association of Southern California that everybody tell his neighbors and friends about the change in location, so that there will be no misunderstanding and all visitors will go direct to the Wilshire boulevard site.

REMEMBER THE NEW LOCATION.

It's right at the western city limits of Los Angeles, on Wilshire boulevard, the main artery of travel to the beaches. The new site makes it possible for several score additional entrants to be accommodated and visitors will be able to enjoy a bigger, vaster array and demonstration of tractors, tractor implements, farm machinery and ranch necessities.

The demonstration starts Tuesday at 8 a. m. and runs every day, September 17, 18, 19, 20 and 21, closing at 5 p. m. on the final date. No admission will be charged and there will be parking space for over 10,000 automobiles free. A restaurant on the grounds will serve dinner at attractive prices.

Free Lectures by Tractor Experts

[Written for Pacific Rural Press.]

Particular emphasis is being laid on the importance of proper care and upkeep of tractors. The initial cost of a tractor occupies the mind of the tractor buyer usually more than anything else—until after he has used his newly purchased machine for awhile and begins to give consideration to the operating expense and cost of upkeep. The necessity of the steel steed is recognized by every up-to-date food grower as the most important factor in forcing food production to the highest pitch. Any effort in securing greater efficiency from a tractor naturally results in more intensified work in helping lick the kaiser on the American farm and ranch.

In bringing about this increased efficiency every tractor buyer or prospective buyer is interested in practical tractor instruction. Over a year ago the National Automotive School, claimed to be the largest and oldest mechanical and technical trade school in the West, inaugurated a course in tractioneering and scores of trained men have graduated, having greatly profited by the thorough instruction received.

Realizing that thousands of tractor owners and prospective operators will attend the big Third Annual Tractor Demonstration, September 17-21, the school has decided to do some very commendable work. It has arranged a course of free lectures, two to be given each day during the meet. These lectures will be worth a good many dollars to any man interested in tractors. They will be one hour long, one to be given in the forenoon and one in the afternoon, and will be scheduled so as not to interfere with the regular demonstrations. Various instructors headed, by M. G. Coles, chief instructor, will lecture on various phases of tractioneering, and the talks will not be dry and deeply technical but rather will be practical and instructive, so that anyone can understand. There will be demonstration models of various parts of tractors, so that the lecturers can actually demonstrate their talks.

SCHEDULE OF LECTURES.

September 17.

Morning—Principle of the 4-stroke gas engine. Single, twin and 4-cylinder types Cylinder design and cooling methods.
Afternoon—Tractor ignition.

September 18.

Morning—Carbureters and mixers. Handling heavy fuels.
Afternoon—Magnetos.

September 19.

Morning—Bearings and lubrication. Oils and greases.
Afternoon—How to avoid ignition trouble.

September 20.

Morning—Breaking in a new tractor.
Afternoon—Repairing magnetos without the help of a service man.

September 21.

Morning—How to succeed with tractor farming.
Seating arrangements have been made to accommodate a large audience.

Visalia Tractor Course

The man that's not drafted has to feed the man that is. A tractor helps on the farm job and drivers are scarce. The drafted tractor driver has better work in the army than a private and has more pay, better conditions, and higher rank. San Joaquin men have an opportunity to go far toward qualifying for tractor drivers by working at the "Emergency Tractor Short Course" at Visalia, September 23 to 28, to be taught by University instructors and by factory men who will accompany the nine or ten different tractors, each of which is to be driven by every student. Plenty of land is available at the high school grounds for the practice work. Every day of the course will be full of lectures and work. These include fuels, carburetion, ignition, magnetos, governors, lubrication, valve timing and grinding, adjustments, repairs, implements to be used with tractors, belt lacing, babbitt pouring, pipe-fitting, etc. The course will be practically the same as those held at Davis and Riverside. It is promoted by Farm Adviser C. M. Conner, Visalia High School Agricultural Director R. J. Baker, and a committee of tractor owners. Tractors used will be Bean, Samson, Best, Moline, Holt, Case, I. H. C., Wallis, Fordson, and probably Cleveland. Students will pay a registration fee of $2 to cover expenses, but the general public is invited to the evening lectures on "Tillage Methods and the Best Tools to Tie to a Tractor." Detailed program will be sent on request addressed to Mr. Conner or Mr. Baker at Visalia.

LOCATION CHANGED

Mammoth Tractor Demonstration

¶ Owing to the absolute necessity for several hundred additional acres of land to accommodate late entries, the location of the 3rd Annual Tractor Demonstration has been changed from Whittier Boulevard to

WILSHIRE BOULEVARD

Corner La Brea Avenue
at western city limits of Los Angeles

GATES OPEN TUESDAY, SEPT. 17, 8 A.M.

Third Annual Tractor Demonstration

September 17, 18, 19, 20, 21

NO ADMISSION FREE AUTO PARKING

¶ Tell all your friends about the new, better location. Easily accessible by Santa Monica red line running from Hill Street Station, Los Angeles, and motor boulevards.

Traction Engine & Implement Dealers' Association
of Southern California
220 H. W. Hellman Building LOS ANGELES

The FAMOUS HARDIE JUNIOR SPRAYER

We believe this is the greatest small power sprayer ever manufactured. And placed on the market with phenomenal success in every fruit section in the United States, and vouched for by thousands who own the FAMOUS HARDIE JUNIOR. Equipped with 1½ h. p. engine, battery ignition, 150-gallon tank with mechanical agitator, capacity of 4 gallons per minute with a steady working pressure of 200 pounds, and two 25-ft. of the best spray hose, fitted with spray rods and nozzles; 4-inch tire truck with pole or shaft.

ALL FOR $275.00, DELIVERED ANYWHERE IN THIS STATE.

If truck is not needed, deduct $45.00.

These prices are subject to change without notice. The wise buyer will place his order now for future delivery.

This low price is made possible by big production.

If you are interested in other types and sizes of the HARDIE POWER SPRAYER, write us for the big spray catalog, and learn why we can offer more spray pump value than any other spray pump manufacturer. Hardie Spray Hose is the Safest Hose to Buy.

The Hardie Manufacturing Co.
200 N. Los Angeles St. LOS ANGELES, CAL.

FOR HARVESTING
EGYPTIAN CORN

You can use both hands and cut twice as much in a day with the

DAVID HEADING KNIFE

as with any other instrument. You cut off the stalk and hold the head with the same hand—and you keep both hands at work, cutting as fast as you can open and shut your fingers. Pair (right and left) $2.50, from your dealer. *Dealer; order from any jobber.*

David Mfg. Co., Dept. C San Jose, Cal.

FACTS ABOUT THE TRACTOR DEMONSTRATION.

Third annual event.
Over 100 firms taking part.
Over 50 types and makes of tractors.
Hundreds of farm implements and machines.
Exhibition tents cover 60 acres.
Demonstration field covers 350 acres.
Estimated attendance, 150,000.
Location — Whittier boulevard, half mile east of city limits.
Duration—Five full days, September 17-21.
Gates open at 8 a. m.
Gates close at 5 p. m.
Estimated valuation—$1,000,000.00.

ALFALFA GROWERS ORGANIZE FOR CO-OPERATION.

[Written for Pacific Rural Press by J. C. Johnson, Fresno.]

The Alfalfa Growers of California Inc., the farmer's co-operative organization, which is designed to banish the hay profiteer and encourage the greatest development of California's great alfalfa industry, is now on a working basis. At a recent meeting in Fresno the 25 organizers, who have been working under the supervision of State Market Director Harris M. Weinstock, decided to incorporate the big project and commence active work in the interest of the alfalfa industry.

The association hopes to market its first hay by December 1. The state is now divided into seven districts and solicitors are working with the aim of reaching a goal of 60,000 acres by December 1. The organization is now represented with 25,000 acres stretching over California, from Tehama county to the Imperial Valley.

One of the greatest forms of helpfulness will be the jobbing feature of the association. It is hoped to effect a great saving for the membership through the purchase of tractors and other farm implements for the alfalfa grower in lots.

Taking as a nucleus the California Alfalfa Growers' Association, the State Market Director has enlisted members of the industry in one of the most powerful forces for the betterment of the farmers and California. The grower receives multifold returns for his small investment. At the time of signing up the grower pays 50 cents cash, or half in cash and half in sixty-day note for each acre of alfalfa cultivated by or for him prior to signing up and during 1918; and also $1.50 an acre additional for each acre of alfalfa cultivated by or for him prior to signing up during 1918 where the alfalfa has been or is intended to be marketed or sold. The balance is payable in two equal promisory notes, due in one or two years and bearing interest at the rate of six per cent per annum.

In return the organizers set forth the following aims: "To promote, foster and encourage the business of growing alfalfa, and aid in marketing, processing and warehousing and distributing it; to market on a co-operative basis; to deal in accessories; operate plants; establish offices; to finance the handling of crops, and the business; buy property needed and to furnish to all its members and growers its facilities at reasonable cost; to be a non-profit organization, and to be supervised by the State Market Director."

WHERE IS THE IDLE LAND?

[Written for Pacific Rural Press.]

Is there any waste land in your neighborhood—any good land that is not being used? Any land belonging to you or your neighbor, or to an absent owner that is capable of yielding a crop but now idle? That land ought to be in crop—it should be producing food. Will you aid in putting it to work? Write to the University of California and tell them about it. Tell them where it is and who owns it, and they will take steps to see that it is used.

The R and P tractor drawing a three-gang plow in heavy ground.

Last year 23,825 acres of land was leased through the efforts of the University. Much more might have been leased if good land had been available. Many people wrote that there was land near their ranch, but failed to give the location of the land or the name of the owner, making it impossible to get data on the land or to negotiate for a lease. This year the demand for land is even greater and every available acre of land should be reported and an effort made to get it into crop.

There are many retired farmers in California, men who have years of farming experience behind them, and who have available capital to farm a section or half section of land. These men want land, they are asking for acres to till. They are writing to the food administration in Washington and in San Francisco; they are writing to the State Council of Defense, and to the University. Their experience and their dollars can be put to productive work if the land is made available. There is an abundance of good land for these men. Will you help to locate it for them by sending the information to Prof. Chas. F. Shaw, College of Agriculture, Berkeley, and help to increase the production of food.

PACIFIC COAST LAND AND INDUSTRIAL EXPOSITION.

Thomas B. McGinnis of the San Francisco Board of Supervisors has been placed in charge of the city's municipal exhibit at the Pacific Coast Land and Industrial Exposition, which will open in Oakland, September 9, and continue until October 6.

"The exhibit will be a very beautiful one in cyclorama effect," declared Mr. McGinnis today. "Everything that this city is doing and intends to do—its interest in every department will be shown. There will be a background of the plaza, the Auditorium and the City Hall and the exhibits will all be placed under the direction of their various heads."

San Francisco, San Benito and Sacramento are already on the Exposition grounds preparing their space for the forthcoming event.

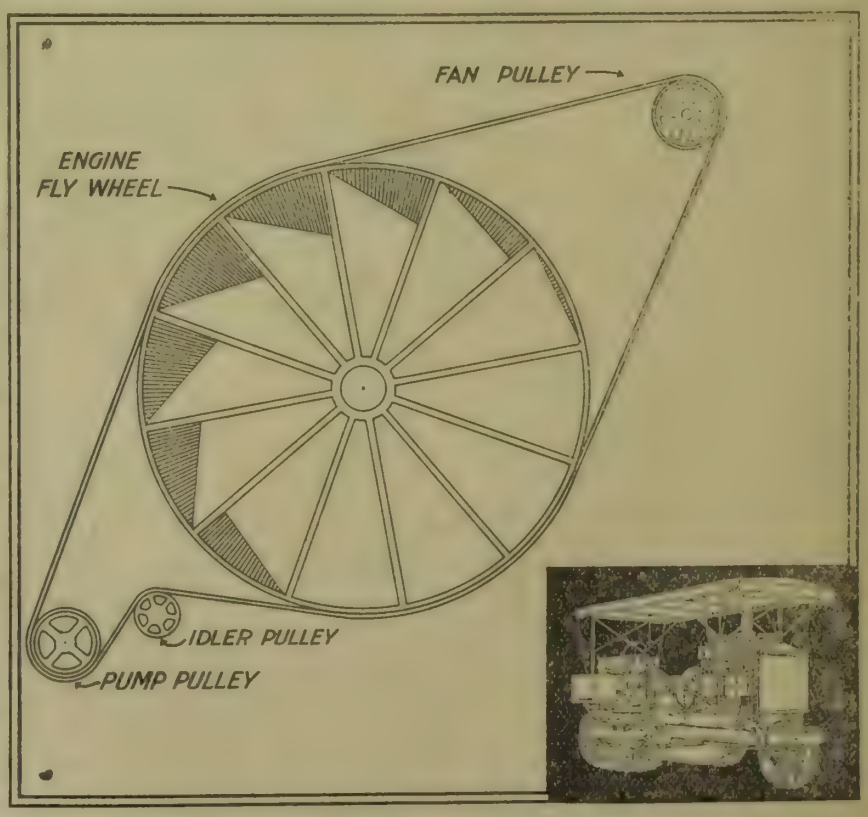
Farmers who have orchards or raise potatoes on a large scale are rapidly adopting tractor power to do their work. Those who already have them say that the tractor makes it possible to cultivate an orchard much better than it can possibly be done with horses.

To HOLT Tractor Owners

¶ The fan and pump belt on your Caterpillar Tractor performs a most important function. When it gives way the machine stops, maybe holding up operations for a day. That is why it is so important to have the right kind of a belt—one that won't slip, and that **lasts.**

Read what a Holt tractor owner writes about his "TEST SPECIAL" rubber belt: "It is the longest-life belt I have ever used for this purpose, not excepting any. Have used leather belts of different tannings, and different makes of canvas stitched belt, etc. Three weeks ago I tried another kind which is no good."

W. M. SHAW,
Artois, Cal., August 5, 1918.



You can obtain this belt through the Holt Manufacturing Company, Stockton, California. Or send your name to us and we will see that you are supplied.

FALL PLOWING CATCHES MOISTURE.

[Written for Pacific Rural Press.]

Better results generally follow deep fall plowing because it has longer to weather and it reservoirs more moisture. Many crops such as corn, sorghum, beans, etc., have no rain or irrigation during the growing season. Their supply must be stored in the soil from winter rains. Fall plowing left rough all winter catches most of the rain and enables it to seep slowly into lower soil. Burned-over stubble often puddles with the first rain and later rains run off. During an experiment in Utah a two-inch rain fell in 12 hours. Burned stubble land absorbed only 10 per cent of it. Land that had been plowed eight inches deep absorbed 70 per cent of it. If there had been a plowsole under the eight inches, it could have absorbed only what the plowed layer would hold.

DRY PLOWING RECOMMENDED.

Dry plowing has been carried out on University Farm six or seven years and the ground is in better shape than at the beginning.

Fall plowing for winter grain seeding does not require so good a seed bed because winter rains wash dirt around the seed and tend to fill air spaces. It leads to better crops because it gives the plants that much longer growing season.

DEPTH OF PLOWING.

The economically profitable depth to plow varies with soil and crop. Generally it will pay to plow seven to nine inches, deep for cereal crops, 12 inches deep for sugar beets and potatoes, 8 to 10 inches deep for beans, according to Prof. B. A. Madsen of University Farm.

Heavy soils normally pack together more, so water penetration and aeration are not good. They will respond to deep plowing better than sandy soils which are already aerated.

NEVADA NOTES.

Mason Valley, Nevada, like a good many other places, feels the effects of the dry year.

The second cutting of alfalfa is just about up and will average just about half a crop, the first cutting being a larger one.

The greatest shortage will be in the fall feed. Other years a great many cattle and sheep are fattened on the stubble and alfalfa fields in the fall season. This year it is estimated that there will be less than half the usual amount of feed. There is little prospect of being able to send much stock to Mason Valley to winter this year. One man was offered a half interest in 1500 head of cattle if he would supply feed for the winter. He had to refuse.

C. G. Swingle of Hazen, Nev., tried out a couple of acres of Mexican and Lady Washington beans last year. He netted about $175 per acre. This year he has eight acres in the two varieties. The warm weather of the last week insures a good crop. Mexicans seem to do the best. Teparies also do well.

MR. SHAMEL'S WORK PUBLISHED.

Increase in production and more uniform grade of fruit are secured by propagating only the most desirable strains of oranges. These facts have been emphasized by A. D. Shamel and other specialists of the United States Department of Agriculture who have been conducting investigations since 1909 in citrus fruit districts of California. The primary objects of these investigations were to ascertain the variation which has taken place; to determine the extent to which the different variations have been propagated; and, if possible, to control the extent to which undesirable variations shall enter the population of commercial groves. The data collected have been published in Bulletin 623, "A Study of Bud Variation in the Washington Navel Orange," and Bulletin 624, "A Study of Bud Variation in the Valencia Orange."

Avery Tractors Helped to Raise It
Avery Threshers Helped to Save It

THE crop this year has been a big one. It would not have been possible had it not been for modern motor machinery. Avery Tractors supplied a large amount of the power back of this big national crop. Avery Tractors and Plows turned thousands of acres of ground, prepared the seed bed and planted and harvested the grain crops. Avery Motor Cultivators planted and cultivated thousands of acres of corn, cotton and other row crops. Avery Separators threshed and saved millions of bushels of grain.

The Avery Company Will Exhibit at the Los Angeles Tractor Demonstration Sept. 17 to 21

An Averyized ranch means success. Tens of thousands of Avery machines are in successful operation throughout the world. There is a size Avery Tractor for every size ranch, an Avery Plow for every size Tractor and an Avery Thresher for every size run. With one of these outfits in the size you need and an Avery Motor Cultivator, your power requirements are taken care of.

Motor Machinery Specialists

The Avery Company are motor machinery specialists. Avery machines are built complete in the three big Avery factories and backed by prompt and permanent service through the Avery Branch Houses and Distributors covering every State in the Union and over 60 Foreign Countries.

When you get an Avery you get a Tractor with renewable inner cylinder walls, adjustable crankshaft boxes, patented sliding frame, patented gasifiers that turn kerosene or distillate into gas, and a tractor that you can attach instantaneously to any machine, either for belt driving or pulling at the drawbar—the coupler is automatic and the belt pulley is always in place.

All the special features in Avery Tractors as well as in Avery Threshers, Motor Cultivators and Plows are shown in big free Avery Motor Catalog. See nearest Avery Dealer or write direct for catalog.

Increasing Crops with Less Labor

[Written for Pacific Rural Press by R. E. Hodges.]

If a man raises ten sacks of anything per acre and it costs him the price of nine sacks, he has made a sack per acre profit. If the yield is increased 10 per cent, the profits are increased about 100 per cent.

Everybody has lots of money except "ye writer." Most everybody has a shortage of help. Everybody who has a right to live in America is ambitious to increase the production of essentials for winning the war and keeping up the morale of the allies. Not everybody realizes how best to spend his pocketful of money in a way that will enable him to carry out his patriotic ambition with the shortage of help.

Most of the reading and thinking farmers have, however, proceeded some distance along a road marked clearly so that "he who runs may see." The sign post reads: "To Greater Production via Machinery." We have exhorted much in regard to tractors, engines, electric motors, automobiles, and motor trucks, but there are a multitude of other machines investment in which will fill the gap caused by labor shortage and at the same time increase the yield per acre.

Among the great problems of agriculture are the maintenance of fertility and humus. Among the great wastes of American agriculture is that of the fertility in manure. As we visit farmers up and down the State, we are amazed at the decrepit manure piles we see in almost every community.

At present prices of nitrogen, potash, and phosphoric acid in commercial fertilizers, the nitrogen in a ton of fresh horse manure, including straw, is worth about $4.50; the phosphorus is worth about 36 cents; and the potash is worth about $3.30, making fresh horse manure worth about $8.16 per ton, and it is already on the farms. Similar figures for cow manure are $3.60 for nitrogen, 39 cents for phosphoric acid, and $2.10 for the potash, totaling about $6.09 per ton. These figures are based on the average plant food contents of many samples of average manure analyzed at several experiment stations. Additional value of manure lies in the humus, in which most California soils are particularly deficient.

But not all of its value is seen the first year of application. At the Rothamstead Station in England, barley was manured thirty years and then half of the lot was left unmanured for twenty years. At the end of that period it was still producing twice as much barley per acre as unmanured plots with all other conditions equal.

DRYING OR SOAKING MANURE.

Comparatively few farmers get full value from their manure. Only those get full value who save both the liquids and solids, and who spread them fresh in a finely pulverized, thin, even layer on fields where they will not be washed off nor leached beyond reach of roots. Drying in the sun does not appreciably reduce the value of manure, but drying on the outsides of piles alternated with wetting does reduce the value. A well-aerated, loose, moist pile of manure rapidly loses more than half its value by fermentation and escape of the nitrogen into air as ammonia gas. This happens to piles of manure left in field or in barnyard. A well-compacted pile kept perpetually soaked with water has very little chance to lose value by fermentation, but on the other hand the coarse material in it rots and makes better manure. The tramping of stock is a good way to preserve it from fermentation if enough water is supplied to exclude air. But with excessive water the phosphoric acid and potash are leached away unless held by a water-tight floor. A number of farmers in California have provided such floors. As that part of the plant food which leaches out is the part that is most readily soluble, what remains is less valuable pound for pound than what is lost. Director C. E. Thorne of the Ohio Experiment Station says that fully half of the fertilizing value of manure as it is voided from the animal is found in the liquid portion, so when this is allowed to run away through cracks in the floor we have lost half the value of the manure and have made the place insanitary. Plenty of bedding, not of wood shavings but of almost anything else available, absorbs the liquid and makes it readily handled. Drying out simply takes away the water, but the plant food is left ready to be used whenever it shall be soaked up by soil moisture.

THOROUGHLY MIXED IN SOIL.

Last fall we were taken to task because we recommended mixing manure with dirt around fruit trees planted where others had been taken out. Though we had said "mix well," the nurseryman who objected to the practice did so on the grounds that people would not "mix well" and that a great loss of trees resulted from using manure which was

You Sit Where You Always Sat On the Seat of the Implement

MOLINE UNIVERSAL TRACTOR

It Solves The Farm Help Problem

YOU wouldn't think of riding on the back of one of your horses while at work in order to guide your team. If you did you would require another person to operate the implement, because implements require constant attention.

Then why attempt to operate a tractor in a manner which your experience has proven impractical? It is just as illogical to ride on a tractor in front of the implement and expect to operate the implement from that position as it is to operate the implement from the back of your horse.

Any way you look at it you are working at a disadvantage with the ordinary tractor. To do the best work two operators are required, one on the tractor and one on the implement. In these days of extreme labor shortage this is a tremendous handicap. With the operator on a tractor in front of the implement it is manifestly impossible for him to give the implement attention and make adjustments for varying field conditions without losing time.

Just Like Driving Horses

With the Moline-Universal Tractor you sit on the seat of the implement and have perfect control of both implement and tractor. You are in the best position to observe the work, make adjustments and manipulate both tractor and implement. This holds true regardless of the work being done—plowing, discing, harrowing, planting, cultivating, mowing, harvesting, both grain and corn.

A Time Tried Principle

There is nothing new about this, we simply apply a principle which millions of farmers have demonstrated to be sound. The Moline-Universal gives one man control of greater power than is possible with horses, with the same method of handling and as much versatility. With the Moline-Universal one man can farm more land. It is a six-horse unit—easier to control than one horse and capable of doing the work of from 6 to 8 horses.

Works Day and Night

The One-Man feature is just one of many advantages the Moline-Universal has over other tractors. It is the only tractor which will do all farm work, *including cultivating.* It is the only tractor regularly equipped with self starter and electric lights. Non-robust labor can operate the Moline-Universal successfully, and it can be worked day and night.

No detail has been overlooked to give the new Moline-Universal Model D Tractor positive reliability. The perfected, overhead-valve 4-cylinder engine develops unusual power, and is economical in operation. It is conservatively rated at 9-18 H. P. Oil is forced to crankshaft bearings under 35 lbs. pressure. Gears are steel cut, drop forged, and heat treated. All shafts are splined. Every working part is easy to get at, and every moving part is enclosed.

Valuable Information for You

Our catalog tells how you can operate your farm with less help and expense by using a Moline-Universal Tractor. A post card will bring the catalog to you.

Since 1865 we have been making farm machinery, and now offer a complete line of both tractor and horse drawn implements. Information on any of the Moline implements listed below will be gladly furnished on request.

not thoroughly mixed with the soil before planting. Trees and plants cannot use chunks of manure. Such chunks are as bad or worse than dry clods of dirt. The manure to be of value must be in fine particles so its elements may be dissolved in many times their bulk of water before plant roots can take them up. It follows that the finer the chunks of manure are when applied to a field or orchard, the sooner the plant foods may be dissolved out of them, the sooner the remaining materials can decay into humus.

Few farmers have enough manure for all of their fields. It has been shown that a thin, even, finely divided dressing is much more economical than a thick one, especially if the latter is distributed in chunks.

HOW DO YOU LIKE TO PITCH IT?

But there used to be no worse job on the farm than to pitch heavy manure into a high box wagon and then pitch it off again while the team rambled along, not always in the line we wanted them to go. It was the job always left for the hired man. Its disagreeableness led to the toleration of fly breeding manure piles and foul barnyards on some farms year after year, while time, cultivation, harvesting, and expense all the way through were applied to crops that could as well have yielded 100 per cent or 500 per cent greater profits if the manure had been properly spread on the fields.

MANURE SPREADERS, LABOR, CROPS.

Some farmers in California are dumping each day's accumulation of manure onto a manure spreader and hauling it directly to a field which will be benefited. When no fields are available or the weather and soil do not permit, they dump into tanks, where the manure is kept soaked and improving in texture without loss by fermentation and heating. They spread a ton of manure over 50 per cent more ground than could by any reasonable attempt be covered with the same amount by hand. Every bit of its plant food is put where crops can use it. No chunks are dropped to poison plant rootlets that might attempt to grow into them. A finely divided thin carpet is laid out to be quickly incorporated with the soil when plowed under or to leach directly to root feeding ground if rains come before plowing. The job is not dreaded and postponed, for there is no pitching onto the wagon, no pitching off, no wading around in foul mud. Manure and a spreader can increase crops with less labor.

DON'T OVERLOAD YOUR TRACTOR.

"What a tractor will do and what it should do are two different propositions," said W. J. Burt of the W. J. Burt Motor Car Co., in replying to a question regarding the performance of the Bearcat Tractor, for which the W. J. Burt Motor Car Co. are distributors for California and Arizona, at a demonstration last week in a walnut orchard at Santa Ana, where the photo shown on first page was taken.

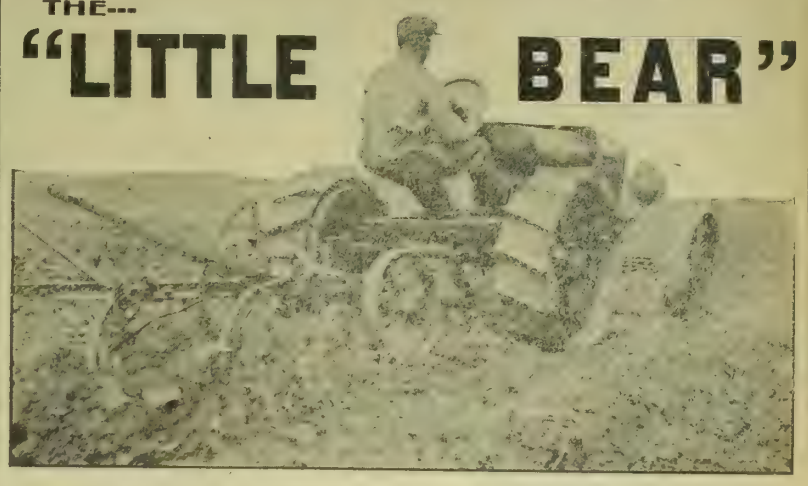
The Bearcat was pulling an 8-foot double disc with four large bags of sand as ballast which weighted the discs all down to the center, making an extremely heavy load for six large horses. The Bearcat pulled this load at a speed of about three miles per hour without any trouble and would go up one side of the row and down the other side of the same row, making the turns under load without any difficulty, and it will take the load of six horses and travel one-half faster than the horses, and at the end of 10 hours have done more than 10 good horses will do and with much less damage to the fruit and the trees, as the highest point of the Bearcat, under the load, is only 4 feet 4 inches.

Not satisfied with this test, in the same orchard W. J. Burt placed three men weighing 170 pounds each on the disc, in addition to the sand ballast, and still made the turn around a tree in second gear under this enormous load without difficulty.

The former is what it should do, and the latter is an overload, and any tractor working with an overload will not give as good results or accomplish as much as one working under normal conditions. Nearly every rancher's first desire is to see how much the new tractor will actually pull, and his next inclination is to keep it at its full capacity, while if they would keep its load where it is doing its work easily and work it a little faster, as the Bearcat's second name is "Speed," he will have accomplished more at the end of the day and will last much longer without repairs when working under normal conditions than when drawing an overload.

The number of recruits for our army that have been rejected on account of defective teeth is surprisingly large. In the majority of cases the blame for this condition is put upon the parents.

THE---
"LITTLE BEAR"



The "LITTLE BEAR" is a surprise to the orchardist. Every wearing part is enclosed and dust proof. The Bull Driving Gears are ENCLOSED and kept dust tight by a NEW DEVICE used on no other tractor. A DUST FILTER is furnished to clean the air entering the cylinders, keeping the cylinders and pistons free from grit and sand.

The "LITTLE BEAR" with 45-inch track and 50-inch wheel base, will turn in a 11-foot circle. For orchard work it has no equal.

Fenders are provided to protect low lying limbs and fruit for orchard work.

You Don't Have to Go to a Tractor School to Learn to Operate the

LITTLE BEAR

The same control used in the FORD is used in our TRACTOR. No experienced mechanic or Tractor operator required to handle it.

The "LITTLE BEAR" weighs but 1600 lbs. and does the work of four horses in less time and at one quarter the expense.

See the "LITTLE BEAR" in action at the Tractor DEMONSTRATION, SEPT. 17th to 21st, LOS ANGELES.

Manufactured under the FOUCH Patents by the

L. A. AUTO TRACTOR CO. 52nd and Santa Fe Ave. Los Angeles Cal. Tel. South 1600

California Fruit Growers Exchange Members can purchase the Little Bear Tractor from the Fruit Growers Supply Co., who are official representatives.

Power Shortage is Fuel Waste

Don't think you're saving by letting your engine, tractor or automobile motor run along short of power. The shortage is probably due to gas escaping through leaky piston rings—and you have to pay for it anyhow.

The surest way to get — and keep — maximum power and save fuel is to install a set of

McQUAY-NORRIS
LEAK-PROOF
PISTON RINGS

The piston ring which is properly designed and constructed to give perfect bearing on the cylinder walls —save friction and undue wear on cylinders.

Your dealer can get you any size or over-size quickly. Over 300 jobbing and supply houses in all parts of the country carry complete size assortments. If you have any difficulty getting them, write us.

McQUAY-NORRIS
Superoyl
RINGS

A special ring for engines that pump oil. Used in top groove only of pistons to control excess oil, with McQuay-Norris LEAK-PROOF Rings in lower grooves to insure maximum compression and fuel economy.

WATERLOO BOY
The Original Kerosene Tractor
For War-Time Speed in All Farm Work

Thousands of Waterloo Boy tractors are drafted into service to speed up farm work—standing the most drastic service tests in field and belt work.

Its three-plow pulling capacity and 25 horsepower at the belt, easy handling and dependability give it the widest range of usefulness on the average farm.

1 Man
2 Speed
3 Plow

Stands on the Bedrock of Over 4 Years Proven Success

The Waterloo Boy has long since passed the experimental stage. It has the confidence of the farming world because of exceptional performance in the hands of users.

Powerful, quick-starting motor, perfect kerosene-burning manifold, automatic lubrication, complete and easy accessibility of working parts, are some of the features you will appreciate.

Illustrated catalog, sent free, shows detailed construction and numerous photographic views of Waterloo Boy tractors at work on farms. Write for it.

The Killefer heavy engine chisel.

Home Vegetable Drier

[Written for Pacific Rural Press.]

At a time when tinplate for canning is way up in price and when it is so highly desirable to have vegetables the year around to displace breadstuffs, the drying of vegetables offers the most satisfactory way of saving them. Among the outfits that have recently been tried out is one that the writer has seen in operation, the "New-Way Vegetable Drier." Vegetables generally are peeled and sliced on a sauerkraut cutter, or in case of spinach, etc., they are cut up on a Sterling slicer. Potatoes are peeled in a cylinder with a roughened inner surface and a rapidly rotating bottom, while a spray of water plays over them. Deep-set eyes and imperfections are cut out by hand. After slicing, potatoes for potato flour are sulphured. For eating in the sliced form, most vegetables are merely blanched. The sulphuring is done on the drying trays, stacked 12 deep and covered with a lath frame on which building paper has been tacked nearly airtight. A handful of sulphur is placed in a pan under the trays and lit. About 30 minutes in the fumes are enough. The blanching is accomplished by dipping sliced vegetables in boiling water long enough to warm them through but not to cook them on the outside.

The drying trays are 2½ feet square, being simple frames over which is stretched a wire screen of three meshes per inch. Such a tray holds five to ten pounds of vegetables and is easily handled by a woman or boy.

The drier is a fireproof corrugated iron affair, the drying vault being 2½ feet wide, about 11 feet long, and 4 or 5 feet high. Angle irons, sloping slightly upward from the front along the side walls about 3 inches apart furnish supports for the trays. To avoid loss of heat in putting trays in or removing them, each is shoved through a lattice swinging independently of all the rest and dropping back closed as soon as the tray has passed into the chamber. The trays here also are 12 deep. Each one as it is inserted shoves the previous one farther along, so that the fourth stack is shoved out through similar swinging

The Sensation of The Tractor Demonstration

Los Angeles, Sept. 17-18-19-20-21

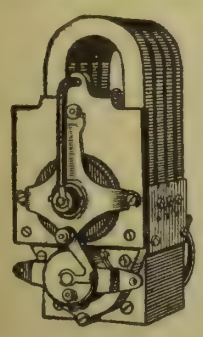
W. L. CLEVELAND CO. 213 No. Los Angeles St. LOS ANGELES, CAL.

The Appleton 14-28 tractor is the latest to arrive in the State. It is handled by C. S. Anthony, Los Angeles.

lattices at the other end. Sixty trays are used in order to push the fourth stack out with the extra set of 12 when the right time comes. The 48 trays furnish about 250 square feet of drying surface.

The vegetables are dried by free circulation of pure air heated without contact with the flame. A furnace under the front end uses either wood, coal, or a kerosene burner such as we saw. The fumes, smoke, and heated air from the flame passes through a smoke chamber sloping slightly upward lengthwise of the bottom of the dryer and full width of the bottom. Thence they pass up through flues and back through a similar chamber in the top of the drier to the front end, where they are drawn off through a smoke stack and patented roller-bearing ventilator. Above the smoke chamber is an air chamber of the same size, etc., opening by regulated doors to the outside air. The floor of this chamber is the roof of the smoke chamber, and, being of metal, it quickly heats the air and starts it toward the rear, which opens about 18 inches wide into the drying vault, where the sliced vegetables lie on the trays. Here it spreads all through the vegetables and finally goes out through the ventilator. Dampers regulate the heat and amount of air admitted. The ventilator is 12 inches in diameter and is supposed to exhaust about 20,000 cubic feet of cold air or 60,000 cubic feet of hot air in an hour with a four-mile wind blowing. Temperature in the drier is 125 to 150 degrees, the rear end being hotter because it is higher, because more heat is desired at the finish. Potatoes sliced three-sixteenths inch thick stay in about five hours—other vegetables a varying time as they need. The kerosene burner we saw running the drier burns a gallon per four hours.

Fruits also are sulphured and dried in the same way. The finished product is tempting and sanitary in every way.



Owners of tractors equipped with K-W Magnetos find they can fire thinner mixtures and cheaper grades of fuel and still develop full horse-power, than they could by any other system of ignition.

The intense hot spark that a K-W produces gets all the power out of every drop of fuel. It turns the ordinary wasted fuel into extra work *without* cost. A

TRADE K-W MARK High Tension MAGNETO

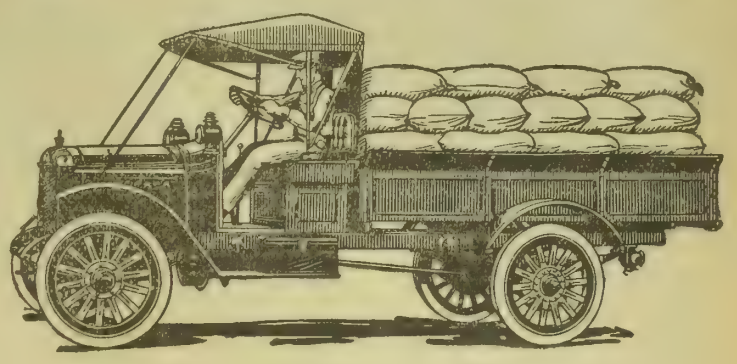
will start your tractor quickly and easily regardless of weather conditions and will operate on all the low grades of fuel. It gives continuous—no trouble ignition.

Forty tractor manufacturers pay more for K-W Magnetos because they want their users to have the best. K-W Ignition is one of your guides as to quality in your selection of a tractor. Insist that your new Tractor be K-W equipped.

If you are not using a K-W on your present tractor and wish to cut fuel cost — write us. There is a type of K-W Magneto that will do this.

TRADE THE K-W MARK IGNITION Co.
2889 CHESTER AVE. CLEVELAND, OHIO, U.S.A.

REPUBLIC
Internal Gear Drive
MOTOR TRUCKS
Built by the Largest Manufacturers of Motor Trucks in the World



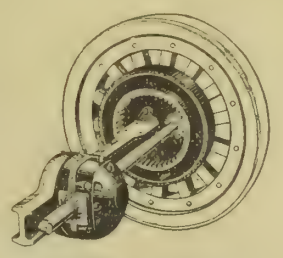
Republic Trucks on the Farm

Republic Trucks are particularly adapted to the special requirements of farm work.

Republic Trucks have an Internal Gear Drive with I-beam load-carrying axle of solid forged steel. The driving mechanism is entirely separate from this axle and has nothing to do but drive the truck.

The power is applied near the rim of the wheel, gaining greater leverage for hard pulls. And this Internal Gear Drive permits 45% greater load clearance, a big advantage for country roads.

There is less unsprung weight which means important savings in tires, gasoline and all upkeep expenses. Every part is simple in construction, easy to get at and easy to adjust when necessary. 1300 Service Stations, distributed all over the United States, stand back of Republic Trucks to see that they give continuously satisfactory service.



The Internal Gear Drive gets extra power for pulling over bad roads and up hard grades by applying power near the rim of the wheel.

Dependable — Economical Trouble Proof

Republics are easy riding and easy to drive. And they have proved so dependable and given such superior service to owners that it has been necessary to build more than twice as many of them as any other motor truck in order to supply the demand.

There are seven different Republic Models —¾ ton to 5 ton. One of these models will exactly fill your requirements.

See the nearest Republic dealer and send for latest booklet.

State Fair Farm Machinery

[Written for Pacific Rural Press.]

The largest, most representative, most concentrated and comfortable display of tractors, motor trucks, farm and dairy machinery ever shown at the State Fair was in place on the opening day, August 31, 1918.

Between 45,000 and 50,000 square feet of floor space under tents is occupied by farm implements and tractors exhibited by members of the California Tractor and Implement Association. About 4500 square feet in a nearby tent are occupied by additional tractors and farm implements, engines, irrigation equipment, etc. About 1500 square feet near the dairy barns is occupied by dairy machinery, including four milking machines, engines, pumps, silage cutters, etc. A tent with about 15,000 square feet is comfortably filled with motor trucks and trailers, while the space intended for automobiles has a smaller tent containing three makes of automobiles and several additional makes of motor trucks and trailers. At least 18 different makes of trucks and half a dozen of trailers are shown. Automobiles are not there in numbers because the association voted to stay out on account of doubled rates for floor space, as we heard.

To the man who wanted to compare the virtues of tractors, a two-row motor cultivator and over 70 machines of 25 different makes were there the first day, many of them with transmissions, differentials, and crankcases exposed for detailed inspection and many having tables spread with replacement parts to show what they are like. Several feature tractor exhibits deserve mention, but space forbids adequate description. Farmers who are prospective recruits in the increasing army of those who use disk harrows to save moisture and to work down plowed ground had the opportunity to compare at least 16 machines of various sizes and about 10 different makes. Of pulverizers there were samples of two or three makes. Of land levelers three manufacturers exhibited sizes from 4 feet to 10 wide and from scrapers to power lift machines. Two grain binders were shown, including one to be pushed ahead of a tractor, onto which it is fixed by a framework. Six grain or grain, rice and bean threshers of three different makes were there to be investigated. At least 18 moldboard gang plows of eight or ten different makes and of all sizes up to one with 14 bottoms, and 13 disk gang plows of perhaps seven different makes were there to illustrate the answers of attendants to questions put by visitors. Six or more different makes of pumps were pouring water back into tanks they drew from, being run by electricity or gas engines. Several kinds of gas engines and electric motors were there and four different systems of generating your own electricity on the farm were displayed, generally with electric washing machines, pumps, lights, storage batteries, etc. Irrigation equipment, pipe, tanks, and metal grain bins were shown by several companies and a ditching plow for tractor use was shown by another. A ditch scraper was shown by another. Silage cutters were represented by only four or five makes, three different bean cutters were there, three makes of grain drills, two makes of spray pumps, two auto and tractor schools were represented, and there was an additional farm machine of one sort or another in several of the displays. Farm machinery has come to be one of the leading features of the State Fair, as befits its importance at a time of world hunger and man shortage.

IS THE SOLID FOUNDATION OF

THE R & P TRACTOR

A PLAIN STATEMENT

The R & P Tractor is right because it embodies the design, workmanship and materials that make it right.

There is nothing experimental in its makeup—proved out under abnormal tests—trials that no practical user could or would possibly make—The R & P tractor bears the stamp of approval placed there by men who know every phase of tractor needs.

Every statement—every estimate—every specification regarding R & P Tractors is literal and means exactly what is stated. There is no need to mislead or employ extravagant terms.

The work that R & P Tractors perform—the hard use to which they may be subjected—will prove to any buyer that he made a wise choice when he purchased the R & P.

The R & P Tractor is an Investment, not a Speculation

Keep your eye on the R & P Tractor at the one big Tractor Demonstration

(Continued from first page.)

inviting disaster to one year's crops. Every man who buys a tractor for which he has not enough use to make it profitable is not only hurting himself but also hurting the other fellow, whose delivery is delayed on that account. But every man who can use a tractor to replace man- or horse-power will act well and patriotically in getting and sharing a suitable tractor and the expense of it with a neighbor or operating it himself for neighbors if his own ranch work alone does not justify the investment. Every man who buys a tractor not suitable for his work and soil is likely to knock not only that tractor but to lose confidence in all tractors. This is not fair to the tractor industry, for tractors are about as well standardized and dependable as the automobiles which we see at almost every farm shack and mansion.

There is only one really satisfactory way to select a suitable tractor. It is not an easy way at best, but is intensely interesting. The Demonstration is provided to make it as easy as possible. Do not be satisfied with one machine just because it works well and looks well. There may be one that works better and looks better in ways that you do not imagine. Go to the Demonstration and see all of them together. Talk on the quiet with the exhibitor of each machine that might possibly suit your conditions and make notes about it. Do not inquire the price—you will be in a far more intelligent condition to think about prices after you have asked each exhibitor to tell you wherein his machine excels others. He will tell you of things you did not dream were in existence. He will be glad of a chance to do it and will not reasonably expect you to buy his machine until you have talked with the rest and until you have seen them all plowing together in the daily hour-long public demonstrations. Your observations of the tractors at work together and in individual demonstrations, coupled with your knowledge of the strong points in the make-up of the other tractors, should enable you to satisfy yourself in the five days of this Demonstration just which tractor will save you most.

FEWER MEN NEEDED BY TRACTOR USERS.

Farmers in the corn belt are surely not getting the benefit from tractors they own as compared with California tractor users. The Research Department of the Standard Farm Papers recently received 167 answers to certain questions sent to tractor users of four States. Of 131 who answered the question, "How many days in the year do you use your tractor?" 26 used it between 31 and 40 days, 21 between 21 and 30 days, 19 between 41 and 50 days, and 17 between 51 and 60 days. Nearly two-thirds of them use their tractor less than 60 days in the year. That is partly because they have not yet adapted tractors to row cultivation, but not mostly so. They have not learned the various uses to which tractors are commonly put in California. Of 139 who answered the question, "What proportion of the time do you use your tractor for belt work?" 24 farmers said 33 1-3 per cent, 22 said none at all, 18 said 50 per cent, 16 said 10 per cent, 12 said 25 per cent, 11 said 20 per cent, and 11 said 5 per cent. Sixty-nine per cent of them use their tractors for belt work less than one-third of the time they are in use for all purposes. Two-thirds of the 167 who answered whether tractor farming enabled them to farm with fewer men said "yes."

Potatoes dug while the vines are green are likely to be injured in handling because the skin slips easily and blackens. A frost is needed before digging, to kill the vines so the skins will set.

See That Hitch!

THE Nilson Patented Lever Hitch is the greatest improvement in Tractor Design in recent years.

By hitching the plows to a swinging drawbar attached considerably above the rear axle, the pull of the plows is automatically converted into downward pressure, thus giving the drive wheels "GRIP" or traction, without a pound of useless weight.

It enables us to build a tractor with BIG TRACTION, LIGHT WEIGHT, FUEL ECONOMY.

Found Only On

The Nilson

Because of the Lever Hitch the Nilson Junior, weighing only 5,000 pounds, has 3,000 pounds drawbar pull at plowing speed, while the Nilson Senior, weighing only 6,400 pounds, has 4,000 pounds drawbar pull at plowing speed.

Nilson Tractors employ three driving wheels keyed on the same axle, making in effect a **WIDE DRUM DRIVE.** They do not pack the soil. They stay **ON TOP.**

It is the Lever Hitch and Drum Drive that enable the Nilson to easily outclass any tractor ever sold in California,—even those equipped with the same Waukesha Motor used in the Nilson.

Nilson Tractors have been thoroughly tried out, and "made good" in California.

See them at the Los Angeles Demonstration, September 17th to 25th.

Farm Products Must Increase

If we are to win the war and win it quickly our soldiers and our allies must be well fed. We cannot expect them to do their best to win unless we do our best to back them up. How are you going to make every acre of your farm produce to its utmost? Just as our army must be well fed so your soil must be fed. You must supply it with the elements necessary to produce crops.

GOLD BEAR FERTILIZERS

are scientifically manufactured to meet California soil conditions and crop necessities. They are made from animal products that contain the necessary elements to feed your crops.

Development of California's Fig Industry

[Written for Pacific Rural Press by John J. Fox.]

Tradition informs us that the first body covering of man to hide his nakedness was composed of fig leaves. I have often thought that in a fig climate such garments must have been rather short-lived and uncomfortable unless the ribs were trimmed down. Anyway, the fig is one of the earliest mentioned fruits in the Bible; and as it, together with the grape and the apple, were staple articles of food in Adam's day, so has California made the dried products a staple for world consumption in these latter years of grace through the study and sturdy co-operation of growers, nurserymen, and scientists—not only in production, but in processing and now, in marketing. Co-operation and the associations of growers have combined to lift our fruit men out of distress and uncertainty to a dignified status of stability, and an assurance that their members, if loyal to their brothers and their calling, will keep up the standards they have striven so hard to obtain. This applies to all the associations—raisin, prune and apricot, peach, pear, et al. Nowhere in the world has horticulture attained so high a pitch of perfection as in California, or where its products are more carefully standardized and inspected. Many of our most successful growers have had the advantage of a university education in horticulture and kindred subjects, which gives them the broadest knowledge possible to begin on.

A view of the Henry Markarian Calimyrna fig orchard near Fresno, one of the finest in the San Joaquin Valley.

The fig and the raisin are peculiarly adapted to the San Joaquin Valley, where there is ample heat and moisture, and a climate sufficiently hot and dry to mature and cure the crop in the sun.

VARIETIES CAREFULLY STUDIED.

In different sections of the San Joaquin Valley one meets with a well-defined difference of opinion as to the relative merits of the White Adriatic and the Calimyrna. But the Calimyrna man perhaps seems the most positive of the superiority of his product and believes that, given the same age trees and proper attention, the Calimyrna will bear as heavily as the Adriatic, in addition to the fruit being of superior size and quality. Men who are making a careful study of this young industry are well aware of the intricacy of their subject. That location, rainfall, temperatures, soil and water table all have to be taken into account. As an earnest of the equal division of opinion as to the relative merits of the chief varieties. I find that the nurseries are providing for an equal demand—half Calimyrna and half Adriatics.

THE WHITE ADRIATIC POPULAR.

The first large Adriatic orchard we visited was at the Bald Eagle Ranch at Modesto, which is now managed entirely by Robert McHenry—his brother having been called to the colors. This orchard consists of some 40 acres of 23-year-old trees, growing on land varying in character from a heavy loam to a sandy loam. The fruit was ripening (ready to pick September 1st) and we saw no split fruit. This orchard (part of which consists of border trees to other fields) produced last year 135 tons of dried figs, and the owner expects the same amount this year. Mr. McHenry thinks well enough of the White Adriatic to plant out 90 acres more, which are now two years old. He has just installed a new scrubbing machine. The figs are dumped into the hopper and sprayed with a sousing douch of brine—25 lbs. to 100 gallons of water. The figs are carried down on to trays, which are placed on trucks and run direct to the sulphur house while still moist, and are sulphured on the trays. They are kept in the sulphur house only four hours and then go to the drying ground. The sulphur house holds about seven tons to a charge and is in fourteen divisions. A tractor is used as power for running the washing machine and its tray carrier.

The trees are large and wide-spreading, as is natural to the character of the tree. They are pruned up only sufficiently to give passage through the orchard with the tractor. They have one irrigation and then the ground is kept well stirred. The outside and border rows carry about twice the amount of fruit that the inside of orchard bears. Mr. McHenry likes the White Adriatic because it gives him results, is a very regular producer and is the least trouble to take care of. The Hatch orchard at Fresno, of twelve and one-half acres of Adriatics, produces an average of three tons to the acre.

THE CALIMYRNA FIG.

Henry Markarian of Fresno has 160 acres of bearing figs sixteen years old, one-half of which are Calimyrnas and one-half Adriatics. He is resetting completely with Smyrnas and has recently planted out eighty acres more. He irrigates twice a year and attributes the splitting of fruit chiefly to soil conditions. A heavy moisture retaining soil, an excess of alkali, subirrigation are the chief causes. He says that over-pollination has nothing to do with split fruit. In 1913 he had the highest per cent of splits, culling 10 per cent. The year after he culled only 4 per cent, and last year less than ½ per cent. Lime seems to have helped overcome splitting in the heavier ground, and Mr. Markarian uses as high as two tons to the acre of hydrated lime not oftener than once in five years. He put 200 lbs. of lime around one tree where all the figs were split and left another, in similar condition, without lime. The effect observed the following year was, no split fruit on the limed tree while the unlimed one's fruit was all cracked.

Two hundred to 300 Capri figs to a tree are used for pollenization. Mr. Markarian says it is the greatest mistake to thin out the wood on figs, as it exposes the limb to sun burn and may result in the death of the tree if exposure becomes too great. They are just trimmed back at the tips. He is using more and more fertilizer year by year, and in addition to alfalfa or other humus

GROZ-IT

HIGHLY Concentrated - Pulverized

Manure

A mixture of cattle and sheep manure from animals fed on cotton seed meal and cake and alfalfa (highly nitrogenous foods) aged for several years under climate conditions that remove moisture but prevent leaching and fermenting.

No odor.

No flies or insects.

No weed seed or foreign matter.

Many times plant food values of ordinary manure.

Guaranteed contents.

Nitrogen, 1.5 to 2%.
Phos. Acid, P^2O^5, 1.25 to 2%.
Potash K^2O water soluble, 4 to 5%.

We are shipping GROZ-IT in immense quantities to Southern and Eastern states, where present freight rates make it $10 per ton more than cost to you.

Place your order now to insure delivery.

Sold in bags or bulk.

Write for circular and prices.

hauled on he applies 1,000 lbs, of bone phosphate to the acre one year and ¾ of a ton of superphosphate the next. Twenty acres of fruit thoroughly cared for and kept to its highest pitch of fertility and production, pays better than double the area with no care in fertilizing. His Smyrna figs average 18 to the pound, and he showed us one tree that he estimates will produce 500 pounds of fruit. Also one of his Adriatics that he estimated carried 600 pounds.

PICKING AND CURING.

The cost of picking and curing averages from $9.00 to $12.00 a ton. The figs are dried on stacked trays for one week and the Adriatics are then run into the sulphur house for five hours, using a quart of sulphur per ton. After they are washed in cold water containing one per cent of lime and five per cent salt, in which solution they are left for one hour or less. There are six pickings of this fruit and the harvest season lasts about six weeks. There are heavy plantings of figs now in project and of recent setting. J. C. Forkner is setting out 4,500 acres of Calimyrnas, and Cobb Bros. 700, to mention two of the largest individual plantings. All the way from Merced to Bakersfield figs are being set out on the eastern side of the valley and, in these young orchards, summer crops are being grown to pay for the cost of production, as figs should be set not less than forty feet apart.

Even without the large orchards now being set out, it seems that the fig in the above named sections would soon become a staple if only border trees were planted. The Smyrna fig is a leader because of its magnificent size and high sugar content. The Adriatic grower claims that his fig is less liable to split, is a sure bearer, does not sour so readily, and does not require the attention and expense attached to pollenization. That as a border tree it bears far more heavily than any inside orchard tree. On the other hand the Calimyrna (or Smyrna) grower says, "If you are in the business, why not produce the highest quality of fruit obtainable?"

STANDARDIZATION AND INSPECTION IMPERATIVE.

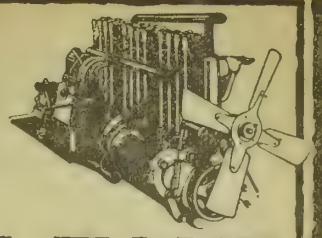
One thing is certain. If the fig industry is to grow and thrive, standardization and careful inspection will have to be practiced and the small figs used for jam or in some other way. If the fig growers of California expect to build up extensive markets they will have to see that no small or sour fruit goes out of the state. The present high price of the fruit is going to induce a heavy planting, and it means a long wait before the trees are large enough to produce a heavy crop. Mr. Markarian has expressed his intention of jam making, and this will probably give a very large outlet for the fruit in the future. The fig industry has come to stay and is being very carefully studied by men who are commercially successful in it. And in the section to which it is suited, the more these growers keep in touch with one another regarding not only the production, but the handling and marketing of their fruit, the sooner will it come to be classed among the staples of this great Inland Empire of California.

FUMIGATION FOR CITRUS TREES.

"Fumigation with hydrocyanic acid gas is the most satisfactory treatment for the control of scale insects on citrus trees. The dense foliage, together with the fact that it is evergreen, makes the citrus tree particularly unsuitable for spraying. It is not permissible to use a spray of sufficient concentration to kill all of the stages of scale insects, because of danger of injury, and the great difficulty in spraying is to hit all, or even a sufficient number of the scales to insure clean trees and fruit the following year. In the foregoing objections lies the failure of spraying citrus trees for scale."

The above quotation is from Prof. Quayle, who is probably one of the best authorities in the State on this subject, and Horticultural Commissioner C. F. Collins of Tulare county says that his experience (which is very extensive) convinces him that the above statement is correct in every particular. In the case of young trees or trees about dooryards, where fumigation is impossible or inconvenient, kerosene emulsion should be used, and the best thing to use with the kerosene is a washing powder. The time to spray is soon after the scale begins to hatch freely—about June 1st in Tulare county—and again early in August. This is also a useful spray for red spider and will remove moss. Fumigation is practical only in the hands of experienced operators and its beneficial effects should be good for two or three years.

A strong movement is on foot to have the Government build a storage dam on the head waters of the Walker river. This is the largest river in Nevada, and every year thousands of acre-feet of water go to waste. The crop loss this year in the valley would have paid for a big part of the cost of the dam. Then, too, there are large tracts of land that are desert wastes now that could be made to produce good crops with the use of water.



The Valve-in-head-type engine illustrated here, like all *internal combustion engines*, requires an oil that holds its lubricating qualities at cylinder heat, burns clean in the combustion chambers and goes out with exhaust. Zerolene fills these requirements perfectly, *because it is correctly refined from selected California asphalt-base crude.*

ZEROLENE

The Standard Oil for Motor Cars

It Keeps the Engine Young!

Zerolene keeps the engine young—full-powered, smooth-running, and economical in fuel and oil consumption—because it is correctly refined from selected California asphalt-base crude. Gives better lubrication with less carbon. Made in several consistencies. Get our Correct Lubrication Chart covering your car.

See the "Caterpillar" Tractor at the Los Angeles Demonstration

America must feed the world—a task that can be accomplished only by the employment of the most efficient methods and machines. It is, therefore, the patriotic duty of every farmer to visit the Los Angeles Demonstration and learn the "how and why" of modern power-farming.

See the "Caterpillar" Tractor there and learn why this tractor stands supreme. Study its construction—use of the highest grade materials, workmanship and design make this tractor able to do work that can be done by no other kind of tractor power, and to stand up for years of service under the most severe conditions. Learn how the tractor can improve your crops, increase your profits, lessen your labor and lessen costs.

"Caterpillar" Tractors have proved their merit on the battlefields of France. For more than a decade they have served the farmers of this country and every other agricultural nation. Thousands of satisfied owners testify to the superiority of this tractor. And the "Caterpillar" Tractor will do for you what it has done for others. Now, more than ever before, you should adopt this tractor for your work. See it at the Los Angeles Demonstration, or write today for complete catalogue.

CATERPILLAR
Reg. U.S. Pat. Off.

Here and There in the Fruit Business

[Written for Pacific Rural Press.]

Tulare County Notes.

Tulare county is second in the State in citrus acreage. Horticultural Commissioner C. F. Collins reports 38,260 acres planted or in bearing, with navels in the lead. Last year there were 1366 cars of Washington navel oranges shipped and about an equal number of Valencias, besides grapefruit and tangerines. The orange crop here is proving more disappointing this season as time goes on. The estimate now stands at 45 per cent for Valencias and 25 per cent of a crop of navels.

The peach crop will be about 65 per cent of normal and prunes 60 per cent, while table grapes and raisins will be 100 per cent.

Commissioner Collins tells us that in his campaign against squirrels this year his men have put out 110 tons of poisoned bait, besides using some thousands of gallons of carbon bisulphide and over a million cans of rodent exterminator when carbon bisulphide ran short. In addition to this, many farmers bought and used their own material and now squirrels are conspicuous by their absence. This campaign will result in untold millions of dollars of saving in the State and is an achievement of which the Horticultural Commission may well be proud.

Storm Water Protection.

A storm water protection district for the prevention of overflows from Bear Creek has been petitioned for in Merced county. The purpose is to keep the channel free from trees, brush and trash which arrest the flow of water in flood time and cause it to inundate the adjacent fields. The channel is to be opened, widened and straightened and any necessary dykes put in. The territory embraced in the project totals over 16,000 acres.

Until the district plan is adopted the County Supervisors will have the administration of the project, with the assistance of three honorary commissioners, who are to assess damages and benefits.

Salt Water Kills Orange Trees.

Death of a number of orange trees in the well-known Taylor orchards in the Lindsay district north of Porterville has been traced, according to orchard experts of that district, to irrigation water. Analysis made of the water pumped from the well on the property for irrigation of the trees is said to have shown a large percentage of salt. When the soil was impregnated with this sodium salt the trees began to die. Whether any remedy for the condition can be obtained is doubtful.

Fruit Pits for the Government.

It is claimed that charcoal from peach and other fruit pits has 600 per cent greater neutralizing effect than wood charcoal. The Government seems very anxious to secure all the pits available and the price set for the grower for peach pits is $7.50 per ton f. o. b. shipping point. When necessary the Government has agreed to furnish sacks for the accommodation of the farmer.

Pears Planted in Alfalfa.

Pear trees planted in alfalfa by L. B. Dutton of Santa Clara county in the spring of 1917 are fully as thrifty as others adjoining, which have been cleanly cultivated. The land is sediment adobe over adobe and so moist that it had to be tile drained before alfalfa would thrive. Each tree was hoed for a foot or two around the base.

Bees Profitable in Orchards.

H. Gunnarson of Kingsburg has 30 stands of bees for pollenization of his fruit trees. He says they are the best money-makers on the place. He has already sold 23 5-gallon cans of honey and expects to take off 23 more this season, contracted at $12 per 5 gallons. This will net him $400 for the season.

Imperfect Pollination.

In the peach districts around Dinuba and vicinity the larger number of split-pits is attributed to the action of frost by some growers. There were also a great many small, undeveloped peaches containing empty seeds, apparently due to imperfect pollination.

Unripe Melons Condemned.

Three thousand dollars' worth of unripe melons were recently condemned at Turlock by Horticultural Commissioner Rutherford, and several shippers were arrested for violation of the State law.

General Notes.

Fig growers are paying pickers from 14c to 15c a box for harvesting.

The Libby, McNeil & Libby olive plant at Nimbus, Sacramento county, is being doubled.

Day wages in Fresno run from $2.25 to $2.50 a day with board, and teamsters $3 and found.

Many peach growers are preparing to irrigate their orchards again when they have pumping plants or are able to obtain water in any way.

Mildew is reported from various grape sections and it is being pretty well controlled by the persistent use of sulphur. Wine grapes have suffered most.

The Eckstein Nurseries at Modesto report a large sale of Corey's thornless blackberry last year, sending a great many plants to Oregon and Washington and some to Texas and Florida.

Atwater, Merced county, is to have a district fair on September 13 and 14. There are a lot of grapes shipped from here, also it is the center of the sweet potato district. Atwater has six packing houses and one cannery.

J. Anderson, near Jackson road, Acampo, sold his Tokay crop last year at $125 an acre on the vine. We saw a crop of Tokays and Muscats that was reported to have been sold this year for $250 on the vine, not far from this, and it looked like a good buy, barring accidents.

Arthur E. Beers, Horticultural Commissioner of Merced county, reports a very busy season with the State-wide squirrel campaign, which has been added this year to the County Commissioner's duties. Mr. Beers also appointed a grasshopper inspector in one of his districts to take care of an infestation and provide against its recurrence.

The grape-leaf hopper has been so very busy this summer that it may not be out of place to mention that clean culture in the vineyard and all around the edges will assist in control of the insect. For, although this hopper lives entirely on the grape-vine leaves in summer, he lives during the winter on legumes, grasses and weeds and in the spring living also on berry vines and creepers till the vines are ready.

Thousands of Western Farmers Look for the Giant Trade Mark

GIANT FARM POWDERS
STUMPING — AGRICULTURAL

The Giant trade-mark on each case of Giant Farm Powder is put there for your protection. When you see it you know you are getting the real Giant Farm Powder—the kind that has been cutting blasting costs for more than half a century.

Giant Farm Powders—Eureka Stumping and Giant Stumping—have become so popular that many other high explosives are often in error called "giant powders." Don't be misled. There is only one brand of Giant Powder. Demand the genuine.

"I have tried all stumping powders on the market under every practical working condition," writes James Foran, Big Lake, Wash., "hereafter I will use nothing but Giant." Joseph Labunski, Cedar Camp, Ore., says, "Whenever I use powder, it will be Giant."

Send Coupon or Postal mentioning this Paper

and you will receive free the big book "Better Farming." It shows how your head can help your hands in making farm work easier, cheaper and more profitable.

Plant More and Better Wheat

[Written for Pacific Rural Press.]

Farmers who have become interested in the State-wide campaign under the slogan above, and who are planning to sow in accordance with the suggestions being made by the agricultural department of the Sperry Flour Company, which has launched the drive, will be interested in the following data on the history of Early Baart wheat. The information is contained in a letter received at the Sperry headquarters in Stockton from George F. Freeman, plant breeder of the University of Arizona, Tucson, who has followed the development of this variety for 12 years or more:

"With regard to whether the high rank of Arizona as a wheat producing State is due to Early Baart wheat, will say that it is so indirectly in this way. In early days Arizona grew a large quantity of wheat. It was principally of the variety known as White Sonora. This is a soft wheat, which is very suitable for the making of pastries and white biscuit, but with insufficient gluten for the production of first-class baker's bread. With this variety a number of flour mills were built in the State, but when the Southern Pacific railroad was put through and finally freight rates from the Middle West became reasonable it was found that the stronger flour from Kansas and Oklahoma wheats were so much better for bread making purposes that the flour from Arizona mills was practically driven off the market.

"With this condition of affairs one after another of the mills closed. The price of Arizona-grown wheat dropped, and the whole wheat-growing industry was on the verge of being abandoned. As a matter of fact, nearly all of the wheat that was still grown in the State was used as chicken feed, and the two or three mills which continued to run ground wheat, which was shipped in from the Middle West.

"About twelve years ago the Arizona Experimental Station, realizing the loss to the farmers by the gradual dying of the wheat industry, began to cast about for wheat varieties which would make grain of sufficient quality that the flour from it could to a certain extent compete with that shipped in. As a result, Early Baart, introduced at that time from Australia, was found to be very promising. It was turned over to Mr. Peters of Tempe Milling Co., who liked it so well that he urged that all the farmers in that vicinity grow this variety.

"From this as a beginning it has spread all over Arizona, then through Southern California, and is now well established in the Pacific Northwest. We might say, therefore, that the introduction of the Early Baart wheat was the means of saving the wheat industry in Arizona, and hence indirectly the cause of our high standing today in acre yields of this commodity. As a matter of fact, however, the peculiar soil and climatic conditions in Arizona are favorable to the high yields of any variety. One has no trouble on good land in growing 50 to 60 bushels per acre and I see no reason why the State as a whole should not average at least 40 to 45 bushels. I have grown as high as 67 bushels per acre in field plots of an acre or more."

EARLY BAART IN IMPERIAL.

With regard to commercially-grown varieties in Imperial Valley, where wheat acreage is supplanting barley acreage, partly on account of the campaign for more wheat, Robert A. Todd of Los Angeles writes that last fall, when he bought a carload of seed wheat, he accepted the suggestion to include enough for 50 acres of Early Baart because Arizona experience had shown that this variety withstood either wet or dry weather better than White Australian, which comprised the rest of the carload.

"If I had planted all of the acreage to Early Baart, I should have made more money than I did from the White Australian," writes Mr. Todd. "We had a few warm days the latter part of April and this greatly damaged the White Australian crop. The Early Baarts grew perfectly and yielded 20 sacks to the acre. The berries were plump and commanded the top price from the Government. The White Australian berries were small and were classed as soft wheat by the Government inspector. The Early Baart was easier to harvest than barley, but threshing the White Australian was the worst job we ever had on the ranch. The straw was as tough as Panama straw and I should have been unable to harvest it had I not had a harvester of my own. I intend to plant about 600 acres to wheat this fall and am looking for Early Baart seed."

ORCHARD BARLEY FED COW.

Fifteen dollars invested in a barley cover-crop in F. W. Orchard's 13 acres of fruit trees in Sonoma county furnished feed for his cow last winter which he figured saved $50 worth of hay.

Our Beans as a War Ration

[Written for Pacific Rural Press.]

The announcement that the California Bean Growers' Association, with headquarters at Stockton, is this week rolling carload after carload of beans eastward for shipment to a neutral European country is good news. It is pleasant to think that although California's carry-over of beans is lighter than usual, we are still able to send heavy cargoes overseas without waiting for the new crop.

It is not accidental that these half-famished Europeans have called for California beans by the shipload. Besides the ease with which they can be transported by rail or water, beans have proved to be higher in nutritive value than the average American had ever guessed.

Some idea of the food value of the California bean can be gleaned from interesting data furnished to the California Bean Growers' Association by Prof. M. E. Jaffa, the famous expert in dietetics of the University of California. Prof. Jaffa knows beans—knows them botanically, culturally, structurally, chemically and otherwise analytically—and he knows the difference in the heat calories produced in a hungry man by a dish of the demure, chaste Lady Washington, of the coquetish Blackeye, of the blushing Pink.

Taking Prof. Jaffa's figures as a starting point, the statistical department of the California Bean Growers' Association has visualized the table of equalities in a startling way. Let us suppose that the cost of living is getting on your nerves and you go to the grocery with an analysis of the calories contained in various kinds of foods "in the raw," and you want to get all the calories you can for your little dollar. Starting with the average of all varieties of California beans as a basis, you know that a pound represents 1615 calories. (You are not supposed to know what a calory is any more than you know what a kilowatt of electric current is, or a cubic foot of invisible gas, but you at least know that the people whose business it is to know these things use them as units of measurement as accurate as a yard-stick or a postal scale.)

If you wish to order your assignment of groceries scientifically, according to calory value of each staple food, you may use a pound of beans as your mental yard-stick, remembering that it contains 1615 calories. You can get approximately the same number of calories by buying a pound of flour or a pound and a quarter of bread, or you would have to order two and a quarter pounds of beefsteak, or at least four pounds of potatoes or one dozen and a half of eggs or three pints of milk or nearly a pound of cheese, in order to secure the caloric equivalent of your pound of beans.

If your selection of groceries is influenced by the cost price, consider that a pound of beans on a certain date may cost 10c. On that day, according to season, you might get two eggs for 10c, and they might be from the cold storage hen. To get the full caloric equivalent of your pound of beans you would have to buy 90c worth of eggs.

FILL STOMACH WRINKLES.

But there is another important factor to be considered when you are thinking about California beans as a war ration, as pointed out by Prof. Jaffa. It is true that when you buy a pound of beans and one dozen and a half eggs you get the same number of calories, measured "in the raw." When you cook the egg the ratio of calories to weight remains practically unchanged, but when you put your pound of beans into the pot they swell out with the absorbed moisture and the weight is greatly increased. This absorbing quality of the California bean is of tremendous importance under conditions where shortage of food is a distressing factor. When a man is painfully hungry, a full stomach is a solace beyond reach of words, especially if he has a day's work to do he is not worrying about the number of calories that he crowds down his esophagus — he merely wants the wrinkles of his stomach pressed out with food. The bean does the trick admirably with a minimum of expense. If you will search the grocery through, you will probably not find any other food of equal calory value that has this quality of giving the "full" satisfaction. Filling hungry European stomachs with our beans during the period of short rations will, in the judgment of the California Bean Growers' Association, have the inevitable result of teaching Europe how good our beans are, especially if they learn how to prepare them in different ways. The outcome will be a permanent demand for California beans after the war has ended. The association plans to have a special foreign department which will stimulate the demand from foreign countries and justify even an increase in our present large acreage of beans.

The necessity for collective marketing is shown by the fact that the California Bean Growers' Association includes practically all of the largest bean growers in its territory as well as the smallest producers. One member, for instance, has 30,000 acres of beans under cultivation this year. Allowing an average of only 12½ sacks to the acre, his yield would be 375,000 sacks of 100 pounds each. Suppose that at normal conditions should reduce the price so that he should average only $7 per sack, the market value of his crop would be $2,625,000. Yet even this grower, after experience in individual marketing, decided that his output was not large enough to enable him to market his beans to as great advantage as would be the case if he were in touch with his fellow growers. That is why he joined the association.

BEANS SEVEN INCHES—ALL SUBMERGED HARMLESSLY.

[Written for Pacific Rural Press.]

Some 10,000 acres of beans are normally sub-irrigated in the Natomas reclamation in Sacramento county from drainage ditches. These ditches are in two systems, one draining into Pritchard's "Lake," whence the water is pumped over the levee into the Sacramento river. The other system drains to the southern end and is pumped over by another outfit. The aim is to pump out enough in the spring to leave the water-level about a foot below the land-level, so it will seep through the loamy sediment. This year being exceptionally dry, the water became too low in the ditches and before they were filled by pumping from the river the beans became rather dry when they were about seven inches tall, and did not seem to grow at all for about ten days. The ditches were pumped full, but seepage was not fast enough in this emergency. The land is naturally level; so with no artificial leveling, checks were thrown up and the big pumps overflowed ditches and flooded many acres of beans so just their tips were out of water. The soil is loose and deep, so the water was generally off in two hours. A week later, which was about August 24, the beans had doubled in size and in many places were so nearly matted that they could not be cultivated after the irrigation. Beans on low spots where water stood over two hours suffered by scalding and some have died. Where beans were in bloom, they were not flooded so deeply. Wherever the water was on not over two hours the beans have done splendidly and no harm has come from the flooding.

Field and Garden Suggestions

[Written for Pacific Rural Press.]

Mountain Wheat Notes.

In a trip through Chico, Susanville, Modoc county, Reno, and home a party of San Joaquin farmers and men from the agricultural and chemical departments of the Sperry Flour Co. noted some 70,000 acres on the Madeline Plains, near Ravendale, adapted to wheat culture but not much farmed. Irrigated lands in the lower end have produced fine crops of rye and oats. At the upper end, with an elevation of 5000 feet, they thought spring wheat should be replaced by winter wheat to permit the roots to make growth necessary for a maximum crop during the short summer and fall months. The general practice is to sow in May after snow melts, but better use of the snow moisture would be gained by fall seeding. Lack of rain has been disastrous this year to wheat in the Big Valley section of Modoc county; but in the Honey Lake district of Lassen county, irrigation has saved the day. No finer wheat had been seen north of Tehachapi. Good acreage was planted between Susanville and Doyle and the yield seems heavy. Binding is now in full swing.

Powdered Vegetable Soup.

In a minute our Sammies in the trenches may have nourishing, delicious hot soup such as the writer has this day enjoyed in the offices of E. Clemens Horst as the guest of Frank George. Six or eight different vegetables of only the fanciest quality have been cooked, dried, and ground. Two ounces of the product makes four big platefuls of thick soup, with no boiling at all, though some boiling won't hurt it. The two ounces contain the same nourishment as nearly one and a half pounds of fresh vegetables. Samples of the powdered soup are being sent East to Government authorities and to the hotels, restaurants, steamship lines, etc., which are already using the Horst California dried vegetables in preference to the "fresh" vegetables they can buy in their own markets. Various soup mixtures will be put up in the future and may well form part of every camper's rations.

Ethics in Vegetable Packing.

Before standardization, the foreign and other truck growers were prone to line up the cracks of their tomato crates with nice, red, smooth tomatoes, filling the inside with small, unripe or otherwise inferior fruit. Sweet potatoes the same. The cracks in the crates showed, and do still show, those of nice size and shape, which is not always an earnest of what may be found within. From time immemorial it has been the custom to set forth the most attractive wares and to conceal imperfections in bulk from the purchasers. But the ethics of modern business demand a reliable pack and painstaking quality. Co-operation and standardization are the only means of insuring these results.

Bean Growers' Association.

The original object of the California Bean Growers' Association to control 1,000,000 bags of beans this season was surpassed by July 31, and half a million more had been signed up a month later under the new objective of 2,000,000 bags. Growers outside of the territory already covered by the association from Salinas and Turlock northward are not being solicited to join until this territory is well consolidated and the marketing is well under way. The 1917 carry-over is being marketed by the association at present.

Adobe in Hay.

Fifty pounds of adobe and rocks were found as an average per bale in a large shipment of hay not long ago when it was inspected by State Superintendent of Weights and Measures C. G. Johnson. One bale contained 80 pounds. In another shipment of 150 bales they averaged 32 pounds each of dirt. Some adobe is bound to get mixed in hay, but at the rate above the farm would soon be sold in small subdivisions and at subdivision prices.

Merced's Tomatoes.

Merced county has the monopoly on tomatoes lasting from two to six weeks, according to season. It may begin the end of May, when the Imperial Valley is usually through shipping, and last to the middle of July, when other sections are shipping. Large quantities are shipped to Canada, Portland and Seattle. This year 40 carloads were shipped in carload lots.

Choking Foxtail from Alfalfa.

Alfalfa is practically freed from foxtail by Robert Collier of Solano county. Three or four years ago he intended to cut a crop after the last irrigation, but did not get to it. Foxtail started when rains came, but the heavy coat of alfalfa smothered it. He has done the same thing purposely since then. His brother sows grain in alfalfa nearly every fall for this purpose.

October Rain on Potatoes.

An October rain on main crop potatoes will crisp the tubers and make them keep months longer than if they are dug without rain, according to H. A. Hyde, who grows potatoes at various places in Cali-

Farm for Profit

and help U. S. win the war

Authoritative tests have proved that as high as 50 per cent increase in crop production may be expected from the proper use of fertilizer. Do you realize what that increase means? Fertilizer is the basis of crop production, and compared to the prices of the crops they help to produce, fertilizers were never so cheap as they are today.

MORE CROPS

will be raised in America this year than ever before. Make every acre you own or rent produce to the limit. Fertilize your land—the increase in yield and price of crops will more than pay all the fertilizer expense—it will enable you to farm with profit. Don't spend your time working worn out land. Make it pay—Fertilize with Hauser's Organic Fertilizer.

THE DRIED APPLE INDUSTRY.

[Written for Pacific Rural Press by A. W. Tate.]

Chinese firms at present control some 80 per cent of the output of dried apples at Watsonville and would doubtless control it all were it not for the introduction of modern labor-saving machinery which has enabled a few firms to compete. Today there are 84 kilns operating in Watsonville and its immediate vicinity, employing over 1400 people. Their output last year was 5181 tons of dried fruit or nearly 50 per cent of the total apple production of the Pajaro Valley was dried.

Probably the largest dryer in the world is owned here by the Unglish Bros. on Main street. They employ 50 people for 30 power-operated peelers and the dryer has a daily capacity of seven dried tons.

The U. S. Government was the best customer last season. It is estimated its purchases amounted to 75 per cent of the total output, for which it paid in the neighborhood of $1,500,000.

At present it is usually considered that the cost of drying is about $50 per ton, exclusive of the cost of the fruit. The average paid for drying apples in 1917 was $17.50 per ton, though towards the end of the season as high as $35 was paid. A conservative estimate of the average price received for dried apples would be 10½c per pound.

It is of interest to note in this connection that a large number of the drying firms lost money last year. Dried fruit was contracted early in the season at ordinarily fair prices, but as the price of dried fruit advanced packed apples and dryer stock shot upward and in order to fill their contracts dryers had to pay the advanced prices.

DROP OF ORANGES REDUCED.

Very encouraging results in the prevention of the June drop of oranges have been obtained at Edison this year by J. E. Clark, superintendent of the Edison Land and Water Company, as described in the Kern County Farm Bureau Monthly.

On one tract of five acres melilotus alba, seeded at the rate of 15 pounds per acre, and vetch, at the rate of 10 to 12 pounds per acre, were planted in February as a summer cover-crop. The growth of the cover-crop, particularly the melilotus alba, was very luxuriant, plenty of irrigation water being provided. The effect on the temperature, physical condition, and moisture relations of the soil was very marked and the orange trees are in a healthy, vigorous condition. Mr. Clark estimates that the crop of oranges on this five-acre tract will amount to at least 400 boxes, as compared with only a few boxes from the same orchard last year.

Another 30-acre orange orchard was seeded to vetch and melilotus alba, at the rate of 30 pounds of vetch and 6 pounds of the clover. The amount of fruit on these trees is also very satisfactory and noticeably greater than in an adjoining orchard where no cover-crop was planted. The growing of a summer cover-crop is only feasible where there is a sufficient supply of irrigation water for both the trees and the cover-crop.

MONTHLY CROP REPORT—STATE AVERAGE.

	Per cent		Per cent
Walnuts	83	Pears	83
Prunes	72	Peaches	75
Plums	74	Oranges—	
Olives	70	Valencia	84
Grapes	95	Navel	63

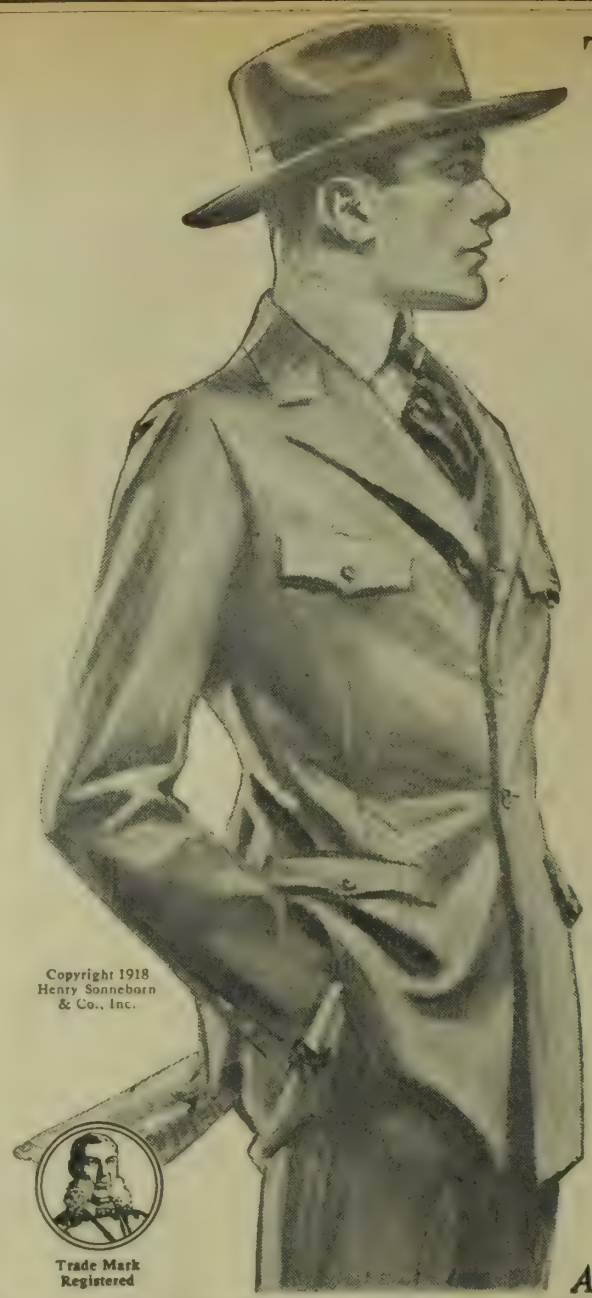
Apricots	80	Berries	90
Almonds	70	Apples	75

Figures indicate condition of crop in percentage on the basis of 100 as normal.

A Government entomologist, investigating the district around Gridley for evidences of the new pest, the Oriental peach moth, one of the worst enemies of deciduous fruits known, found none in the vicinity.



The nation's standard in clothes of moderate price

Styleplus are the only clothes in America identified each season at nationally known prices.

Each Styleplus grade is one price the nation over.

We center our volume on a few grades—cut down the expense of manufacturing—this is the reason behind the famous Styleplus quality.

No matter where,—no matter when—you buy Styleplus Clothes you *know* they are right in style, in wear, and in price.

Go to the Styleplus Store and see for yourself. Try on the clothes. Get exactly the kind that suits your build and your taste—that fit right and look well.

When you see your clothes before you buy them you know what you are getting. Buy Styleplus and you will always be sure of the big value at a moderate price.

Two grades in Styleplus suits: $25 and $30.

Three grades in Styleplus overcoats: $25, $30 and $35.

Sold by one leading clothing merchant in most cities and towns. Write us (Dept. AA) for Styleplus booklet and name of local dealer.

Still Better Tillage Tools

Deering—McCormick—Osborne

HAVE you seen the **New Third Lever** on a **Deering, McCormick,** or **Osborne** Three-Lever Disk Harrow? It is a depth regulator. With it you raise and lower the inner ends of the disk gangs to meet *all* field conditions. You do this quickly and easily, without in any degree destroying the rigidity of the gangs, for which International Harvester disks have always been famous.

Have you seen the **New and Exclusive Attachment of the Tandem?** This is another feature we are proud of. The connecting braces tie to both leading gangs, extending from the tandem in such a way that the gangs *must* cut the ridges left by the leading gangs. In turning corners, the sliding connecting braces allow natural flexibility and following of the tandem without crowding sidewise.

International Harvester disk harrows have done top-notch good work for many years. They have built-in weight boxes, adjustable forecarriage, 4-wear wood bushings, tall hard oilers, etc., etc. This year they are simply unbeatable.

When you want seed beds that are right, be sure your tools—disk harrows, peg and spring-tooth harrows, cultivators, etc.—are **Deering, McCormick** or **Osborne.** Write us.

MAKE THE JACKASS RABBIT WIN THE WAR.

To the Editor: I send you a copy of a letter I am sending to the State Food Commissioner:

"Dear Sir: I have a conservation idea which, if carried out, would surely be a benefit to California and a source of profit to some enterprising manufacturer. Jack rabbits do considerable damage in some sections. They could be utilized in the following ways: Remove the hair (not the skin) then boil and cool and save the fat for soap making. The meat could be dried and sold for chicken feed and the hair could be utilized probably for plaster or some other purpose. To catch the rabbits drives could be arranged and the proceeds go to the Red Cross. T. S. Burnight, Calistoga.

[Perhaps you wish us to ask you what to do with the ears, so that you can tell us to put them on as a reward for publishing your communication! But perhaps you are serious about it and then we have to ask whether you have figured the cost of the plant, which would be required to make such products economically, the cost of the labor to operate them, the cost of the selling campaign which would be needed to create a demand for the products, the time which would be required to get all these things in operation and what would become of the investment after the first few drives had reduced the jacks to the normal requirements of pot-hunters for rabbit stews?—Editor.]

GRAFTING OVER WINE GRAPES.

[Written for Pacific Rural Press.]

We recently visited several vineyards in Fresno, Merced, Tulare and Madera counties, where old Zinfandel vineyards had been grafted over to Thompson Seedless, though we did not see any where the Zante currant had been tried. In each instance there was a sprinkling of Zinfandel vines, showing that the work had not been followed up closely enough or the work needed more supervision.

Generally speaking, the vines were fairly strong and thrifty and were bearing an average crop for the year, which is less than last in most Thompson vineyards. On 12-year-old vines we thought that better results would have been attained if two grafts had been put in instead of one, so as to callous over more quickly—also the stub could profitably have been dressed over with asphaltum to make it last longer. The unions are good and grafts made about level with the ground, so they could be covered. The best crop we saw of these worked-over vines will produce about two tons to the acre of dried fruit.

MERCED COUNTY MENTION.

Merced county raises about one-half of all the sweet potatoes produced on the Pacific Coast. Her acreage in this crop is about 4000 acres. We saw one field of 950 acres, rented by the Arkalian Bros. The crop runs from two to two and a half tons to the acre and has been bringing $3.50 per 100 pounds, as compared with $2.50 last year—a record price. A good many are being shipped this year in half crates.

Blackeye beans are a good crop here and do better than any other. Gyp corn is also a good crop this year and is said to pay as well as the cow pea, averaging a ton to the acre.

Merced county claims 10,000 acres in beans and 94,000 acres in alfalfa. The west half of the county is entirely given up to dairying, alfalfa and stock.

The Berkeley Federal Land Bank has loaned $7,182,700 and has approved loans for $4,685,560 more. Of these totals, 1776 California farmers have received, up to August 1, $5,494,500, with approved loans totaling $8,843,760. Nevada farmers have received $153,900 of the $208,300 approved. Arizona farmers have received $271,300 of the $515,000 approved.

Why the cost of producing cattle does not determine their selling price

TO produce a steer for meat purposes requires, as you know, a period of from one to three years.

The prices the producer has to pay for feed, labor and other items during this period, together with weather conditions, determine what it costs to produce the steer.

But the price the producer receives for the steer depends on conditions existing at the time it is sent to market.

If the supply of cattle coming on the market at this time is greater than the consumer demand for dressed meat, the prices of meat and live stock go down.

On the other hand, if the number of cattle coming to market is less than enough to supply the consumer demand for meat, the prices of meat and live stock go up.

Not only do the receipts of animals vary from week to week but the consumer demand for meat also fluctuates.

The rise and fall of prices results from an economic law that operates in every business. It is the packer's task to turn live stock into dressed meat and by-products, and distribute them to the consumer under control of this law.

Market conditions and competition establish the prices the producer gets for his cattle. When meat prices go up or down, so do cattle prices.

The packer can't pay out more money for animals than he takes in from the sale of meat and by-products.

Swift & Company will gladly co-operate in the carrying out of any national policy that will tend to steady the prices of live stock and meat.

Pays to Feed Dairy Cows Well

[Written for Pacific Rural Press.]

In answering the question, "Does it pay to feed high-priced concentrates to cows?" a prominent and successful dairyman replied: "I never yet saw the time when feed prices were so high that it did not pay to feed a good cow to her full capacity; also, I never yet saw feed so cheap that it paid to keep a poor cow." There you have the situation in a nutshell. Test the cows. Sell the unprofitable ones. Use the money to buy grain for the rest. And the few good cows, fed to their capacity, will make you more money than the larger herd did under the old method of limited feeding.

Not right away, though. If you add 10 cents' worth of grain to a cow's ration today, you must not expect to get 10 cents' worth of extra milk from her tomorrow. You must be satisfied with the cumulative effect, not only upon the present lactation period but also upon the following one.

A test was conducted at one of the experiment stations, in which one lot of cows was fed liberally on concentrates during an entire lactation period and another lot received none. After freshening, neither lot received concentrates. It was found that the cows in the first lot produced much more heavily than those in the second, evidently having stored up a reserve during the year of heavy feeding. Furthermore, they held up well during the entire second year, while the cows in the second lot let up on their flow after three or four months and finished the year in very poor condition.

So in deciding whether or not to feed your cows concentrates put on your long lookers. Consider not only that their flow will be increased somewhat, but that they will hold up longer and will be in better shape for another year's work. They will be able to furnish better nourishment to the calves they are carrying, and this will result in larger and stronger calves that will make greater and cheaper gains. The cows will breed more regularly, and will have greater constitutional vigor, so will not be so susceptible to disease.

If you are feeding silage to supplement alfalfa or other roughage, it is doubtful if it would be advisable for you to add grain to the ration at its present price. Silage at the rate of 30 pounds per day for a cow weighing 1000 pounds, together with all the alfalfa she will consume, is about all that a patriotic cow can expect at this time.

But if you have been feeding alfalfa alone, you will find it profitable to add a small amount of grain. Prof. Eckles, the well-known authority, offers a schedule as follows:

Lbs. milk daily.	Lbs. grain daily.
25	3
30	4
35	5½
40	7
50	9

This does not mean that a high-priced grain ration needs to be used. Beet pulp makes a fine combination with alfalfa—is a good substitute for silage. Six parts dried beet pulp, two parts rolled or ground barley and from one-half to one part coconut oil meal, by weight, makes a cheap and satisfactory war-time ration. Add three-quarters ounce salt for each cow and let the entire mixture soak for twelve hours in five times its weight of water, which is about the amount it will absorb.

If the hay can be chopped, a waste of from 15 to 25 per cent will be saved, and if straw is substituted for one-fourth of the alfalfa a still further saving will be effected.

Kindness to Dairy Cows Pays

[Written for Pacific Rural Press.]

A Holstein breeder had a three-year-old heifer that had milked so persistently that he had been unable to dry her up until five days before freshening. He did everything that he could think of to stop her flow of milk, including cutting off her feed to such an extent that when she freshened she was little more than a skeleton.

However, he wanted to give her an official record of some sort, so he placed her in the care of a man who was not familiar with official test work but who said he had milked a little and was willing to follow instructions. The owner's advice to the attendant was: "Be just as kind to her as you can."

Knowing the conditions under which she was working, the owner made up his mind that a 16-pound record was all he could expect, and you can imagine his surprise when she finished with nearly 23 pounds to her credit.

He found the secret one day when he chanced to enter the stable unannounced. There in the stall lay the heifer, and curled up between her fore and hind legs, his head resting upon her side, lay the milker, fast asleep.

Who will dispute the owner's claim that the last seven pounds of that record was due to care and kindness?

WILL REGISTERED COWS PAY?

Are you wondering if you can make registered cows pay? Perhaps you haven't the money to buy animals with fancy pedigrees and high records; neither are you in a position to do official testing. And you wonder if the kind of registered cows within your reach will pay.

Here is the proof: A year ago A. J. and Nellie A. Morey of Orland bought the Jersey cow, Gertie's Fox Alene, from N. H. Locke for $300, and showed her at the Glenn County Fair. She was made grand champion and won two prizes of $20 each for highest butter production.

She dropped a bull calf, September 20, and he was sold for $100. In nine months she produced 400 pounds of butterfat, which sold for $180. Thus the cash returns were $320, to which must be added the value of the skim milk fed to calves and pigs, worth probably about $48, and the manure, worth about $6.

Here is a grand total of $374 for the year. Take two cows in your dairy worth $150 each and figure what they returned you during the past year. Like as not you will decide that one registered cow at $300 will make more profit for you than two grades worth $150 each.

W. T. Roberts of Penn Grove reports a very heavy demand for milking Shorthorn bulls, and has only four left, but these are good ones and will be offered soon. Mr. Roberts is thinking of showing at San Francisco.

The Jersey cow, Spermfield Owl's Eva, owned by Meridale Farms, New York, has answered the question as to whether a cow can retain her milking qualities after having made a great record, by completing her sixth official yearly test at twelve years of age with a record of 15,504.2 pounds of milk and 833.72 pounds of fat. This is next to her best record, made at eight years of age, when she produced 16,457.4 pounds of milk and 993.30 pounds of fat.

The Guernsey cow, Linden Girl of Harbor Hill 3rd 58625, has recently completed a record in class CC of 15,032.9 pounds of milk and 785.89 pounds of butterfat. This record makes her the champion cow of the breed in this new maternity class.

SECOND MODESTO SALE

90 Registered 90

Holsteins

MODESTO, CALIFORNIA

Thursday, Oct. 17, 1918

Including the entire dispersal of the C. G. Outland herd at Modesto, and splendid consignments from eleven other high-class herds.
There will be cows and heifers of show quality, high record cows and daughters of high record cows, bred to bulls from dams with records up to over 40 lbs. butter in 7 days and over 1100 lbs butter in one year.
A splendid opportunity to buy foundation animals at a time when it behooves every man to get all the registered Holsteins he can feed and handle, for there is every indication that demand is going to far exceed the supply in the immediate future.

Catalog in preparation. Write for one.

Urgent Need of More Sheep

[Written for Pacific Rural Press.]

The marked decrease in the number of sheep in proportion to population in California is receiving the serious attention of the local Food Administration. For while that department has no responsibility in connection with the wool supply, the matter of maintenance of an adequate amount of meat for our people at home, as well as our soldiers in the field, is so closely related to wool production that the administration feels it pertinent to urge greater production.

Statistics show that in 1880 there were 5.6 persons and 36.8 sheep per square mile in the State, averaging 6.6 sheep per capita. This year there are 20.2 persons and only 16 sheep per square mile, which is at the rate of only .7 sheep per capita. During the last ten years alone our population has increased 32 per cent while sheep have decreased 8 per cent.

The use of better blood in the range flocks is urged, not only that a higher wool clip may be secured but also a better mutton carcass, so as to get the greatest possible amount of product in the form of mutton and wool from the smallest number of sheep and the least amount of feed.

But we cannot depend upon the ranges to raise enough sheep for our needs. Each farm should have its flock, not simply from patriotic motives but because a small flock will pay better than almost any other kind of livestock on nearly every farm in the State.

On this account the movement recently inaugurated by the College of Agriculture to increase sheep production by a campaign for the establishment of a small flock on every farm should have the co-operation of all. In some sections the movement is being vigorously pushed. In Yolo county farmers have already agreed to purchase 1000 ewes, and it is expected that 2000 head will be placed on farms where none have heretofore been kept.

According to a plan worked out by Prof. Miller of the University Farm, the ewes are bred and sold for $10 per head. The lamb will sell for $6 and the wool from one clipping will net $4, thereby making full return on the investment in one year, and the farmer still has the ewe.

Here is an opportunity for true-blue American farmers to make a substantial investment and at the same time contribute to both the food of the country and the much-needed wool supply.

CATTLE SQUEEZERS FOR DEHORNING.

Do you have trouble keeping animals still while dehorning them or performing other operations?

The best contrivance we have seen for this purpose is a stall, called a squeezer, built for the purpose, on the Collins Bros.' dairy at San Leandro. Its sides slope from about three feet high toward center at the bottom, leaving only enough level space for the feet of the animal.

The feature of this squeezer is the heavy wooden V-shaped trough, without ends, which is swung around on hinges endwise to the stall in place of the stanchion, which is also on hinges.

The cow's head rests in the end of the trough and is fastened there by a rope which starts from a hook on one side of the trough, goes over her nose, then under a hook on the opposite side, then to a hook about a foot back on the same side, then across her head just in front of her horns to a windlass bar on the first side.

If the tightening of the rope by the windlass does not hold her head firmly enough, a 2x4 with the corners rounded and with a strap-iron hook at the end is hooked into a staple at the side of the cow's neck and brought down behind her head so that she can't possibly wiggle it.

CATTLE HOOKED INTO MANGERS.

Sometimes when cattle feed from an open manger one will be hooked into the manger on her back and will be badly injured. This was the experience of Collins Bros. of Alameda county in feeding about 300 head on chopped hay.

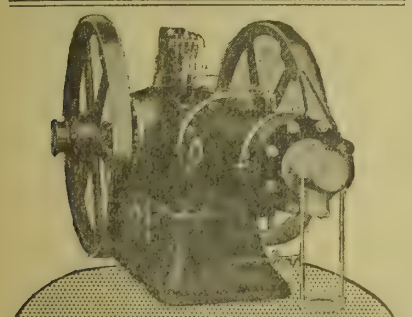
But they are off the worry wagon now, because they have put inch pipes from the front edge of the manger back to the top of the fence against which the manger is placed. These pipes are about two feet apart. They are valuable also in preventing the cattle from shoving the hay out and wasting it.

STOCKERS WANTED.

During the past ten days we have had several inquiries from farmers in the San Joaquin Valley for feeding cattle. Parties who have stock and no feed may get in touch with these men by sending us their addresses, stating the number and location of their herds.

The early maturity of Duroc pigs is sufficiently proven in the results obtained by one breeder, who marketed 99 head of March and April pigs on the 18th of the following January at an average weight of 297½ pounds. These were the culls from the spring crop, after several had been sold for breeders and others reserved for the herd. They were full-blooded Durocs, and had never been fed any slop. They merely ran on an eight-acre field of corn and rape, and were finished in a dry lot.

The N. H. Locke Co. sold a registered Jersey bull to R. G. Westfall of Colusa. The sale was made on the State Fair grounds on the day before the opening.



Muncie Oil Engine

10 to 100 H. P. It operates successfully on California Fuel Oil. Most Economical Engine Made.

Shotguns and Shotshells
for Shooting Right

GETTING the bulge on your year's work means a lot—a lot more if you love dog and gun. By getting yourself in trim with the *right* amount and kind of recreation, you will tackle next year's work with more vim.

There is much additional satisfaction in store for you if you buy a Remington UMC Pump Gun or Autoloading Shotgun for your days off this Fall. When your well earned chance comes to bag some game, you will then have in your hands a gun made to shoot *right*. Guns of the same design helped win the Grand Prize, highest of possible honors, "For Modern Firearms and Ammunition," awarded to Remington UMC at the San Francisco Exposition.

The wonderful Wetproof process invented for and exclusively used in the manufacture of Remington UMC Smokeless "Arrow" and "Nitro Club" Steel Lined Shotshells, has been pronounced the greatest advance in shotshell manufacture in a decade. *These shells as now made are the first completely wetproof shells.* Another Remington UMC contribution to shooting *right*.

In *black powder*, buy the old reliable Remington UMC "New Club," now Wetproof sealed at turnover and top wad.

First Impressions of the State Fair

[Written for Pacific Rural Press by R. H. Whitten.]

I hate to copy. It's lots more satisfactory to coin a new expression than to be obliged to use one that somebody else originated. But as I hurried around the grounds to get a general impression of the Big Event, I could think of nothing more fitting than the slogan of the fair recently held in Honolulu—"A war fair over here, to help the warfare over there."

For that's what it is—a war fair. And not only does it show what we can produce to help our boys fight their battles "over there"; but it also shows that we are capable of fighting our own battles here at home.

Probably there is not an exhibitor here who did not find it difficult to show. Probably every one, considering himself alone, would have preferred to remain at home. The scarcity of labor, the shortage of feed, and many other unusual conditions combined to make the ways of an exhibitor hard this year.

Yet every personal interest and inclination was subordinated to the high aims of patriotic duty and civic obligation. And that same indomitable American spirit which is blowing the Huns so high over on the battle front that the angels can hear them squeal manifested itself right here at home in giving us a fair that will put farming on a higher plane than it has ever occupied before.

Not so many exhibits, naturally, but quality, quality everwhere. And everything is being shown with a purpose, which is to encourage the raising of more and better products of every kind—to prove that the best pays the biggest.

In the livestock departments, for example, the judges are paying more attention than ever to utility qualities, and the fundamentals of meat, milk and wool production are the requisites that are governing the selections of animals for prizes. The utility standard is being made the show ring standard, and when an animal wins a blue ribbon it means that he will prove the best money-maker for the practical farmer.

Thrift is the watchword of all America today, and the show ring at the State Fair this year will do an inestimable amount of good in encouraging the use of better seed stock. The efficient meat and milk producing animals which are being shown will leave impressions on the mind of each spectator that will keep on working for weeks and months, and he won't be satisfied until he has some real money-making stock like that he saw.

He becomes interested in the exhibits of equipment, too — silos, cream separators, milking machines, churns, gasoline engines, tractors, water systems, disinfectants, litter carriers, etc. He sees farming in a new light and realizes not only the practical, money-making value of these things, but also their absolute necessity to meet the new conditions that confront him.

He comes here looking upon farming as a mere occupation—and full of drudgery at that. But after he has seen the results of scientific breeding and feeding, and of the use of labor-saving devices, he begins to realize that farming is a business—one worthy of the highest order of ability and effort, and one rich in financial reward if properly carried on.

So the blood begins to tingle in his veins again. His heart is fired with a new purpose, and he goes home determined to get his share of the money that is being made by scientific farming, and he does. For the man who keeps his purpose steadfast never fails.

Reducing the Cost of Beef Making

[Written for Pacific Rural Press.]

Feed lot practices in beef making are being revised to meet the rapidly rising cost of production. The wide-awake feeder is making every effort to get his business on a better paying basis, and consequently is turning to cheaper feeds and cheaper methods of feeding.

The Hollister Estate Company of Santa Barbara is in this class. They have several ranches, comprising 32,000 acres. They generally carry 3000 head of beef cattle, and can feed this number nine years out of ten. But the drought hit them this year and according to the old methods of feeding they could carry only 1000 head.

However, they determined to make themselves independent of weather conditions, and devise a new method of feeding that would enable them to carry 3000 head even in the dryest years, knowing that if they had a surplus of feed during favorable years they could easily buy extra feeders.

So they are having the National Tank and Pipe Co. erect eight cyclone silos, each 20x40, and two 20,000-gallon water tanks. The work is in charge of F. J. Oberer of the National Co., who states that several different tests will be made to determine the value of different feeds and combinations.

On one ranch, where there is a shortage of alfalfa, four silos will be filled with bean straw and corn. On another ranch, where conditions make it necessary to raise corn with beans for a windbreak, two silos will be filled with bean straw, honey sorghum and sweet corn. One silo will be filled with bean straw and the last cutting of alfalfa and one with bean straw alone.

The tests will be conducted in a scientific way. The stock will be weighed at the start, and a careful record will be kept of the amounts of the different kinds of feeds used, and the gains made. At first the contents of the different silos will be fed alone; then hay will be added as seems necessary, until a ration is found which makes satisfactory gains and still allows a liberal use of these roughages.

The results will be given in these columns. Watch for them. The expense of the tests, including cost of silos, will amount to about $20,000, yet you can have the benefit of them without a cent's expense to you.

K. W. Abbott, formerly of Milpitas but now in the U. S. Army, has transferred his Holsteins to Gotshall & Magruder, of Ripon, who have just finished testing Creamcup Vogelschen Cornucopia 180311, a daughter of their herd bull, Colantha Sir Pontiac Aaggie. She made a record of 35.18 lbs. butter and 342.2 lbs. milk under adverse conditions, as she freshened three weeks before her time.

The largest single order for bacon and canned meats in the history of the world, 99,560,000 pounds of bacon and 134,000,000 pounds of canned meat, was placed by the Quartermaster's Department, U. S. A., for the American army overseas in July. Louis F. Swift, in commenting on this, said that the order will take the bacon from approximately 1,900,000 hogs. Six months will elapse before delivery is to be completed.

The second case of cattle stealing brought to the attention of the State Cattle Protective Board has resulted in a conviction. C. W. Camp of Laton was given an indeterminate sentence of not less than one year in the penitentiary at San Quentin. Camp was accused of stealing cattle from several stock owners in Fresno county, and in one case shipped nearly a carload of stolen cattle to a slaughterer in Los Angeles. The board is elated over the success it has had in administering the new law for the protection of stock owners in this State.

A 16 Year Boy and an Empire Will Replace 3 Men at Milking

NEVER before in the history of America has the farmer been so short of hired help. And never before has the clamor of America and her allies been greater for bigger crops. We must have them. They are vital to the winning of the war.

But the farmer must have help or he can't give us big crops. Congressional investigations don't put men in the fields. A "selective" draft for farm help is out of the question. The only solution is the adoption of mechanical equipment to supplant human endeavor to the greatest possible degree.

EMPIRE
MILKING MACHINES

Add hours each day to the field time of every man on your farm. A 16-year-old boy with an Empire Milking Machine will replace three men at milking twice a day. He can milk a herd of 25 cows, such as is shown above, better and faster. And it won't be drudgery for him either. He'll enjoy his task, for every boy likes to run machinery. If you haven't the boy, a girl can run the Empire just as well.

For the Empire is the simplest, easiest operated of all milking machines. Its Super-Simple Pistonless Pulsator causes an absolutely uniform action in the teat cups at all times. There is no loss of vacuum from wearing pistons. Teat cups stay on perfectly, regardless of teat sizes. No surcingles or harness are required. A boy or girl can apply Empire teat cups to the cow easily and quickly because with Empire positive and uniform vacuum, teat cups take hold instantly, and it is not necessary to use different sized cups for different cows.

Hard milkers do not "stump" the boy or girl with an Empire. The Empire milks them all. In fact, cows like it better than hand milking. They usually show this by increased milk flow. The continuous, uniform action of Empire machines soothes and quiets the cow.

Thousands of boys and girls with Empires are replacing from two to three times as many men. Why not on your farm? It's worth investigating. Get our Catalog No. 45. Ask for name of nearest dealer. Get a demonstration. No obligation. Look into the matter now.

Live Stock and Dairy Notes

Livestock breeders all over the State are invited to send, on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.

The Dairy.

L. D. Thompson of Modesto has a Holstein cow, Dora Hengerveld of Silven Iris, that made a record of 23.06 pounds last week.

Thos. Harrison of Glen Ellen has sold Glen Monarch, an 11-months-old milking Shorthorn bull, to Howard Dunsmore of Victoria, B. C., who is just starting a herd of milking Shorthorns. Mr. Dunsmore is one of the largest stockholders of the Canadian Pacific R. R.

Owl of Belleview, the bull that heads the Jersey herd at the University Farm, now has seven daughters in the Register of Merit, as Catalina of Venadera and Blanda of Venadera, in the herd of Guy H. Miller of Modesto, have recently qualified.

Fairmont Echo Alcartra, the famous Holstein heifer, bought at last winter's Sacramento sale by J. W. Benoit of Modesto, has dropped twin calves that look very promising. Mr. Benoit has a very fine cow in Vera Walhalla Princess. She will soon be fresh and is expected to make a good record.

F. W. Elleby of Modesto has a fine herd of registered Jerseys and finds the demand for bulls very good. He has just sold the last two old enough for service, Prince Eminent Polo going to C. D. von Konynemburg, and Queen Modesto Chief to Harry S. Coey, both of Modesto.

Big doings are promised at Hidden Valley Ranch, Redwood City, this fall and winter. A. J. Welch, the owner, has placed the Guernsey herd in charge of R. S. Adams, who is starting out determined to make some changes in the association record books. He has thirteen head that averaged 54 pounds of butter fat last month, and four of them were two-year-old heifers.

Dominita Bonnie De Kol, in the herd of S. G. Kounias of Modesto, recently completed an official test of 20.97 pounds butter with an average test of 5.72 per cent. The first milking after the test began was 8.6 per cent fat, the second 9, the third 7.9, and every milking went over 4 per cent. The Dominita strain is noted for high testing and is proof that this quality can be bred into cows.

Swine and Swinemen.

J. H. Hansbrough of Modesto, whose Poland-China boar won the grand championship last year, is at the State Fair again this year with a fine lot of hogs.

Dixson & Dixson of Hughson have made a large number of sales recently, but reserved enough Durocs to make a fine showing at the State Fair this week.

W. P. Andrews of Modesto has his Durocs in fine shape and is greatly disappointed because scarcity of help will prevent him from showing them this year.

H. I. Marsh of Modesto has twelve Poland-Chinas that will weigh 800 pounds or better, and quality is not lacking either. He recntly sold a corking good gilt to J. H. Kendall of Modesto.

F. A. Brush of Santa Rosa received an order for a Berkshire sow from the Kamehameha School of Honolulu; also for two sows from Guayaquil, Ecuador, and for one sow from Rio de Janeiro.

R. J. Ross of Modesto has a Duroc boar called Good Enuf 101, that is well named, for he is good enough to head the best herd in the land. Mr. Ross reports a heavy demand for Durocs, and has made sales recently to I. E. Lightner, Henry Trez, Mrs. Perry, J. W. Simmons.

Anchorage Farm, Orland, converted many skeptical farmers to the money-making value of purebred Berkshires by placing 34 pigs among the pig club members of Sutter county. Reports were received showing that pigs gained 10 and 12 pounds per week, making about double the gains of ordinary stock and about one-half the cost. Blood will tell.

J. F. O'Connor, manager of Castleview Ranch, Santa Rosa, reports sales of Berkshires as follows: sow to Sheridan Peterson, Windsor; boar to W. H. Davis, Santa Rosa; bred sow to Mrs. Turner, Sebastopol; boar to P. T. Vander Straten, Dunken Mills. Mr. O'Connor guarantees satisfaction, ships on approval, and pays express charges in case of dissatisfaction. That's the way to build a permanent business.

The Sandercock Land Company has an exhibit of fifteen Berkshire hogs at the State Fair from its Natomario Ranch, that is a record breaker. The famous sow, Riverby Princess III, is there, weighing 650 pounds, and with her are six of her pigs, one year old, averaging 426 pounds each. The sire of these pigs, Winona Lee Champion VI, was first prize junior yearling last year, and now weighs 800 pounds. Other exhibits of special interest are Princess Leader, the only Berkshire in the world whose parents on both sides are world champions, and two pigs whose sire and dam were national grand champions.

Beef Cattle.

There will probably come before the legislature at its next session a bill requiring the use of purebred beef bulls on the open ranges.

J. H. Rossiter, owner of Wickiup Ranch, at Santa Rosa, is very well pleased at the way his Shorthorns are coming along. He expects to have a 100 per cent calf crop.

C. B. McClure of Clearwater, near Los Angeles, buys beet tops to feed to steers. He pays for them on the basis of 25 cents per ton of beets harvested and finds them very profitable feed.

Supt. C. M. Barney of the H. J. Knowles ranch, near Monticello, fattens cattle on a chopped mixture of alfalfa, barley, and oat straw. Wheat straw, he says, does not make good feed.

Clinch & Peters of Chico and Quincy aim to have their purebred Hereford and Shorthorn calves come a month before good green feed is ready. Thus they are ready to take the heavy milk flow when it comes with green feed.

Sheep.

The Blackhawk Ranch at Diablo now has 100 head of registered Shropshires. They represent some of the best blood lines of the breed and are a fine lot.

Mrs. F. A. Mecham of Petaluma, manager of the F. A. Mecham estate, is in Utah, attending the ram sale at Salt Lake. She expects to bring back some fine ewes.

The entire capacity of all Pacific Coast woolen mills will hereafter be used in turning out blankets for the Government. Orders have been issued directing mills to discontinue manufacturing Navajo and other fancy blankets.

Bishop Bros. of San Ramon have been selling Shropshire rams like hot cakes this season. They have disposed of all surplus stock and are now turning down orders. Pretty good proof that it pays to establish a reputation for your flock.

Stanislaus county farmers have appointed a committee to co-operate with the U. S. Department of

Long Life and a Useful One

are facts about REDWOOD TANKS, that are proved in every kind of variable climate. Then there is the fact that Redwood resists corrosion; is immune to insects, and delivers water pure, sweet and free from disagreeable tastes or odor.

One of Our Customers Writes

us as follows from Costa Rica: "We have been using several Redwood Tanks, of your make, for some years, and we can state that we have always found them just what we desired, and satisfactory in every detail."

This is but one testimonial selected at random from our files. Positive proof that our Redwood Tanks in actual use bear us out in our claims.

Agriculture in increasing sheep production. It is estimated that five times the present number of sheep can be kept in this county with profit to everyone who goes into the industry intelligently.

Livestock Miscellaneous.

We learn that D. O. Lively has been sent to Archangel, Russia, in the capacity of a captain in the American Red Cross work.

Efforts are being made to induce Secretary Lane to allow sheep to graze in the Sequoia and Yosemite National Parks, but it is claimed that sheep may injure the trees and shrubbery.

Dairymen understand more and more the necessity of quality in their stock rather than numbers, for it is not always the dairyman who has the biggest herd who makes the most money.

Supt. C. M. Barney of the H. J. Knowles ranch near Monticello, fattens cattle on a chopped mixture of alfalfa, barley, and oat straw. Wheat straw, he says, does not make good feed.

Several of California's most prominent breeders has gone in for Hampshires, starting with the very best stock obtainable. They report a heavy demand for stock and great interest in the breed.

Six years ago there were 350,000,000 acres of public range for livestock in fourteen Western States. This has been cut to 250,000,000 acres, which is still bigger than Germany and Austria put together.

The profitableness of raising stock in Lassen and Modoc counties has materially checked the extension of the wheat acreage. Stock requires but little farm labor, and the land owners have followed the lines of least resistance.

To insure them a 120 per cent lamb yield the Dangberg Co. of Minden, Nev., built one of the most extensive and complete lambing sheds we have ever seen. Ten thousand ewes can be taken care of in the sixty-day lambing period.

It is said that a surprising feature of the sudden boom in the sale of horses following the war was the decline rather than increase in the market price. The price now seems to have hit a level and is commencing to climb slowly, they say.

Bryan & Bernard used two registered Hereford bulls on their herd for two years, and were so well pleased with the results that last spring they bought ten registered heifers and three more bulls in order to raise purebreds for their mountain ranges.

Miller & Lux are breeding every available mare of breeding age, as they expect horses and mules to increase greatly in value. They are breeding 2500 mares—1800 of them to 32 stallions and 700 to 16 jacks. They are establishing a stud of Percherons and will raise their own sires hereafter.

Large numbers of horses are being gathered at the army camps in various parts of the United States and they require heavy shipments of hay from primary points to the larger marketing centers. Many of these horses will be shipped abroad, and hay as well as more concentrated feed must follow.

California packers were recently notified by the Food Administration that they were not living up to their agreement to pay 1c per pound under the Chicago prices for hogs, as the difference at the time was 3c. An increase in the price to producers is expected to result.

On account of the scarcity of labor the Black Hawk Ranch at Diablo will not show any more horses until the war is over. Too bad to keep so many champions at home, but they will be heard from again later on. Also there are a number of fine colts that are destined to become prize winners.

The Compania Swift de Montevideo, the Uruguayan subsidiary of Swift & Co., Chicago, recently bought from the United States eleven boars and two sows, all pedigreed animals of Berkshire and Poland-China breeds. In order to encourage hog raising in Uruguay the company is offering the hogs to stock raisers at cost price.

J. H. Rossiter, owner of the Wickiup ranch at Santa Rosa, has recently purchased the noted stallion, Friar Rock, from John E. Madden of Lexington, Ky., for $60,000. Sixteen mares were included in the purchase at $40,000 additional. Shipment will be made about the first of November. This makes Mr. Rossiter's stable the finest in the West, with the famous old stallion, Desquise, at its head.

Fred H. Bixby of Long Beach, owner of seven large California ranches, says that a large number of the horse breeding companies have gone out of business, but he considers the future bright and expects the horse breeding business to be in a flourishing condition within a year or two. He says that they have no trouble in disposing of all their big horses and mules, but that horses weighing from 1200 to 1400 pounds and mules under 1000 pounds are poor sellers.

MULE FOOT HOGS, large type; booking orders for spring litters. These are the farmers' easy feeding, profit-producing kind. Meet me at the Fair. H. T. Bailey, Box 37, Lodi, California. "The Blue Gums"

Poultry for Profit

[Written for Pacific Rural Press by Susan Swaysgood, Pomona.]

FEEDING AND PLANNING FOR FALL EGGS.

Early hatched pullets ought to be reddening up by this, no matter what breed they are. Leghorns should be laying, but from what I notice in my rambles around a good many are not. There is something lacking when Leghorns do not lay at five months old, when the season is right. So anybody with March-hatched chicks that are not laying or showing good evidence of doing so had better look up the treatment the pullets are getting, for most likely the fault will be found in a lack of some element needed. Sometimes pullets will make comb and redden up and yet not lay, and the lack of eggs may be solely due to a need for animal food.

FEEDING FOR EGGS.

A good pan of sour milk a day, or a hopper with a good quality of beef scraps where they can reach it will settle the question. Milk is easier on the liver than beef scraps, besides it gives more shell material along with the animal food and it's a sort of green feed combined, so that it answers several needs that beef scraps do not reach. Where there is plenty of milk there should be plenty of eggs. If it proves too laxative, just set it over the stove a day or two and clabber it, but don't clabber in the sun. The flies get in it and make the milk filthy; when clabbered over the stove it is clean and fit to use. Bone and shell and good sharp grit are also needed by pullets beginning to lay, and by molting hens, too. In fact, nothing helps the molt along better than a good supply of these feather-making feeds.

PROVIDE CLEAN NESTS.

Another thing that will encourage the pullets to commence business is to prepare some nice, clean nests for them, in a retired part of the house; never under the dropping boards, for mites are sure to make their home, sooner or later, in the nests under dropping boards. The least little neglect and these pests are attracted to the nests. Then, if a sitter or two happens to be left on a nest over night, the mites feed on them and in many cases kill them.

WORK FOR SEPTEMBER.

September is a month that the poultryman should begin to get returns from his labors in; it's the month of Jewish holidays, when ducks and geese bring good prices, and as these fowls are big eaters the average feeder is anxious to dispose of them as soon as possible. Any of the commission men will send you dates of Jewish holidays, then you can fatten and sell at the right time. Unless a person has a good pasturage or plenty of vegetables, ducks soon eat their heads off at this time of year. It's much better to sell than to keep many breeders over. Where there is pasture, stock ducks and geese can be turned out to rustle until towards Christmas. They should not be allowed to eat up grain that can serve better purposes. It is not always economy to sell breeding stock too close, but we have to do some things a little out of the usual to economize in grain now, and everything that can live on grass should be made to do so. Boiled or raw vegetables, with the very least amount of other feed, will feed stock ducks until laying season commences.

OODLES OF EGGS.

Last year there was an item published in the Press telling about a large poultry plant near Tulare that was getting oodles of eggs from a ration of barley and sour milk. The grain was soaked in the milk and fed after a night's steeping. Now, that is an economical method of feeding and is a saver of time and high-priced feed, besides being a healthy feed and a good egg producer. Standing in the milk, the grain would in the course of a night absorb a good deal of the best part of the milk, then by draining off the whey and feeding the solid contents of the milk with the barley the hens were consuming a balanced ration with the least effort, and that counts, for unless Leghorn hens are to be used for breeding purposes it's just as well to economize in effort.

TO CURE EGG-EATING HENS.

To the Editor: How can I prevent my hens from eating their eggs? They have plenty of good feed and shells. They are all good layers and I don't like to kill or sell them.—Mrs. E. B. J., Selma.

[Cut the point of the upper bill off with a sharp penknife or razor even with the lower bill. It will bleed a little and be sore, but by the time it gets well your hens will have forgotten all about eating eggs. This is the only sure cure I know of.]

BUY IN GRAIN FOR THE WINTER.

Milo maize and gyp corn will be coming on the market next month and the man who has cash should look up some farmer who has corn and save the middleman's fee. Economy must be practiced along all lines, and this is true economy. Barley has been kept off the market, but I have heard of private individuals buying enough to last them through the winter at a much less price than it is selling for now, so you see it's well to be forehanded in these things.

Why Hens Won't Lay

P. J. Kelly, the Minnesota Poultry Expert, 88 Kelly Bldg., Minneapolis, Minn., has published a book, "The Tale of a Lazy Hen." It tells why the hens won't lay and how to make them lay every day. Mr. Kelly will mail the book free to anyone who will write him.

Chickens Must Lay

when they are fed according to NATURE. This means balanced rations. COPRO not only makes better layers but reduces the cost of feeding as well.

Copro

contains 16.4% Protein, practically all digestible. It is likewise high in percentage of fats.

Laying hens are profitable. Balance their rations with COPRO and watch the RESULTS.

FREE SAMPLE and a copy of our booklet containing valuable information on the subject of "Successful Feeding" gladly sent on request. Write today.

Mothers of Boys Should Know

That Boss of the Road Overalls are built to stand the hardest knocks of work and play. Genuine, indigo-blue denim that takes the tub test and comes up smiling; "stay-there" seams that can't rip out; big, man-like, *swinging pockets;* hold-fast, patent buttons; reinforced strain points—all the features that make Dad swear by *his* Boss of the Road Overalls.

All of which explains why, in these thrifty times, it is good economy to buy Boss of the Road Overalls.

If you don't know what we mean by *swinging* pockets—your dealer will gladly show you.

Look for the Bull Dog on the label. It is your protection. Never has this trade mark meant so much to you as it does today.

NEUSTADTER BROS.

San Francisco Portland

FARMERS SHOULD SHOW PUREBRED UTILITY FOWLS.

As a war-time patriotic feature the managers of the San Francisco Poultry Association have planned to make it particularly interesting and profitable for those who have only recently taken up the keeping of purebred fowls for practical (or utility) purposes, if they place a small exhibit of young or mature fowls in its annual show to be held in conjunction with the Livestock Show in San Francisco, November 2-10. George H. Croley, secretary of the Poultry Division, at 525 Market street, states that few farmers are able to have their fowls judged and mated by experts, and this opportunity should be eagerly grasped by those who wish to breed their fowls for profit, uniformity, and good looks. The exhibition is to be a combined Standard and Utility show; the fowls will be passed upon by Standard judges, who examine them only to find which are best in shape, color, etc.; they are then rated by a Utility judge, using the Hogan method, and a score-card is issued showing their qualifications for egg production, table qualities, or desirable breeding purposes. Nearly all farmers now understand that only Standard, or purebred fowls, can be made to produce satisfactory results from the standpoint of profit, but many do not realize how necessary it is to select those that possess certain Utility qualifications. This is a rare opportunity for farmers. By selecting a few fowls that he thinks are his best breeders and entering them to be judged by an expert, he may gain knowledge that will enable him to obtain increased profit and satisfaction from his flock.

HOME CIRCLE

PRAYER.

God, though this life is but a wraith,
Although we know not what we use,
Although we grope with little faith,
Give me the heart to fight—and lose.

Ever insurgent let me be,
Make me more daring than devout;
From sleek contentment keep me free,
And fill me with a buoyant doubt.

Open my eyes to visions girt
With beauty, and with wonder lit—
But let me always see the dirt,
And all that spawn and die in it.

Open my ears to music; let
Me thrill with spring's first flutes and drums—
But never let me dare forget
The bitter ballads of the slums.

From compromise and things half-done,
Keep me, with stern and stubborn pride;
And when, at last, the fight is won,
God, keep me still unsatisfied.

THE BROWNIE HOUSEBOY.

"It's a pity there isn't a brownie in our cellar to drink that," said mother, as Harold rose from the supper table, leaving his glass half full of milk.

"Do brownies like milk, mother?"

"I have always heard they do," said the mother. "All the stories about them say that if you'll put a saucer of milk on the cellar floor every night a brownie will come and live there and help to do the housework."

"Help do the housework!" cried Harold.

"Yes. He'll make the kitchen fire and put on the kettle, and have things cosy and nice before it's time to get breakfast. He has to get up very early, because it would not do for him to let people see him."

"Is it really true?" asked Harold, his eyes round with wonder.

"No, Harold. I wish it were. Then I'd put this milk in the cellar and get a brownie to come and bring in all that wood that father cut," said mother, as she left the room.

"Maybe there really are brownies," thought Harold, "and mother just thinks there aren't because she never saw one. I believe I'll put this milk in the cellar and see if I can't catch one. Won't mother be surprised if she wakes up in the morning and finds the work done in the kitchen!"

So he crept out into the hall and down the stairs into the dark cellar. It was a good thing he was such a brave boy, or he couldn't have done it.

It might have been the newness of keeping a secret from his mother, or it might have been the excitement of catching a brownie; but something woke Harold the next morning long before his usual time.

He saw the faint daylight through the shutters and heard his mother's gentle breathing, and it seemed strange to be awake all by himself.

"I wonder if the brownie has come," he thought, and then he slipped out of his little bed and into his clothes as well as he could. He knew mother would not like him to go out of the room undressed.

It was still so dark in the cellar that he had to put his finger into the saucer to find out whether the brownie had drunk the milk.

Yes, it was gone: the saucer was quite dry. Upstairs flew Harold and into the kitchen. But disappointment met him there. Everything was just as it had been left at night.

"The mean old brownie!" thought Harold. "So selfish, drinking the milk and then going away without doing his work."

He wouldn't have any surprise for mother after all. Then a quick thought came to him. Suppose he did the brownie's work himself! She would be just as surprised to find it done.

He couldn't light the fire, because mother did not allow him to touch matches, and he stood a moment thinking what he could do.

Why, bring in the wood, of course! And out he hurried, toboggan cap on his head and coal bucket in his hand, to begin the job. It was surprising how much fun there was in carrying in load after load and piling it into the wood-box. He had just finished and was sweeping up the dirt he had made when he heard his mother coming and calling him.

Harold ran through the outer door into her room, pulled off his shoes and jumped into bed, clothes and all.

"Ma'am!" he answered, when he was safely in.

"Why, Harold," said his mother, coming back, "where were you when I got up just now? And what are you doing with your clothes on?" she added in surprise.

"Mother," said Harold, "it's a secret I'm having. Won't you please let me have it for a secret?"

"I will this time," said his mother. "But you mustn't get up so early again. Little boys need lots of sleep so they can grow big and strong, and they mustn't get up till their mothers tell them to."

When they opened the kitchen door, Harold watched his mother's face as she caught sight of the wood-box, and laughed when he saw how astonished she looked.

"Who in the world did this?" she exclaimed. "Harold, did you put milk in the cellar and bring a brownie?"

"Yes, ma'am, I did; but he was a horrid, greedy brownie. He drank up the milk and didn't do his work either!"

"Then who did all this work?"

"Oh, a kind of a brownie, but not a real one;" replied Harold. "I 'spect he'll do things for you every day if you don't look."

"Well, that will be nice," said his mother, "to have a brownie houseboy. Only he mustn't try to do things too early in the morning."

"Maybe that's the reason brownies are so little," said Harold. "They get up so early that they don't get enough sleep and stop growin'. Mother, do you think it was a brownie that drank that milk?"

"Don't ask me. Ask another member of the family," replied mother.

"But there isn't anybody else 'cept father and little sister, and little sister can't talk."

"Neither can the member of the family I mean," said his mother, smiling.

"Oh, who is it? Please tell me, mother."

"Listen!" said his mother. "There she is now."

Harold listened.

"Me-ow," came a voice at the kitchen door. "Me-ow—me-ow."—Annie F. Maclean in National Daily Review.

MAPLE FROSTING.

Here is the rule for making a maple frosting that calls for no cane sugar at all. Boil a cup of water, add a cup of maple sugar and an eighth of a teaspoon of cream of tartar until it spins a thread.

Have ready a white of an egg beaten stiff and pour the sugar on the egg a little at a time, beating it in constantly till all the syrup is taken. Continue beating for a few minutes if it is not yet thick enough to spread. Maple syrup can be boiled to the threading stage and hence used instead of the maple sugar.

A maple frosting of this sort may be used for practically every sort of cake. With the addition of nut meats, either whole or broken, it is especially good. It is good used plain on a chocolate layer cake, or it may be made more interesting by sprinkling grated coconut over it.

Very good cakes can be made without any sugar whatever by the substitution of corn syrup. Such a cake made in layers may be held together by means of a fruit jam of your own making, or you may use a filling made from chopped dates or figs cooked with just enough sugar to hold them together. A cake of that sort needs no top icing, especially if it is eaten fresh.

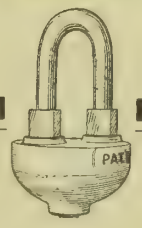
Thriftward Fuel-Wisdom



Your trip to the Tractor Show is a splendid opportunity to personally investigate and learn of the true merits of that little wonder called "The Simplest Thing in the World"—the Premier Burner.

The trip will serve a double purpose in that you will have positive assurance and personal knowledge of its perfection and working ability as directed to fuel thrift and comfort in the home.

You will see it working in a stove like yours at home—the inside of the burner—and fully understand why it always works—why no repair or replacement is necessary, and why no smoke, soot or fumes.

Before you do anything else, visit the home of the burner down on Spring Street.

FOR ANY STOVE WITHOUT CHANGES. PREPAID ANYWHERE, $5.00, WITH UNLIMITED GUARANTEE.

New Circular "B" for the asking.

LOS ANGELES

Agricultural Summary

Our Pre-eminence in Livestock.

The loading reports of the Bureau of Markets for the first seven months of 1918 show that of all cars of livestock loaded for the four leading Pacific Coast cities 41.7 per cent were destined to San Francisco, 24.3 per cent to Los Angeles, 19.3 per cent to Portland and 14.7 per cent to Seattle. San Francisco not only led in the total number of cars loaded, but with the exception of horses and mules also was first in all classes of livestock. Horses and mules were loaded in greatest number to Los Angeles, which received 44.4 per cent of the total number of cars consigned to the four Coast cities named. The largest number of cars of mixed stock were destined to Portland, which received 75.3 per cent of the total. Aside from these two exceptions, the four cities maintained the same relative positions throughout, with San Francisco first, Los Angeles second, Portland third and Seattle fourth.

Gasoline Displaces Hay.

The San Francisco trade in hay has been unusually light this season owing to the large displacement of horses by motor equipment in the delivery departments of large stores and in the heavy trucking lines. The country demand, however, is acute. Edw. O. Amundsen, County Agent, U. S. Department of Agriculture, says regarding the hay situation: "There is not the slightest doubt that hay of all kinds will be high in price during the coming winter. In fact, prices are already away up and promise to continue soaring. The Federal Food Commissioner may be able to check any excessive price boosting and so afford some relief to hay consumers, but as the supply will be limited the price will hardly be lower and will very probably be higher than at present."

Strawberries Double in Four Years.

California's strawberry growers are sharing in the general uplift of prices of farm products. The following are the average prices obtained for strawberries per crate for the past four years:

Season—	Average price
1915, without inspection	$0.90
1916, first year inspection	1.13
1917, second year inspection	1.30
1918, third year inspection	1.80

When our jam industry has developed, all the over-ripe fruit can be used to good advantage, as it is in other countries.

How One Ally Buys Wool.

The New Zealand Government proposes to purchase the New Zealand wool clip for this season and until one year after the close of hostilities at the same prices as were paid during the past two seasons. The payment for the wool is to be made by the British Government on the fourteenth day after valuation has been made by the official valuers in this country, and all shipping expenses are to be borne by the British Government thereafter.

Potato Men Optimistic.

There appears to be considerable speculation among growers and dealers of potatoes as to the price this favorite vegetable will bring the coming winter. While potatoes sold during the summer down to $1.50 per cwt., the current report is that growers are holding for about $3, and the forecast among the wise ones is that they will go much higher before the next crop is harvested. This season's crop is somewhat below normal, but ample for all local demands.

Walnut Prospects Good.

California's walnut crop this year is prophesied to be a bumper, likewise the price to be paid therefor. Weather conditions have turned out more favorable than anticipated and the size of the crop and of the individual nuts composing the crop invite frequent use of the word "Jumbo" in descriptive parlance.

THE MARKET REPORTS

Figures Given are Independent and Reliable.
Prices Quoted as Paid to Producers.

SAN FRANCISCO

San Francisco, September 4, 1918.

WHEAT.

Wheat is selling at the prices announced by the Federal Grain Corporation, and these prices will doubtless be maintained for the present crop. The prices quoted are for grain f. o. b. San Francisco, Los Angeles, Seattle, Tacoma and Portland, and guaranteed at least $2 per bushel f. o. b. shipping point. The price of sacks and sacking not included.

No. 1 hard	$2.20
No. 2	2.17
No. 3	2.13
No. 1 soft	2.18
No. 2	2.15
No. 3	2.11
Club or Sonora, No. 1	2.16
do, No. 2	2.13
do, No. 2	2.09

BARLEY.

The barley market continues unchanged. There is some talk on the street that the Government may decide to fix the price of barley, as it has wheat, in order to protect the farmer.

Choice feed, per ctl	$2.40@2.47½

OATS.

There has been some inquiry this week for seed, but no sales are reported.

Red feed, per ctl	$2.50@2.65
Red seed	2.[illegible]@3.25

CORN.

A small shipment of corn arrived in San Francisco from the East, but no sales were reported to change the nominal quotations of the past few weeks. (First-hand prices on strictly first-class grain, San Francisco.)

California sacked	$4.20@4.25
Milo maize	3.95@4.05
Egyptian	4.05@4.10

HAY.

Receipts of hay for the past week were 1792 tons, compared with 2067 of the previous week. As has been the case for some weeks past, a good portion of this hay arrived by water and much of it was alfalfa. Although these shipments are not heavy for the month of August, the market is well stocked and has been for some time past. Prices have been fairly well maintained throughout the week. The Government was in the market for some export hay.

Wheat, No. 1	$23.00@25.00
do, No. 2	20.00@22.00
Choice tame oat	24.00@26.00
Wild oat, new	19.00@23.00

Alfalfa, first cutting	16.00@20.00
do, second cutting	22.00@24.00
Stock	18.00@21.00
Barley straw	50@80c

FEEDSTUFFS.

There were no changes in prices of feedstuffs during the week. The market is fairly steady, and the demand may be said to be normal.

New alfalfa meal, per ton	$33.00@34.00
Coconut cake or meal	44.50
Cracked corn	86.00@88.00
Oilcake	$75.00@76.00
Rolled barley	52.00@52.50
Rolled oats	58.00@60.00
Bran, carload lots in S. F.	23.75
Mixed feed, do, do	25.00
Middlings, do, do	25.75

POTATOES, ONIONS, ETC.

Onions were stronger and higher this week on a good demand. The quotation of potatoes was not changed and while the market is strong no material changes are looked for until after the first rains.

Tomatoes are coming in in much better shape since the Federal and State authorities have interested themselves in the more uniform packing of this vegetable. Prices are lower. The vegetable market as a whole is quiet, with comparatively small receipts.

Peas	6@8c
String beans, per lb	4@5c
Wax beans, per lb	4@5c
Carrots, per sack	75@85c
Rhubarb, San Jose, per box	$1.00

Whites	$2.35@2.60
Sweets, per lb	4¼@4½c
Onions—	
River Reds	None
Yellows	$1.65@1.90
Australian Browns	1.65@1.90
Garlic, new	16c
Green corn, Alameda, per sack	$2.50@3.00
Okra	5@7c

BEANS.

The bean market continues to show weakness, with little demand. Prices were lowered on several descriptions in order to stimulate the market. However, very little interest was manifested by buyers even at the lower quotations.

Bayos, per ctl	$ 7.40@ 7.50
Blackeyes	6.60@ 6.75
Cranberry beans	10.25@10.50
Limas (south, recleaned)	12.50@12.75
Pinks	6.75@ 7.00
Red kidneys	Nominal
Mexican Reds	7.25@ 7.40
Tepary beans	7.50@ 8.50
Garbanzos	8.00@ 8.75

POULTRY.

The whole poultry market continues firm, with higher prices on several descriptions. Extra hens and small broilers were in especial demand. Ducks and geese also showed an advance on good demand. The receipts were below normal for the week.

Turkeys, live, young spring, lb	38@40c
do, old	30@32c
do, dressed, old	32@34c
Broilers, 1½ to 2 lbs	38@40c
do, 1¼ lbs	42@45c
do, ¾ to 1¼ lbs	47c

Squabs, per lb.	45c
Ducks	27@30c
do, old	24@25c
Belgian hares (live)	18c
do, dressed	19@23c

BUTTER.

The butter market was firm throughout the week, with small daily fluctuations. Prime firsts jumped a cent and a half on Wednesday on more extensive trading, while firsts were entirely neglected and no sales reported. Butter was remarkably steady throughout the month of August, just closed. The highest price for extra on the Exchange was 53½c and the lowest 51½c, a range of only 2c for the month. Prime firsts had a range of only 1½c, from 49c to 51½c, during the same period, and firsts were unchanged throughout the month at 49c.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extra	52½	52½	53	—	53½	53½
Prime 1st	50½	50½	50½	—	50½	52
Firsts	49	49	49	—	49	Nom.

EGGS.

Eggs were strong this week and closed for extras at 64c, with extra pullets at 62c. At these prices very few can be shipped into the Eastern market, as the differential is not sufficient to make such shipments profitable. Some eggs are being shipped into this market from Kansas and Nebraska and these eggs have been sold at times 10c below the Exchange quotations. They found ready sale among the consumers at the prices asked. Eggs showed an advance of 13½c for extras during August and 12½c for pullets. These advances are far greater than during the same period last year.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	61	62	62	—	63	64
Extra 1sts			Nominal			
Firsts	46	46	46	46	46	Nom.
Extra pullets	57½	59	59½	—	60½	62

CHEESE.

While the price of the various descriptions of cheese receded after the close last week, it became stronger as the week progressed and closed with California cheese unchanged from last week's quotations. All the Oregon descriptions were stronger. All descriptions of cheese show a marked advance in price since the first of August, except California Y. A. fancy.

Fancy California flats, per lb.	32c
First California flats, per lb	Nom
California Y. A. fancy	30c
Orgon triplets, fancy	31½c
Oregon Y. A. fancy	30½c
C. S. Oregon triplets fancy	30½c
do, Oregon Y. A. fancy	28½c
do, Long Horn fancy	29c
Monterey cheese	23@25c

FRESH FRUITS.

Little fresh fruits arrived on the market this morning. The second crop of raspberries is now coming in and the fruit is in fine condition. For the best the highest price of the season is now being secured. Cantaloupes are of better quality and the receipts are falling off. As a consequence prices are higher. Isabella grapes are becoming plentiful and sell for the same price as Tokays.

Apples	$1.50@2.50
Apricots, per crate	Nominal
Peaches, 4-box crate	.75@1.00
Figs, black, per box	None
do, double layer	$1.00@1.50
do, Single Row Whites	.65@75c
Strawberries, per chest	7.00@8.00
Blackberries, per chest	6.00@7.00
Raspberries, per chest	12.00@15.00
Loganberries, per chest	None
Plums	$1.00@1.50
Cantaloupes, flats	.60@75c
do, ponies	$1.25@1.50
do, standard	1.50@1.75
Watermelons, per lb	1½@1¾c
Pears, Bartlett, per box	$1.50@2.25
Grapes, seedless	$1.00
do, Malaga	1.25
do, Fountainbleu	.90@1.00
do, Tokay	1.25@1.50
do, Isabella	1.35@1.50

CITRUS FRUITS.

The citrus market remains unchanged. The street feels that prices are already as high as the public will stand, but no excessive receipts have come in to justify putting down the prices asked.

Oranges:	
Valencias, fancy	$7.50@8.00
Valencias, choice	7.00@7.50
Lemons:	
Fancy, per box	5.50@6.50
Choice	4.50@5.50
Standard	3.00@4.00
Lemonettes	3.00@4.00
Grapefruit, fancy, new	5.00@6.00

DRIED FRUITS.

No change in quotations of dried fruits is noted this week. Dealers still feel that the growers are asking too much for apples and pears, and they say the buying is not heavy. Jobbers who ship the fruit East say that the demand is quiet; and while they are handling some apples and pears Eastern buyers will not buy in large quantities at present prices.

Apples	13c
Pears	10½@13c
Prunes, graded, price to growers: gain in dip	11c
Prunes, graded prices to growers:	
20-30, inclusive, per lb	15c

Amber	15@18c

RICE.

Paddy rice, 1918 crop	$4.32
Clear No. 1, 1918 crop at mill	7.00

HIDES.

Taken off from August 1 to September 1, all weights: No. 1, 19c; No. 2, 17c; No. 3, 16c; bulls and stags, No. 1, 15c; No. 2, 13c; kips, No. 1, 21c; No. 2, 19c; calf, under 15 lbs., No. 1, 33c; No. 2, 31c.

Horse—Dry, per lb.: No. 7, large, $2.25@2.50; medium, $1.75@2.35; small, $1.00@1.50; salted, $3.00@5.00; colts, 25@[illegible].

Special Deciduous Market Report

By J. L. Nagle.

Sacramento, September 2, 1918.

On account of shortage of labor and delays of cars in transit, conditions have been considerably upset in Eastern auctions this past week, and it was almost impossible to regulate the offerings. Consequently the market fluctuated considerably. There was a very strong demand in all markets for good, green, keeping stock pears, but ripe stock brought little or nothing.

Several straight cars of peaches were diverted from Middle West markets by the original purchaser, and sold at auction at a loss to the owner, and it was evident that speculators were not advised of the increased offerings of Jersey and Delaware stock. The arrivals also of New York and New Jersey Bartletts had a tendency to depress the market. Home-grown peaches were in heavy supply and, though a good proportion of the best stock was placed in storage for a later market, receipts were sufficiently liberal and sold at such prices as to practically bar the sale of California's at a profit.

All markets ruled fairly steady on plums.

Malaga grapes showed some decline under increased receipts, but as the stock is of good quality the demand was fair.

The weather in most of the Eastern markets has been unusually warm and consequently the trade is not prepared at this time for wine grapes; but as the stock is ripening shippers are compelled to move it and that which is sold at auction may not meet with ready demand for the first few cars.

The shipments of Tokays are light, as the berries are not sufficiently sugared Demand fair to the extent of the supply to permit of their being picked, but the movement should be heavy beginning next week. The crop, with the exception of the Florin district, is not in excess of 75 per cent. We look for a strong market on Tokays throughout the season.

The conditions governing the transportation of deciduous fruit seems to be becoming more acute each day and shippers can figure with no certainty on schedules. Following are the averages for the week:

New York: Grapes—Malaga, $1.64; Muscat, $1.82; Thompson Seedless, $1.59; Alicante Bouchet, $1.57; Tokay, $2.22. Peaches—California Cling, $1.15; Tuscan, $1.00; Crawford, 82c; Elberta, 80c; McDevitt, $1.53; Susquehanna, 55c; Albright, $1.40; Orange Cling, $1.46; Lovell, 56c. Pears—Bartlett, $2.59; B. Hardy, $2.10. Plums—Grand Duke, $1.63; Gros, $1.65; Giant, $1.26; Kelsey, $1.50; Diamond, $1.36.

Boston: Pears—Bartlett, $2.25; B. Hardy, $1.55. Peaches—Crawford, $1.00; Susquehanna, $1.04; Elberta, 92c; Lovell, 75c. Grapes—Rose Peru, $1.47; Malaga, $1.80. Plums—Kelsey, $2.06; Grand Duke, $1.56; Gros, $1.84; Giant, $1.40; Hungarian, $1.72; Diamond, $1.56. Grapes—Tokay, $2.59; Muscat, $2.31; Thompson Seedless, $1.28.

Chicago: Pears—Bartlett, $2.36. Peaches—Lovell, $1.14; Elberta, $1.16; Susquehanna, $1.33; Crawford, $1.40; Hulls Late, $1.35; Orange Cling, $1.35. Grapes—Malaga, $1.46; Thompson Seedless, $1.24; Rose Peru, $1.08; Black Prince, $1.40; Tokay, $1.97. Plums—Kelsey, $1.52; Gros, $1.45; Hungarian, $1.44; Giant, $1.38; Grand Duke, $1.69.

Total shipments, by cars, from August 23 to 29, inclusive: 55 peaches, 73 plums, 470 pears, 929 grapes.

LOS ANGELES

Los Angeles, Sept. 3, 1918.

BUTTER.

There was a dropping off in the receipts the past week, they being 279,200 pounds against 321,300 pounds the same week last year. Under lighter offerings the market for California extras held steady and demand fair. Some Eastern butter arriving and taken into cold storage caused a weaker tone to the market as a whole. There was taken into cold storage during the week 64,557 pounds, making the cold storage holdings now 564,595 pounds against 244,758 pounds the same week last year. We quote:

California extras 50c
do. prime first 48c
do. first 47c

Daily quotations—

1918—	Tu.	Wed.	Thu.	Fri.	Sat.	Mon.
Extra	50	50	50	50	50	50
1917—						
Extra	42	42	42	42	41	41

EGGS.

The supply of fresh ranch eggs the past week fell short of the demand and a snappy market was had for what few came in. Receipts by rail for the week were 613 cases against 815 cases the same week last year. The receipts by truck continue to run about four times as large as the arrivals by rail, making the supply for the week 2937 cases against 4075 cases the same week last year. There was withdrawn from cold storage during the week, to meet this shortage, 3048 cases. There was brought in from the East 960 cases of Eastern eggs.

Daily quotations:

1918—	Tu.	Wed.	Thu.	Fri.	Sat.	Mon.

1917—						
Extra	43½	43½	43½	43½	43½	43½
Case count	42	40	40	40	38	38
Pullets	38	37	37	37	36½	36½

VEGETABLES.

A fair market was had the past week for all good fresh stuff. Stale continue to drag. Potatoes are coming in more freely and Northern went off a little. Demand only fair. Local unchanged under moderate offerings. Onions slow sale and weak, though not quotably lower. Cabbage slow sale and lower. Bell peppers steady, but chiles higher and demand fair. Tomatoes, cucumbers, and summer squash unchanged, but slow sale. String beans scarce and higher. Lima beans in fair demand and steady.

We quote from growers:

Potatoes, local, per lug....75c@$1.00
do. do. per cwt. ....$2.25@2.50
do. northern, per cwt.... 2.75@3.00
Sweet potatoes, per lb ....3@4c
Garlic, per lb. ....8@9c
Onions—Stockton Yellow Danvers, cwt. ....$1.75@2.00
Onions—White Globe, per cwt... 2.00@2.25
Onions—Small Bermuda, per crate..80@90c
Cabbage, per 100 lbs....$2.25@2.50
Bell peppers, per lb....3@3½c
Chile peppers, per lb. ....4@5c
Summer squash, local, per lug....30@35c
String beans, per lb. ....8@9c
Tomatoes, home-grown, per lug....30@75c
Eggplant, Imperial Valley, per lb... 1@5c
Cucumbers, home-grown, per lug...30@45c
Corn, per lug of 3 doz....65@75c
Lima beans, lb. ....3½@4c

POULTRY.

There was quite a dropping off in the receipts the past week and under the influence of the light offerings broilers and hens were advanced a cent.

The following prices were agreed upon last Friday, August 30, and hold good until the coming Friday:

Broilers, 1@1¼ lbs. 34c
Broilers 1½@1¾ lbs. 34c
Fryers, 2@3 lbs. 29c
Roasters (soft bone), 3 lbs. and up....29c
Stags and old roosters, lb. 19c
Hens ....21@28c
Tom turkeys ....30@33c
Ducks ....22@28c
Geese 15c
Squabs, live, per lb. 30c
Squabs, dressed, lb. 40c

FRUITS.

Peaches steady, so are grapes and pears, and demand very good for all. Apples, too, continue to sell well at old prices. Figs are coming more freely and are a little lower, but demand fair at the prices. Quinces in better supply, slow sale and lower. Some avocado pears arriving and they are meeting with a fair demand.

We quote from growers:

Figs, Black Spanish, 7-lb. box....35@50c
do, White, 7-lb. box....30@50c
Peaches, freestone, per lug....75c@$1.00
do, clings, per lub ....$1.00@1.25
Pears, local, per lb....2@3c
Pears, Mountain ....3½@4c
Crabapples, per lug....$1.00@1.25
Plums—Satsuma, per lb....4@4½c
Nectarines, per lb....5@6c
Grapes—
Imperial Valley Malagas, per lb..2@2½c
do, Muscat, per lb....2@2½c
do, Thompson's Seedless, per lb..2@2½c
do, Tokay, per lb. ....4@4½c
Banana apples, 4-tier $2.25
Apples—Alexanders, 4-tier.... 2.25
do, 4½-tier 2.00
do, Gravenstein, 4-tier....$2.50
do, do., 4½-tier 2.25
Plums, per lb....5@6c
Quinces, per lug ....50@65c

BERRIES.

Sales are slow, as the market is full of other fruits that are to be had cheaply. Receipts light or prices would be lower.

We quote from growers:

Strawberries—
Fancy, per 30-basket crate....$2.25@2.50
Poor to choice, 30-basket crate. 1.80@2.00
Blackberries, 30-basket crate.... 1.80@2.00
Raspberries, 30-basket crate.... 2.75@3.00

MELONS.

The market was well supplied the past week with watermelons and as the weather was cooler sales were slow. Cantaloupes arriving less freely and under light offerings the best brought more money. Casabas steady. Honey Dew melons slow sale and weak.

Cantaloupes—
Tip Top, home-grown standard crate ....$1.00@1.10
do, do, pony crate ....65@75c
do, do, jumbo crate....$2.50@2.75
Columbia, jumbo crate .... 2.75@3.00
Casabas, per lb....2@2¼c
Pineapple, standard crate ....$1.00@1.10
Watermelons, per 100 lbs.... .75@1.00
Honeydew melons, 16-inch crate. .90@1.00
do, jumbo crate .... 3.00@3.25

BEANS.

This market is still dull. No new beans have been marketed, and buyers are holding back, waiting for the new crop to come in.

We quote from growers:

Limas, per cwt....$11.00
Large white, per cwt. 10.00
Small white, per cwt. 10.00
Pink, per cwt. 7.50
Blackeyes, per cwt. 7.00
Tepary, per cwt. 8.50

HAY.

Receipts very good and demand light. More coming in than is wanted by the trade from day to day and there is no disposition to buy ahead. The tone of the market is weak.

We quote f. o. b. Los Angeles—

Barley hay, per ton ....$24.00@26.00
Oat hay, per ton .... 26.00@28.00
Alfalfa, northern, per ton.... 21.00@22.00
Alfalfa, local, per ton.... 22.00@24.00
Straw, per ton .... 9.00@10.00

COTTON.

The first part of the week an active speculative market was had. From private reports indicating a still further loss in the crop conditions, October in New York was bid up by Thursday to 35.06c and December 34.50c. These prices caused much realizing towards the close of the day and on Friday and the market worked a little lower Friday. October in New York closed at 34.51c and November 33.94c. In New Orleans October closed Friday at 33.15c and December 33.11c. Spot middling closed in New York at 36.60c and in New Orleans at 33.25c. Monday being Labor Day and a holiday there was no market.

The People's Real Paper

"The initials P. R. P. stand for more than Pacific Rural Press," writes one of our enthusiastic subscribers. "They mean 'the People's Real Paper.'"

We hadn't thought of those exact words, but we certainly have been working hard to give you a real paper, and it is gratifying to know that our efforts are appreciated.

What is a real paper? E. S. Martin, the well-known magazine man, once said that the real publication is the one that can persuade its readers to think something they did not think before. "If it can give them a new attitude of mind, get them to move around and see something from a new standpoint, so that it looks different, that is real service," he said.

We are trying to do more than simply give you entertaining reading. We are trying to give you things to think about; things worth thinking about; new ways of solving your problems.

"I read the Rural Press with the liveliest appreciation and find it very profitable to act upon your suggestions; your advice is the best I can get," writes Miss Leila M. D'Oyly. That's what we want every subscriber to say. If you can't say it right now, probably it is because we have not touched upon the problems of deepest concern to you. So tell us what they are and we will publish articles that will cover the matters fully and will help you to remove every obstacle standing between you and Great Success. Read the tractor articles this week—they are printed to help you in your farm work.

Watch for next week's issue. It will tell all about the big doings at the State Fair and will contain a complete list of the awards. You will want to keep your copy permanently for reference. It will prove valuable for months and months.

Special Livestock Market Report

San Francisco, September 4, 1918.

CATTLE—There is a sluggish beef market for all grades excepting good choice steers, which continue to be scarce and to command premium prices. She stuff and half-finished stuff predominate the local market. In the East prices on all grades of cattle stay at the top, as packers are hard set to get enough cattle to fill Government orders.

Grass steers—
No. 1, weighing 1000 to 1200 lbs..11@11½c
No. 1, weighing 1200 to 1400 lbs..11@11½c
Second quality ....9@10½c
Thin ....7½@8½c
Cows and heifers—
No. 1 ....7½@8c
Second quality ....6@7c
Common to thin....3½@5½c
Bulls and stags—
Good 6c
Fair ....5@5½c
Thin ....4@4½c
Calves—
Lightweight 11c
Medium 10c
Heavy ....8@8½c

SHEEP—The local sheep market is pretty much at a standstill. The consuming demand is curtailed by the comparatively high prices prevailing. Much of the supply comes from outside the State.

Lambs—
Yearlings ....12@12½c
Milk ....12@14½c
Sheep—
Wethers ....11@11½c
Ewes ....8½@9½c

HOGS—Hogs are coming in somewhat more freely, but still below the requirements of the market. The 18c price has ceased to be a mere possibility, as 18¼c is this week offered for hard, fat, grain-fed hogs weighing 140 to 300 pounds.

Hogs—
Hard, grain-fed, 100@140....17¾c
do, do, 140@300....18¼c
do, do, 300@400....17¾c

DRESSED MEATS.

Steers, No. 1 ....18½@19½c
do, second quality....15@18c
Cows and heifers ....10@16c
Calves, as to size, etc....15@19c
Lambs—
Suckling ....23@25c
Yearling ....22@23c
Sheep—
Wethers 21c
Ewes ....18@19c
Hogs ....25@26c

Los Angeles, September 3, 1918.

CATTLE—Choice fed steers continue scarce and they are meeting with a good demand at steady prices. Thin and medium cattle, however, are being offered freely and they are dull and weak. Calves steady and in fair demand.

Per cwt. f. o. b. Los Angeles—

Beef steers, 1000 to 1100 lbs....$9.00@12.00
Prime cows and heifers.... 7.50@ 8.50
Good cows and heifers .... 7.00@ 7.50
Canners, per cwt. .... 5.00@ 5.50
Calves, per cwt. .... 8.50@ 9.50

HOGS—Offerings of hogs continue light and what are coming in are only in medium flesh, showing the economy of feed, at steady prices.

Per cwt. f. o. b. Los Angeles:

Heavy, averaging 275@300 lbs..$15.50@16.50
Mixed, 225@275 lbs. .... 16.00@17.00
Light, 175@220 lbs. .... 16.50@18.00

Rough docked 20 pounds, piggy sows 40 pounds and stags 40 per cent.

SHEEP—Offerings light and market rather firm and demand good for what few are coming in. Killers still have to reach out to get what they want. Utah and Nevada furnishing most of the supply.

Per cwt. f. o. b. Los Angeles—

Prime wethers ....$9.00@10.00
Prime ewes .... 8.50@ 9.50
Yearlings .... 9.50@10.50
Lambs ....15.00@16.00

Portland, September 3, 1918.

CATTLE—Slow; receipts, 768 head. Steers, prime, $12.50@13.50; good to choice, $11.00@12.00; medium to good, $9.75@11.00; fair to medium, $8.75@9.75; common to fair, $5.75@8.25; cows and heifers, choice, $8.35@9.50; medium to good, $6.25@7.75; fair to medium, $5.25@6.25; canners, $3.00@5.00; bulls, $5.00@7.00; calves, $9.00@12.00; stockers and feeders, $6.00@8.00.

HOGS—Lower; receipts, 483 head. Prime mixed, $19.75@20.00; medium mixed, $19.25@19.50; rough heavies, $18.25@18.50; pigs, $16.75@17.75; bulk of sales, $19.75.

SHEEP—Higher; receipts, 1542 head. Prime lambs, $14.00@15.25; fair to medium, $11.00@13.00; yearlings, $10.50@12.00; wethers, $9.00@10.50; ewes, $7.00@9.00.

Forty-eighth Year

SAN FRANCISCO SEPTEMBER 14, 1918 LOS ANGELES

State Library

State Fair Reveals California's Opportunities

Written for Pacific Rural Press by R. H. Whitten

AS I SAT on a bench at the State Fair and watched the different spectators, I thought of the five men who walked out into the country one day. The first saw only the dusty, lonely roads, the rough farm buildings, and the disagreeable features. The second beheld rolling hills and smiling meadows, pretty flowers and sparkling waters, and he was enraptured with the beauty of it all. The third observed the people at work, their manner of living and the indications of social and religious activity. The fourth saw the teeming insect life of field and woodland, and searched out innumerable varieties of butterflies and bugs for his collection. The fifth wanderer stood on the hillside and saw stretched out below him a bustling city which the advantageous location suggested to his mind, and he immediately began planning a great real estate development.

The first three viewed things without any particular command of their sight, and without calling their imagination into play. The fourth directed his seeing for a definite purpose and found what he looked for. The fifth man alone looked upon the things before him and saw in them the greater things of the unseen.

KING SEGIS ALCARTRA PRILLY,
Owned by the Bridgford Company, Knightsen, grand champion Holstein bull at the State Fair both this year and last.

Many Types of Visitors Present.

There were people of all these different types at the Fair. Some evidently went just to say that they had attended, and they saw the jostling crowds, felt the heat (although the weather was exceptionally favorable) and were annoyed by a few inconvenient features. Others saw the good features and the fine exhibits, and went away with a favorable general impression. Others went to be entertained and found what they wanted in the thrilling aviation stunts, the races, the horse show and the different places of amusement. Others wanted to be instructed and they saw many demonstrations of great practical value, particularly the tractor and farm machinery exhibits and the war-time demonstrations of increased production and conservation. And others went with their long-lookers on and saw not merely the fine exhibits, but a future full of promise. They were men of vision, and they saw the name of California shining with new luster before the world.

Visitors With and Without Vision.

"Where there is no vision the people perish," said Solomon, and his wisdom finds direct application in present-day farming, for the farmer who forms his opinion from casual observations, from surface conditions, from a search for unfavorable circumstances, rather than from his vision of the unseen, will find only rough roads, poor soil and innumerable barriers to his progress. But the one who has vision—who searches beyond the seen for the unseen; who looks not for difficulties but possibilities—this one will make great discoveries. He will find the most precious opportunities in the most forbidding difficulties; he will transform desert lands into paradises; he will make unproductive fields produce bumper crops.

Of course, such a man has to struggle long and hard to make realities of his visions. He meets many setbacks, but these are like the swollen stream which turns back upon itself through the valleys. One ignorant of the stream's destination would say that it flows back to the hills, but it doesn't. Its general course is always onward toward the lake or ocean.

Livestock Industry Holds a Future of Promise.

And one ignorant of the real facts might think that California's livestock industry is going backward when he hears that dairy herds are being sold off and beef cattle are being shipped out of the State on account of the labor and feed situation. But it isn't. And no one with any vision at all could see the stock exhibited at the Fair and witness the demonstrations of California's resources without seeing a future full of promise for this most important branch of farming.

If he had a reasonable amount of vision, he would see the map of the pure-bred world changed, and California made the fountainhead. He would see breeders and farmers coming here from the east, from the north, and from foreign countries to buy foundation stock and new blood.

This is already being done. Recently several large eastern and foreign sales have been reported. And why should it not be done on a much larger scale? We have the feed and the natural conditions that cannot be equaled elsewhere. Only a short time ago the Department of Agriculture completed an investigation which showed that California is the most economical place in America for raising sheep, and it is equally as good for other kinds of livestock.

California's Livestock Advantages.

And not only can we raise stock cheaper out here, but we can raise it quicker and better. This was clearly proved by the size and quality of the stock shown at the Fair. Practically all of the breeders who showed this year were short of help, and, considering the handicaps under which they fitted their stock, the showing was nothing short of marvelous. Dozens of the prize winners were good enough to win similar ribbons at eastern shows, and to convince the people back there that "to find the best you must come out west."

Another feature which is going to help the livestock industry of this State is the pull-together spirit which is being developed among the breeders. A feeling of good fellowship was noticeable both in the barns and at the meetings of the different breed associations. On account of lack of space, we cannot tell in this issue of the important business transacted at these meetings, but this will be covered in later issues, and more will be said about the prize winners in the different classes.

TWO GREAT DRIVES TO SAVE CIVILIZATION!

TWO GREAT movements to rescue the world from autocracy and anarchy are in progress this month and their ultimate purpose is to sweep the world clean of evil in high places. There is no hope of cleansing the heart of man by the wager of battle but rather to free mankind from domination which implants and cultures evil and for its own purposes defies regeneration and ennoblement which God provides. It is our purpose in the war to overthrow such domination, which, to serve its ambition, greed and inhuman lust, violates sacred treaties and the humane usages of nations in the vain hope of establishing world-power upon the wreckage of free peoples crushed by outrage. And now frustration and retribution for such foul thought and atrocious deed draw nigh through the great forward movement of the allied armies along the European front, from the Adriatic to the Alps and from the Alps to the North Sea, which is proving irresistible. Simultaneous with this great west-front movement, in which nearly the whole world of nations joins, there is another great movement in progress this month on the Western Hemisphere the success of which is indispensable to allied victory on the other side of the world. It is the movement of the United States, from Maine to California and from the gulfs of Mexico and California to our northern borders, to provide the funds without which no European movement of allied armies can be successfully sustained and no victory won for civilization against autocracy which itself practices international anarchy and hires private anarchists to indulge their lust for outrage in all parts of the world. It is a new mobilization of America's fighting forces: it is the enlistment of America's billions to push America's millions onward to Berlin: it is giving American bonds for the attainment of world freedom!

AMERICAN EQUALITY OF OBLIGATION.

IN AN appeal to Americans to discharge their patriotic duty by freely placing the funds which they possess at the service of their country in its time of greatest need, it is undemocratic to single out any group of citizens and impute to it especial obligation. Patriotic duty rests upon every citizen to the extent of his individual ability to discharge it, by whatever manifestation of loyalty and devotion he can encompass. Therefore, it is un-American to address a patriotic appeal to those who live by any particular profession or occupation, and it is un-American also for those in any class of industry or enterprise to declare that any other class should recognize any less or greater obligation than its own. To do this is to make confession that our democracy is a pretense and that we do have, after all, "classes" in our population, some of which are expected to lead and others to follow in the very greatest of our national duties—which is to preserve our democratic institutions and to extend their beneficence to all mankind. Whoever makes such a confession admits that, in his view, our democracy is a sham, and everyone who feels in his heart the American spirit impelling him to struggle and sacrifice for humanity knows that such confession is an impeachment of our national character and purpose and an outrage upon the memory of our national forefathers.

For this reason it is wrong to appeal to American farmers as a "class" to declare that it is their duty as a "class" to come forward beyond other "classes" with subscriptions to the Fourth Liberty Loan because as a class they have wealth and because their products have attained high prices, etc. In fact, it is very doubtful whether they have gained as much from war conditions as other "classes" have—but all such discussion is offensive to the patriotic spirit and to the American conception of citizenship, and should be abandoned. Men and women who gain a livelihood by farming should be appealed to to buy Liberty Bonds to the limit, just as other Americans are—because free buying of bonds and sacrifice to buy them are a patriotic duty and privilege to insure the continued existence of this country and to enable it to enforce upon the world the terms of its own birthright to set free and uplift the oppressed of all mankind. If farmers are appealed to on this ground, there can be no doubt that the response will be beyond all calculation of their resources as proportional to other group-ownership of our national wealth.

HOW AMERICAN FARMERS EARNED EQUALITY.

BUT although farmers should be appealed to as loyal Americans and not as a class thereof, it is perfectly proper to recall the fact that it was due to the patriotic attitude of the land-owning farmers who took part in the foundation of this country that their successors in the agriculture of this country do not constitute such a ruling class as owners of the land have constituted in all other countries—from remote ages to the present time. If the farmers of the revolutionary period had yielded to the historic ambition of powerful men to establish an oligarchy of land-owners, no power on earth could have stopped them. They had the law-making power; they had titles to vast estates which could have been easily extended to the national boundaries; they were the commanding officers and the main body of the warriors of 1776, and the leading office-holders of the construction period which followed the success of the Revolution. But they had another possession which was more powerful than all the temptation of the advantages which they possessed and that was the spirit of world patriotism which a great American farmer wrote into the Declaration of Independence—to the effect that all men are created free and entitled to equal opportunity for life, liberty and pursuit of happiness.

WE INHERIT REWARDS OF SELF-DENIAL.

IT WAS then owing to the great patriotic sacrifice of the early American farmers that they did not constitute themselves a ruling class in this country and consign those who worked for them to serfdom or peasantry. It was one of the great achievements for mankind of all the ages!

In 1844, in his address at the New York State Fair, George Bancroft, the great American historian, said this:

"The farmer's mind is exalted: his principles stand firm as your own Highlands. In his connection with the human race the farmer never loses his patriotism. He loves America—is the depository of her glory and the guardian of her freedom. I recount how the farmers of New York have served their country and mankind. They were invested with sovereignty and abdicated. Glorious example! Highest triumph of disinterested practice! They themselves peacefully and publicly renounced their exclusive authority and transferred power in this republic from its territory to its men!"

It was this initial sacrifice for mankind which constituted American farmers, who established this nation, the creators of American opportunity which the American army and navy are now translating into manhood opportunity for the whole earth. In all the issues which have arisen since that great initial sacrifice American farmers have poured out blood and treasure that the self-denial and magnanimity of their forefathers shall always stand forth "a light to humanity; a joy to the nations—the glory of the world."

If a word is to be said especially to the American farmers of 1918 about the Fourth Liberty Loan, let it be no appeal to a class, for their forefathers declared there should be no class. Let it convey no suggestion of particular obligation, which may be narrow and therefore possibly misconceived; but simply proclaim in their hearing the urgency of the country's need of their co-operation to finish now what their ancestors so grandly entered upon one hundred and forty-two years ago—the attainment of freedom for mankind.

STRENGTHENING FOUNDATIONS OF PATRIOTISM.

OF COURSE, in exalting our farming population as fundamental in national patriotism we do not exclude other vocations from similar relations. Other vocations have their own advocates: we simply write of what we know most about and make no odious comparisons. It is an interesting fact, however, that after every fierce struggle in which he has engaged at home and abroad Uncle Sam has arranged to establish an increased number of his sons and daughters in ownership and development of reasonable pieces of his national domain—thus rewarding them for patriotic services and at the same time strengthening the foundations of patriotism through the extension of clean rural life and prosperous rural industry in this country. Through the beneficent action of homestead laws and desert-land and national irrigation acts of Congress, people unsettled by war and by economic difficulties have been given a new start and the country has grown wonderfully by development of unproductive lands into new homes and centers of productive activity. Such governmental policy is now more clearly wise than ever and it is natural that it should also be more rational and generous because the righteous claim of agriculture to national credit facilities, education and expert personal guidance toward practical success is now more clearly recognized than it has ever been in the past.

Uncle Sam now needs to borrow six or eight billion dollars to win the war against murderous tyrants who have openly planned to lash the people of this free country to their chariot wheels! If he gets the money, and there is no doubt that he will get all the money he needs if everyone follows the dictates of his own conscience, the last national menace to world-freedom will be removed and all peoples can fearlessly enter upon the adjustment of personal rights between man and man under the justice-seeking governments which each people will set up for itself. As we have in this country the oldest and best popular government in the world, and as the principles upon which our government was established are right and true, all the reconstruction we shall need is to be secured by embodying those principles more definitely and securely in the laws which determine social and economic relations of individuals and vocations throughout our citizenship. In this peaceful revolution of ideas which will renovate and ennoble the public mind to truer standards of equality of opportunity for all citizens of the republic, there will be no greater forces than the strengthened resolution and clarified vision of our returning soldiers. They went from us boys: they will return sages and prophets in the nobility of manhood, the sanctity of womanhood and the inviolability of childhood—three foundation stones of national truth and greatness which the Teutonic federation has vainly endeavored to blast from their places in the civilization of mankind.

CHERISHING A GREAT NATIONAL FORCE.

TO CHERISH and promote the operation throughout the length and breadth of the country of this great force for the recognition and realization of higher ideals in Americanism, it is of fundamental importance that our returning soldiers shall be situated and circumstanced for the exercise of influential action of their new conceptions of efficiency in achievement and their clarified vision of human rights and privileges. These new powers will find scope, of course, in all our vocations and occupations, but in none to such degree as in agriculture—our greatest national industry. Upon this broad conception of its fundamental patriotic importance we

hail with delight the announcement of immediate and most practical action toward preparing idle lands to serve as homes and fields of promising industrial activity for our returning warriors. Such an announcement of intention has been made by that distinguished Californian, Hon. Franklin K. Lane, now Secretary of the Interior in the National Government. We have already mentioned it as a great beneficent policy. The following is an official announcement:

Secretary Lane presented to the President and to Congress recently a comprehensive plan for a preliminary study of the unused lands of the country, with particular reference to the irrigation of some 15,000,000 acres of arid land, the drainage of between 70,000,000 and 80,000,000 acres of swamp land, and the clearing of approximately 200,000,000 acres of cut-over or logged-off land, with the purpose in view of reclaiming these lands through Governmental agency and providing homes for returned soldiers.

In this connection we merely wish to state that the plan has received congressional approval and appropriation and is now in process of development. It will open great areas upon which returning sons of farmers and others will secure ownership of lands as their fathers did, but on conditions fairer and more generous.

Of course, the six or eight billions which Uncle Sam now asks for are to be used to win the war and to secure for this country the right to exist in the freedom and independence for which our ancestors gave their lives and their earnings. But it is important as a corollary to that demonstration to know that a greater and fairer national life is also an objective and that the most direct avenue to such attainment, through the exaltation of agriculture to greater influence in national affairs, is fully recognized.

The farmers of today are asked to lend their surplus billions to Uncle Sam that the farmers of yesterday may not have lived in vain—"Yea, saith the Spirit, that they may rest from their labors and their works do follow them."

QUERIES AND REPLIES

By the Editor.

Inquirer Must Give Full Name and Address.

Why Do Substitutes Cost More?

To the Editor: Where is the profiteering to be located in this case? I am urged to use oats instead of wheat. In buying a package of rolled oats I pay 40c or 45c for a 3-pound 7-ounce package. If I buy rolled or flaked wheat I pay only 35c for 3-pound 8-ounce package. The market price of wheat is $3.50 per hundred, but for my oats I get $2.50 per hundred, or $1 less than for wheat. Is this just? It does not seem reasonable to me.—Reader, Live Oak.

We have never seen a satisfactory explanation of the greater cost of "substitutes" for wheat. It was upon this fact that a strong argument was made that the wheat price should be fixed higher or that prices of other grains should also be fixed in proper relation to the wheat price. But on the basis of relative prices of wheat and oats which you cite, price fixing of other grains would not help matters. When you get beyond that the excessive price of oat meal must be explained upon the basis of profiteering by somebody—unless it can be shown that the loss of weight in preparation of foods from raw wheat and raw oats must be considerably greater in the case of oats (which we presume is the fact) or the cost of the process is greater in the case of oats than of wheat—and about that we do not know anything. No doubt the Food Administration has carefully looked into the matter and the fact that it is allowed to exist indicates that the situation is irremediable. The fact seems to be that we must grow more wheat or we must save more if we really wish to get the kaiser, and we must make sacrifices to do it. Patriotism exacts a price. At the moment we must eat less wheat. We may save money while doing it by filling our tummies with spuds or, if we must have substitutes grain foods, we must pay more for them. It is much the same way with other things. If we wish to keep the other sides of us warm and save money also, we must patch our pants: if we must have a new pair, we must pay more for them—even if they are made of burlap and not of wool. Life-saving the world is serious business. After we get it rolled up high on the beach of the future to dry off in the sun of a newer and fairer civilization, we can turn about and get even with those who have been increasing our sufferings and sacrifices by profiteering in wages, in financial, commercial and manufacturing profits and otherwise. The day of reckoning will surely come.

Winter Feed for Hogs.

To the Editor: I have land which is not considered good for grain ranch but is well adapted to raising corn. This means, however, a period of idle months until time for corn planting. I have at present twenty hogs and wish to purchase more. What can you suggest raising this winter for hog feed? I note in a recent Rural Press that oats are suggested for pasture. I had thought also of planting beets. How late would it be safe to plant the seed? What kind do you consider best for this purpose? If you can suggest anything else which might be planted this fall which would make good feed for hogs, would appreciate it very much. There is corn on the land now.—R. L., Los Molinos.

Why is the land not considered good for grain? If it gets submerged or water-logged so that grain kills out, that fact will also limit the use of the land for any winter-growing forage plant or roots—unless you can get the growth started early in the fall and let the hogs graze during the early winter before the water overflows or rises in the soil. As it is now in corn, it perhaps has enough surplus moisture to start seed as soon as you get the corn stubble cleared off and to continue the growth with the early rains. If so, you can start oats or rye and vetch—about 50 pounds of red oats and 40 pounds of common or Oregon vetch to the acre, sown together. Rye is rather hardier than oats and may be a safer venture. Stock beets, either mangels or tankards, can be started as soon as you can get the land in shape, if it has moisture enough to start the seed, and will reach feeding size by February or March if the land does not go under by that time. We are going on the supposition that the trouble with the land is excess of winter water. If that is not the case, the advice we give is more likely to be valuable, for land which will give good corn in summer ought to grow almost anything in winter—unless it is too wet.

Winter Care of Asparagus.

To the Editor: I planted out an asparagus bed in my garden with two-year-old roots. How should I treat the bed this winter?—O. R. B., Novato.

If your roots were strong and caught well, they must have made considerable top growth this summer. When that dies down, as it will presently, if it has not already done so, break it down and burn it on the bed in case there may be some rust germs to destroy or some seed to make volunteer plants among the old roots which are not desirable. Then cover the bed with coarse manure, several inches deep, and let it lie for the rains to leach out. This not only enriches the ground but prevents packing the surface by heavy rains. Towards spring, when the ground breaks nicely and shoots show where the roots are, cover in the remains of the manure by shallow forking between the plants or rows. It would be for the strength of the roots and the future crops not to cut any shoots in 1919—but we are afraid you will not heed this suggestion if you see fat ones coming. If you must have some, be sure not to cut many and let all the later shoots make all the top growth they will.

Subsoiling Young Orchard.

To the Editor: I have intended to subsoil thirty acres of my almond orchard which are planted on a light soil underlaid by clay or hardpan. I had intended to subsoil just before the trees became dormant. Another grower recently advised me to do the work well before the rains begin, as it would break up the subsoil better and deeper. Will this unnecessary loss of moisture, caused by leaving the land in the rough, affect the trees to any extent, or would it be advisable to wait until later in the fall? How close to the tree is it advisable to go with the subsoiler? The trees are only about twenty months old.—W. R. G., Paso Robles.

Do not open up the soil deeply until you have had rain enough to moisten it down at least a foot. This moisture is necessary to keep the trees from drying out by the free entrance of dry air—which deep working would certainly cause if done now and the rains should be long delayed. Keep the subsoiler at least three feet away from the trees and farther if you find you are tearing up many roots. It is very desirable to do the subsoiling as soon as you can after danger of drying out has passed.

HAS YOUR SUBSCRIPTION EXPIRED?

To relieve the paper shortage the Government has made a new ruling that subscriptions cannot be carried for more than three months after they expire.

You can't afford to miss a single issue of the Rural Press, so look at the date on the yellow label and see if your subscription has expired. If it has, send along a check, money order, bill or stamps, so that we shall not be obliged to cut your name from our list.

And why not pay up for two or three years in advance? We may be obliged to increase the subscription price soon, but right now you can renew for from one to five years at $1 per year. You cannot invest money to better advantage; send in a long-time renewal now.

Cutting to Kill Willows.

To the Editor: Can you tell me a sure way to kill willows? I had always heard that cutting them in dark of the moon in August would do the trick. I tried that last August and now they are about nine feet high and probably six shoots to one before. The soil is ideal for their growth, being creek bottom.—N. B. W., Thalheim.

The moon has nothing to do with it. Cutting in August is getting nearer to the killing because the time to cut a deciduous tree or shrub to kill it is to remove the top when it has reached its maximum seasonal growth and the "sap it all up," as the saying is. The root is weakest then and begins to renew its strength by the downward movement of the sap from the top. Therefore, to remove the top then comes nearest to killing the plant. But the willow guards itself against such exhaustion—especially in such a place as you describe, where continuous moisture helps it. For this reason there is little hope of killing willows without grubbing out the roots, and that has to be continued so long as new shoots appear.

When to Cut Back Eucalyptus.

To the Editor: When is the best time to cut my eucalyptus trees back, which are rather large trees already?—F. H., Visalia.

When you have time for it. We have never seen a eucalyptus tree depressed by cutting back, though it probably feels worst about it if cut back when at the height of its new growth. It will heal and cover its wounds quickest when cut just before new growth begins, and theoretically that would be the best time. But practically it does not seem to care—even if you cut off its tail just back of the ears. The eucalyptus is one of the gladdest things that ever came to California, and it is perhaps our finest exemplification of the doctrine of service and sacrifice. If Californians would buy Liberty Bonds the way the eucalyptus grows, there would not be enough of them left untaken to fill the quota of Rhode Island!

Stop Worrying the Peanuts.

To the Editor: I have a small acreage of peanuts and have been told to cover over with soil when the blossoms appear. I have done so and the ends (after a few days) have begun to sprout out and on some blossoms have appeared.—Reader, Atwater.

You have wasted your time and perhaps thrown the plants out of step also. There was an old notion that the bloom-stem had to be covered with earth to get the peanuts underground. The inventor of that misconception probably forgot to wonder how the plant did it when there was no fool around with a shovel. The fact is that the bearing shoot gets itself underground all right after pollination. All the grower has to do is to plant in a mellow soil and cultivate to keep the surface from crusting.

California Weather Record

The following rainfall and temperature record is furnished the Pacific Rural Press by the United States Department of Agriculture Weather Bureau at San Francisco for the week ending at 5 p. m., September 10, 1918:

Stations—	Rainfall Data: Past Week	Seasonal To Date	Normal To Date	Temperature Data: Max'm	Min'm
Eureka	.20	.73	.41	62	52
Red Bluff	...	.12	.12	90	56
Sacramento	...	...	.07	88	54

San Jose	...	...	...	80	48
Fresno	.01	.01	...	92	56
San Luis Obispo	...	.01	.05	90	50
Los Angeles	...	.11	...	92	58
San Diego	...	.04	...	80	60

GROZ-IT

HIGHLY
Concentrated - Pulverized

Manure

A mixture of cattle and sheep manure from animals fed on cotton seed meal and cake and alfalfa (highly nitrogenous foods) aged for several years under climate conditions that remove moisture but prevent leaching and fermenting.

No odor.
No flies or insects.
No weed seed or foreign matter.
Many times plant food values of ordinary manure.
Guaranteed contents.
Nitrogen 1.5 to 2%.
Phos. Acid, P_2O_5, 1.25 to 2%.
Potash K·O water soluble, 4 to 5%.

We are shipping GROZ-IT in immense quantities to Southern and Eastern states where present freight rates make it $10 per ton more than cost to you.
Place your order now to insure delivery.
Sold in bags or bulk.
Write for circular and prices.

Standardization of the Dried Peach

[Written for Pacific Rural Press by John J. Fox.]

STANDARDIZATION of the dried peach is as necessary as in any other dried or fresh fruit industry—to promote its welfare, not only in production and in methods of handling, but more especially in marketing.

THE PUBLIC pays a premium for large fruit. The object of the Peach Growers' Association is to obtain results in marketing that shall be profitable to the grower and the consumer alike by stabilizing the market and extending its activities and by guaranteeing the pack. These things can only be accomplished by co-operation and loyalty amongst the growers themselves.

We who attended the initial mass meeting at Visalia in 1915 well remember the panicky condition that prevailed at the prospect of the peach industry going by the board by reason of the ruinously low prices offered for dried peaches, then some 2c to 2½c below cost of production. We remember how the industry sweated in labor to produce that unity of action necessary for organization—an organization that was its salvation—no less.

Now that doubters and those who were faint hearted have been convinced of the necessity and are profiting by the work of the Peach Growers' Association, they are, as in duty bound, signing up and putting their shoulders to the wheel with the rest, to keep the good work going.

EXTENDING THE MARKETS.

As everybody in the business world knows, if you want to extend your markets in a healthy, growing manner, you have to advertise. This was never effectively done for the dried fruits until the California Raisin Association and the California Prune and Apricot Growers' Association did it. The packers could never agree on united action along this line and certainly one couldn't do it alone. They wanted to supply what market there was at the least possible expense, which was a very valid reason for not advertising. But it did not help the producer.

Now that the Peach Growers' Association has undertaken the matters of marketing and processing, it is this paper's business to keep close tab on cultural methods needed to produce fruit of the size, quality (and tonnage) that standardization demands. It is what we are here for—to obtain and spread the glad news of your successes in reaching perfection, that all the industry may profit thereby, also to learn from your mistakes to know what to avoid. In this matter also there must exist that frankness of statement and action that we are willing to accord. There is so much to learn yet in all the varied conditions for the same fruits the State over. And we are all so hungry for information whereby the fruits of our efforts may attain the highest results.

WHAT WE ARE STRIVING FOR.

We shall expect to deal regularly with and discuss varieties best suited to certain localities; methods of cultivation, irrigation, drainage, spraying, pruning, thinning; also of fertilization. For each one of these matters is a factor in determining the quality of the fruit and the welfare of both orchard and owner.

As a summary, what are we striving for?

The answer is:

(1) The finest fruit we can get.

(2) A minimum of culls and waste.

(3) A well-sugared article, ripe when cut and properly cured.

(4) A healthy, growing condition of our trees, that neither they nor the soil that produces them may wear out unduly.

(5) A remunerative price, free from speculative values, to relieve anxiety; stable, because free from inflated prices (which would be productive of over-planting) or unremunerative ones.

Every great and growing industry in the world is now organized—one for all and all for one.

The horse that does not "pull" is either taking it easy at the expense of the rest or else hanging back in the breeching. It may give him relief, but what does it look like?

ADVANTAGES AND SUGGESTIONS.

Let us look over what the Peach Growers' Association has done since it came into being. It has lifted the price of dried peaches from 2¾c in 1915 to 6½c in 1916, 8½c in 1917 and 11c in 1918. The first year, 1915, dried peaches were sold at perhaps 2c below cost. And though we admit that war conditions are responsible for the unprecedented high prices now, so are they responsible for nearly doubling the cost of labor to produce the article.

The association is bending all its efforts to improve the quality and condition of its processed fruit; to advertise and push out into fresh fields of consumption. The quality will also be helped by the fact that the association has had granted to it a patent for peeling dried peaches, thus removing the fuzzy objection so many housewives have offered to this staple.

The varieties chiefly used in the San Joaquin for drying are Muir, Lovell, Wheatland, Susquehanna and Elberta. We asked what the chief troubles were at harvest time and the reply was: First, unripe fruit. The fruit is either shaken or gathered just before it is ripe. This results in a poor color and quality, and the grower loses weight—a blow to the industry and a detriment to the producer, no matter how small the degree. Second, fruit delivered at the warehouse before it is thoroughly cured; that is, when the skin of a certain number still slips. Of course, nobody wants to lose any more weight than he can help, but there is really no excuse for shipping in uncured peaches in such a climate as ours, where they can be finished in the stack to such a nicety.

Finally, as regards payments, the cash down now amounts to three times as much as the total price three years ago. And by the end of the fiscal year the grower gets all there is in his crop in the subsequent payments, as in the other organizations—less only the cost of administration and operating.

With Fresno county alone growing 24,000 acres of peaches, this new staple is a sturdy youngster. May its shadow never grow less!

THE RISH BABA GRAPE.

To the Editor: I am sending you a bunch of large, oblong white grapes. I would like to have the name of them.—E. J. F., Sacramento.

[Answer by Professor F. T. Bioletti.]

The grapes which you sent me are a variety introduced a good many years ago by the Department of Agriculture from Persia, together with a large number of other varieties. This variety is the Rish Baba, a name which means "father's beard", and refers to the peculiar shape of the grape, which resembles in outline that of an Oriental beard. This grape has been shipped to Eastern points to some extent, but with somewhat varying success. It is grown in large quantities only, I believe, by A. B. Humphreys of Sacramento county. It has been rechristened, I believe, with the peculiar name of "baby toes," which appears to me to be unfair both to the baby and the grape. The grape is also known to grape growers as "Humphrey's Lady Finger." It is found in some vineyards under another Persian name, the Alhakahi, but this is a misnomer, as this name belongs to another variety.

University of California, Berkeley.

Farm Products
Must Increase

If we are to win the war and win it quickly our soldiers and our allies must be well fed. We cannot expect them to do their best to win unless we do our best to back them up. How are you going to make every acre of your farm produce to its utmost? Just as our army must be well fed so your soil must be fed. You must supply it with the elements necessary to produce crops.

GOLD BEAR
FERTILIZERS

are scientifically manufactured to meet California soil conditions and crop necessities. They are made from animal products that contain the necessary elements to feed your crops.

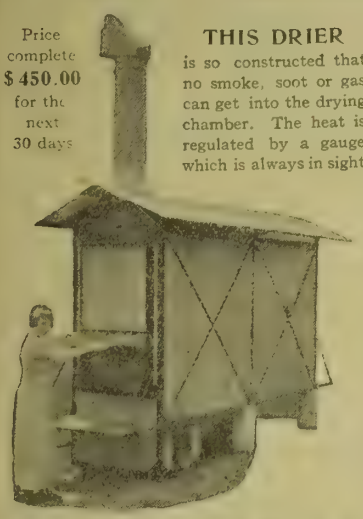
Fighting Squirrels—Testing Grapes.

Fred K. Howard, Horticultural Commissioner of Kings county, has made a pretty thorough campaign against the squirrels. We did not see one in his territory in a whole morning's drive, though he claims one section not yet worked. He is now testing grapes for the farmers to keep them posted on ripening of their crops, so as to know how to handle their crews. Twenty-four per cent of sugar on the greenest grapes is enough. Farmers who cannot do their own testing should appreciate this.

Price complete $450.00 for the next 30 days

THIS DRIER is so constructed that no smoke, soot or gas can get into the drying chamber. The heat is regulated by a gauge which is always in sight



With this New-Way Drier you can do drying on a commercial basis, or use it for home drying of any kind of fruit or vegetables. It can be used the year round, whenever there is anything available for drying purposes. It is not affected by outside temperatures and will give a perfect, even heat at all times. Can be fired when put up and the drying can start within a very few minutes. Write for circular.

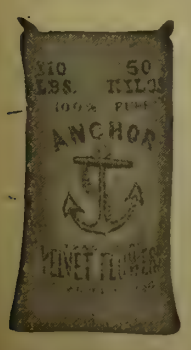
SULPHUR



Fleur de Soufre, Anchor Brand; Velvet Flowers of Sulphur and Eagle Brand.

Packed in barrels and double sacks; are the fluffiest and purest Sulphurs that money can buy; the best for vineyards; the best for bleaching purposes, leaving no ash.

Try our new brand of sublimed 100 per cent pure Ventilated Sulphur for making Paste — Atomic Sulphur.

For Lime Sulphur Solution, use our "S" Brand Refined Flour Sulphur, which we will furnish at a price so cheap that you cannot afford to purchase ready-made solutions.

We are equipped to make immediate shipment. Send for illustrated booklet; also price list and samples.

SAN FRANCISCO SULPHUR CO.

624 California St., San Francisco, Cal.

Farmers' Fire Protection.

The Kings County Farm Bureau has completed a farmers' fire protection project consisting of eight fire companies, each completely equipped with a fire trailer. There are 300 members on the force. Wallace Sullivan, the County Agent, brought in 11,000 pounds of dwarf milo from the State Farm at Davis and sold to the farmers. All is showing up well, the crop is good and the seed of the county will be improved.

Vineyard Interplanted with Teparies.

Arkalian Bros. of Livingston have a 450-acre two-year-old vineyard in new territory on the Merced river interplanted with tepary beans. It is all Thompson's Seedless and from present appearances promises well. Practically no Muscats are grown in this county, where development in breaking, leveling, drainage and irrigation is proceeding rapidly.

Moorparks Produce Well in Modesto

Last year the McHenry Bros. of Modesto produced over 18 tons of dried Moorpark apricots and 55 tons green from a 22-acre orchard. He sprays with lime-sulphur in February. The trees are free from scale and red spider. This large ranch is also growing 50 acres of castor beans for the Government this year.

Lime-Sulphur for Citrus Thrips.

The U. S. Department of Agriculture informs us that plain lime-sulphur solution, applied in three successive sprays, is a satisfactory control of the citrus thrips. The solution recommended may be either 1 to 56 of the 36 degree Baume density or 1 to 50 of the 33 degree Baume.

A District Fair.

A district fair will be held at Atwater on September 13 and 14. Atwater is the center of the sweet potato district and also ships large quantities of grapes and peaches. She has six packing houses and a cannery.

Prunes Lead in Kings.

In planting in recent years prunes have taken the lead in Kings county, then apricots, grapes and peaches in the order named. The drying peaches consist of Lovells. Muirs and Elbertas, while the favorite clings are Orange, Phillips and Tuscan.

Horticultural Notes.

The demand for the Nonpareil exceeds that of any other variety of almond this year.

Grapes have the largest acreage of the fruits of Tulare county. Peaches come second and citrus crops third.

Kings county has 102 miles of county highway, concreted and capped, in addition to the State highway.

The Muir seedling suckers badly and makes a smaller tree than the Salway seedling. The Lovell seed is the next best to the Salway.

The Raisin Growers' Association will spend $375,000 in advertising this year. It is these large business methods that have created new markets for our fruits.

The Kings County Packing Company is entirely financed by local capital and run by home labor. Its pay roll has run up to as high as $8,000 a week on apricots, peaches, tomatoes and cucumbers.

To permit students to finish up the summer work on ranches, the University Farm School at Davis will open two weeks later than usual. For the first time in the history of the University Farm School women will be admitted to the three years' course.

California produces all the almonds grown commercially in the United States. Profitable almond production depends upon: (a) Attention to cultural questions, and (b) co-operation in marketing. Checks are sent out by the Almond Exchange the same day warehouse receipts reach the main office when possible.

Turn Cutlery Steel Into Your Fields!

Do It With Clark "CUTAWAY" DISK HARROWS

That's what the disks are made of—a special cutlery steel—forged edge (cut out or solid)—so sharp and sturdy that mother earth crumbles into tiny particles just as you want her to.

Pulverize the soil well. Get it in the best condition to give the world bigger and better crops. Our Allies are depending on them.

WRITE FOR THIS BOOK

It's a valuable one to have; tells what you need to know about "The Soil and Its Tillage." With it, we will gladly send our complete Implement Catalog and names of your nearest dealers in CLARK "CUTAWAY" Implements.

Electric blasting easier and cheaper

GIANT FARM POWDERS

STUMPING—AGRICULTURAL

The use of an electric blasting machine results in economy. It reduces the amount of powder required often by 10% to 20%. With it you can shoot several stumps or other blasts at one time. You can fire several lighter shots under a difficult stump or rock with better effect and less trouble than with a single large charge. It is the only reliable means of exploding charges under water.

Safety favors electrical blasting. There are fewer misfires and no hang-fires. Should a misfire occur, all danger of explosion is over when you disconnect the wires from the machine. As you can time blasts to the second, traffic along roads is not held up unnecessarily.

The smallest Electric Blasting machine fires five charges or fewer at a time, weighs but six pounds and cost is saved on a job in a very few days. Anyone can work all sizes of this simple, handy machine.

Send coupon (or postal mentioning this paper) for big free book "Better Farming." Tells you scores of money-saving ways of doing farm work.

Horticultural Notes at the State Fair

[Written for Pacific Rural Press by John J. Fox.]

The three subjects that proved most attractive to horticulturists at the State Fair this year were tools and tractors, standardization and fruit packs, and rodent control and forestry. The horticultural exhibit was small compared with average years, but was quite as extensive as we had any reason to expect during war times. Tractors and tools have been dealt with in another article under "Agriculture," but we shall return to this subject later in their relation to orchard work.

STANDARDIZATION EXHIBIT—APPLES.

This exhibit, given by the State Commissioner of Horticulture, was of chief interest to fresh fruit growers, and its lesson was plain to all concerned. A chart on the wall gave at a glance the application and requirements of the standardization law. Its axioms are that standardization increases returns to the grower because the market will pay for first-class fruit. It decreases the cost to the consumer in that it avoids unnecessary waste in packing and transportation and extends markets. Standardization demands the best quality trees. It makes imperative greater care in cultural methods and in the handling of the fruit.

The exhibit displayed good and bad packs—what to do, how to do it, and what to avoid. The packs were taken at random from fruit sent to market and were not put up specially for this exhibit. Therefore they were all truly commercial packs. The three standards were shown—(1) California Fancy, (2) Grade B, and (3) Grade C; also packs showing violations of the apple law, underneath the chart illustrating the law. Practically all apple-growing sections now pack to a greater or less extent under State inspection. The principal violation of the apple law is a tendency of some packers to put B grade fruit in boxes and then label the whole as California Fancy. There was a "chiel amang us takin' notes" in the shape of J. M. Ward, pomologist and chief of fruit division of Tasmania, Australia, who has been sent over by his Government to learn what he can from our methods. He expressed admiration of the steadily growing organization of our fruit industry and its applied laws.

PEARS.

An interesting feature of the exhibit of pears (chiefly Bartletts) was the variation in color of the fruit due to locality, soil and climate. There were pears from Tehachapi at an elevation of 4000 feet, pears from Placer and El Dorado counties of 3000 feet elevation, from Nevada and Lake counties (2000 feet), and from the Sacramento Valley (30 feet), and the coloring varied from a deep rose blush on high ground (and probably red soil) to a lemon yellow. The "horrible examples" displayed as an offset to these fine packs were chiefly infested with worms, especially those entering the calyx, which showed there had been lack of efficiency in the first spray, when the little pear was just formed.

PLUMS.

These packs included the 4x4, the 4x5, the 5x5, the 3-basket crate of two tiers to a basket, and the Sykes package (½ bushel box). This Sykes system of packing looks like the best system we have yet seen. The cut papers cost less than wrappers, the rapidity of work is increased and uniformity of size is requisite. When packed they can be pressed into place with a regular apple press without suffering any mechanical bruising. The boxes are made in quarters, halves and full standard bushel sizes. The Sykes grader runs the fruit on parallel ropes wider at one end than the other, so that there is no rolling of the fruit. It is simple, cheap and effective. All standard packs should originate on the ranch and not from inspection points as repacks. The tendency in packing plums is to put small ones on the bottom of the basket and large ones on top. The slant-sided basket must go and be replaced with a straight-sided one. It is the only way to insure uniformity of fruit.

TOMATOES.

Here uniformity in size, quality and maturity are desired. Every effort is now being made to bring this about throughout the State, and close inspection will eventually bring this about. The cracks in the boxes are lined with nice, round, ripe tomatoes, but inside is the waste that the consumer has to pay for—measly, unripe, small stuff, unfit to put on the table.

Standardization is going to remedy this waste and give the consumer what he pays for, besides obtaining a better price for the shipper. It costs just as much freight on a box of cheap stuff as it does on a box of perfect fruit that will give remunerative returns.

THE GRAPE SITUATION

and cantaloupe inspection are now pretty well in hand. Great improvement has been made, to the satisfaction of the market and the grower.

The State Quarantine Division and the State Insectary Division had an interesting exhibit upstairs, showing live insects, beneficial and otherwise. Also samples of insect and fungoid pests intercepted and destroyed at points of entry into this State. Probably no officers in the State are more vigilant than these sentries of our fruit empire, whose duty it is to prevent an enemy alien insect or disease from establishing itself in our midst. Prevention is better than cure. Photographs showing quarantine work in foreign ports, in San Francisco, both on the ship and dock, examination of immigrants' baggage, bundles and feed bags were all on display and proved an object lesson on the way our fruit industry is safeguarded. It showed the citrus canker of Florida that is costing that State millions of dollars and hundreds of thousands of trees. The leopard and gypsy moth of the Eastern States, the plum and cherry curculios, the white fly (Mediterranean), and the fruit fly and many other things that are fatal in their own sections: pests that we are so far free from. And we rely on the Quarantine Division to keep us free.

Yolo county had about the best display of grain and corn we have seen in one show. There were 110 varieties of grain alone, two varieties of Chilian Red and one (Indian Runner) were the most perfect miller's wheat we have seen. In addition to Yolo's usual display of fruit, flowers and nuts, there was an especially fine show of Egyptian and broom corn, sorghum, alfalfa and rice.

Sacramento county had one of the largest exhibits. The chief and most striking feature was a show of peaches, every one of which was a perfect fruit. Sacramento and San Joaquin grow such a diversity of commercial crops that it is difficult to select those that stand out. The beans, grain, sugar, grapes and summer crops and cannery products were all represented.

The U. S. Food Administration exhibit attracted attention, with its dried vegetables and cereal foods and their relative values, comparing meats, vegetables, cereals, fruits, pulse and complete rations.

The California Almond Growers had a most attractive exhibit of nuts and a showing of the importance of the almond industry.

The California Nursery Company had an exhibit consisting of 37 different varieties of pears and 37 varieties of apples—plate exhibits. Also 30 varieties of packed plums and prunes. Their Giant rhubarb also attracted attention by reason of its size and appearance. One pie to a piece! In plums the demand for Burbank seems to be falling off, while the Giant is increasing in popularity. The President seems to be the favorite plum.

Mention must be made of the central feature of the Horticultural Hall made by the California Nursery Company of Niles. It consisted in a representation in miniature of a country estate. A billowy arrangement of ferns and shrubs showed low rolling hills and forest and in the center of the estate a handsome country house was set on a long hill slope. It was approached through alfalfa fields and citrus groves by a winding drive. At the back of the house there were hanging gardens and terraced grassy slopes, edged with vine-clad bowers at the head of which was a Grecian bath house.

There was also a Japanese exhibit from the San Joaquin, a Fresno county exhibit, the Y. M. C. A., American Red Cross (Pacific Division), State Commission of Immigration and Housing, and recruiting and naval exhibits.

THE U. S. FOREST SERVICE

had models of rangers' stations and posts, plans of woods and camps, with proper methods of building and leaving camp fires. A model of a "lookout" tower was shown and the fire kiosks that are distributed through the various forests of the United States, of which there are 152.

PLANT
FRUIT TREES
Between Your Grape Vines

Think ahead! Plant fruit trees NOW between your grape vines and in a few years you will have a profitable crop regardless of the vines. Fruit growing has always paid—and on account of the vast destruction of orchards in Europe and the immense demand for foodstuffs from this country, fruit growing will now pay better than ever before. When you plant—plant the best. Our trees are strongly rooted, free from disease, budded from orchards of proven productiveness, and are sure to grow and produce big crops of fine fruit.

TO PREPARE FOR THE RAINS REPAIR YOUR ROOFS WITH Pioneer ROOFING

NOW IS THE TIME TO GET READY

Have your roofs inspected and if they show indications of leaking this winter—have the repairs made now and don't be caught napping.

Keep your buildings up. Don't let them go to pieces for lack of adequate repairs. It is cheaper to repair than to rebuild.

The roof is the most important part of most every building. Just think of the great damage that one little leak can cause.

Pioneer Roofing
—is very economical

Its long life and splendid wearing qualities make Pioneer Roofing a favorite with careful buyers everywhere. In addition, its attractive appearance adds 100 per cent to the looks of the building.

ASK YOUR DEALER FOR PIONEER — THE ORIGINAL and reliable ready roofing. If he cannot supply you, write us.

State Fair Machinery Observations

[Written for Pacific Rural Press by R. E. Hodges.]

THE WRITER saw so much at the State Fair (and he didn't see half of what was there) that he has by far overwritten the space allotted and a great number of items must be held over in type until next week. However, the items remaining are a suggestion in a small way of what you can see September 17 to 21, near Los Angeles, at the mammoth demonstration, more than twice as many makes of tractors in action as are mentioned in these notes. You can see the tractors still and in action, the implements and accessories in tents and in the fields. Again we urge you to let every attendant talk himself dry at you regarding the merits of his machine if it might in any possible way fit your conditions. There are points of excellence in every machine which are plain and reasonable when pointed out, but which you will miss if you don't let the attendants and drivers talk to you. See announcement elsewhere of change of location, because 350 acres proved too small for the immense demonstration and exhibits to be staged near Los Angeles, September 17 to 21, inclusive.

Few Changes in Samsons.

The feature of the G M C Samson Sieve-Grip Tractor exhibit was a tractor with its inward gears and pistons exposed by turning back the cylinder head and taking off the hand plates and the crank case. A mirror under the engine showed conveniently the crank and piston rod bearings with the new oil distributor. One of the very few recent changes consists in substituting a separate pipe through which oil is pumped to each pan in the crank case for the single pipe previously used with four holes for the pans. Where oil became dirty one of the holes sometimes clogged and a pan and bearing went dry. The Samson people are getting a new electric furnace of six tons capacity per charge principally for use in making or tempering the steels which compose most parts of the tractor. The furnace previously used was of ¾-ton capacity. The factory is now turning out 45 tractors per week and selling as fast as they can be made.

Yuba 40-70 Horsepower.

The Yuba 40-70 tractor, which was first put on the market about a year ago, has stood up to the best wishes of its makers. It differs in only a few respects from the Yuba 12-20. Its motor and governor are made by the Yuba people, the motor being four cylinders cast and mounted singly. The handhole plates are big enough to take pistons out. The transmission is about the same as in the 12-20 and the track is of the same construction, but much larger and stronger. The whole machine is built close to the ground. The one on exhibition was sold during the Fair to Spencer Penrose of Colorado Springs. Mr. Penrose is president of the Colorado and Cripple Creek Railway.

Sandusky Drive and Drawbar.

Sandusky tractors have had no material changes recently, though it is notable that the newer 10-20-horsepower model has four cylinders cast en bloc lengthwise of the tractor, conforming more to the common practice than the four single cylinders set crosswise of the 15-35 model. Features of both are their large internal gear drives. The drawbar of the 10-20 model is of straps to a lug casting placed crosswise of the frame between front and rear wheels. This lug is strengthened by a Y bar to the front axle. Coil springs on the drawbar ends and the end of the Y cushion shocks; and it seems like the forward hitch of the drawbar would hold the front end down well in turning.

Nilson Three-Wheel Drive.

The newly introduced Nilson tractor, which has three 50-inch wheels, chain driven, on the same rear axle, has the drawbar hitched high to a channel frame which inverts over the central drivewheel and is well braced forward and backward. This tractor has flat springs under its forward end to permit running over rough ground without injuring the frame. The four-cylinder motor cast in pairs has force-pump water circulation and KW ignition. Everything is well enclosed from dust.

New Avery 5-10 Horsepower.

One of the striking exhibits was the new short-coupled Avery 5-10 horsepower, nestled on high in a decorated alcove lighted at night. This machine is the new model recently put on the market. Its wheel base is 109 inches, its width 35 inches and its height over all is 58 inches. It has a four-cylinder motor equipped with Atwater-Kent ignition. The copper-tube radiator is unlike the other Avery sizes in that it is cooled by fan. A special hitch may be obtained for use of horse plows, etc., and a specially long front axle may be used for potatoes and other row crops.

Trundaar Chain Tread.

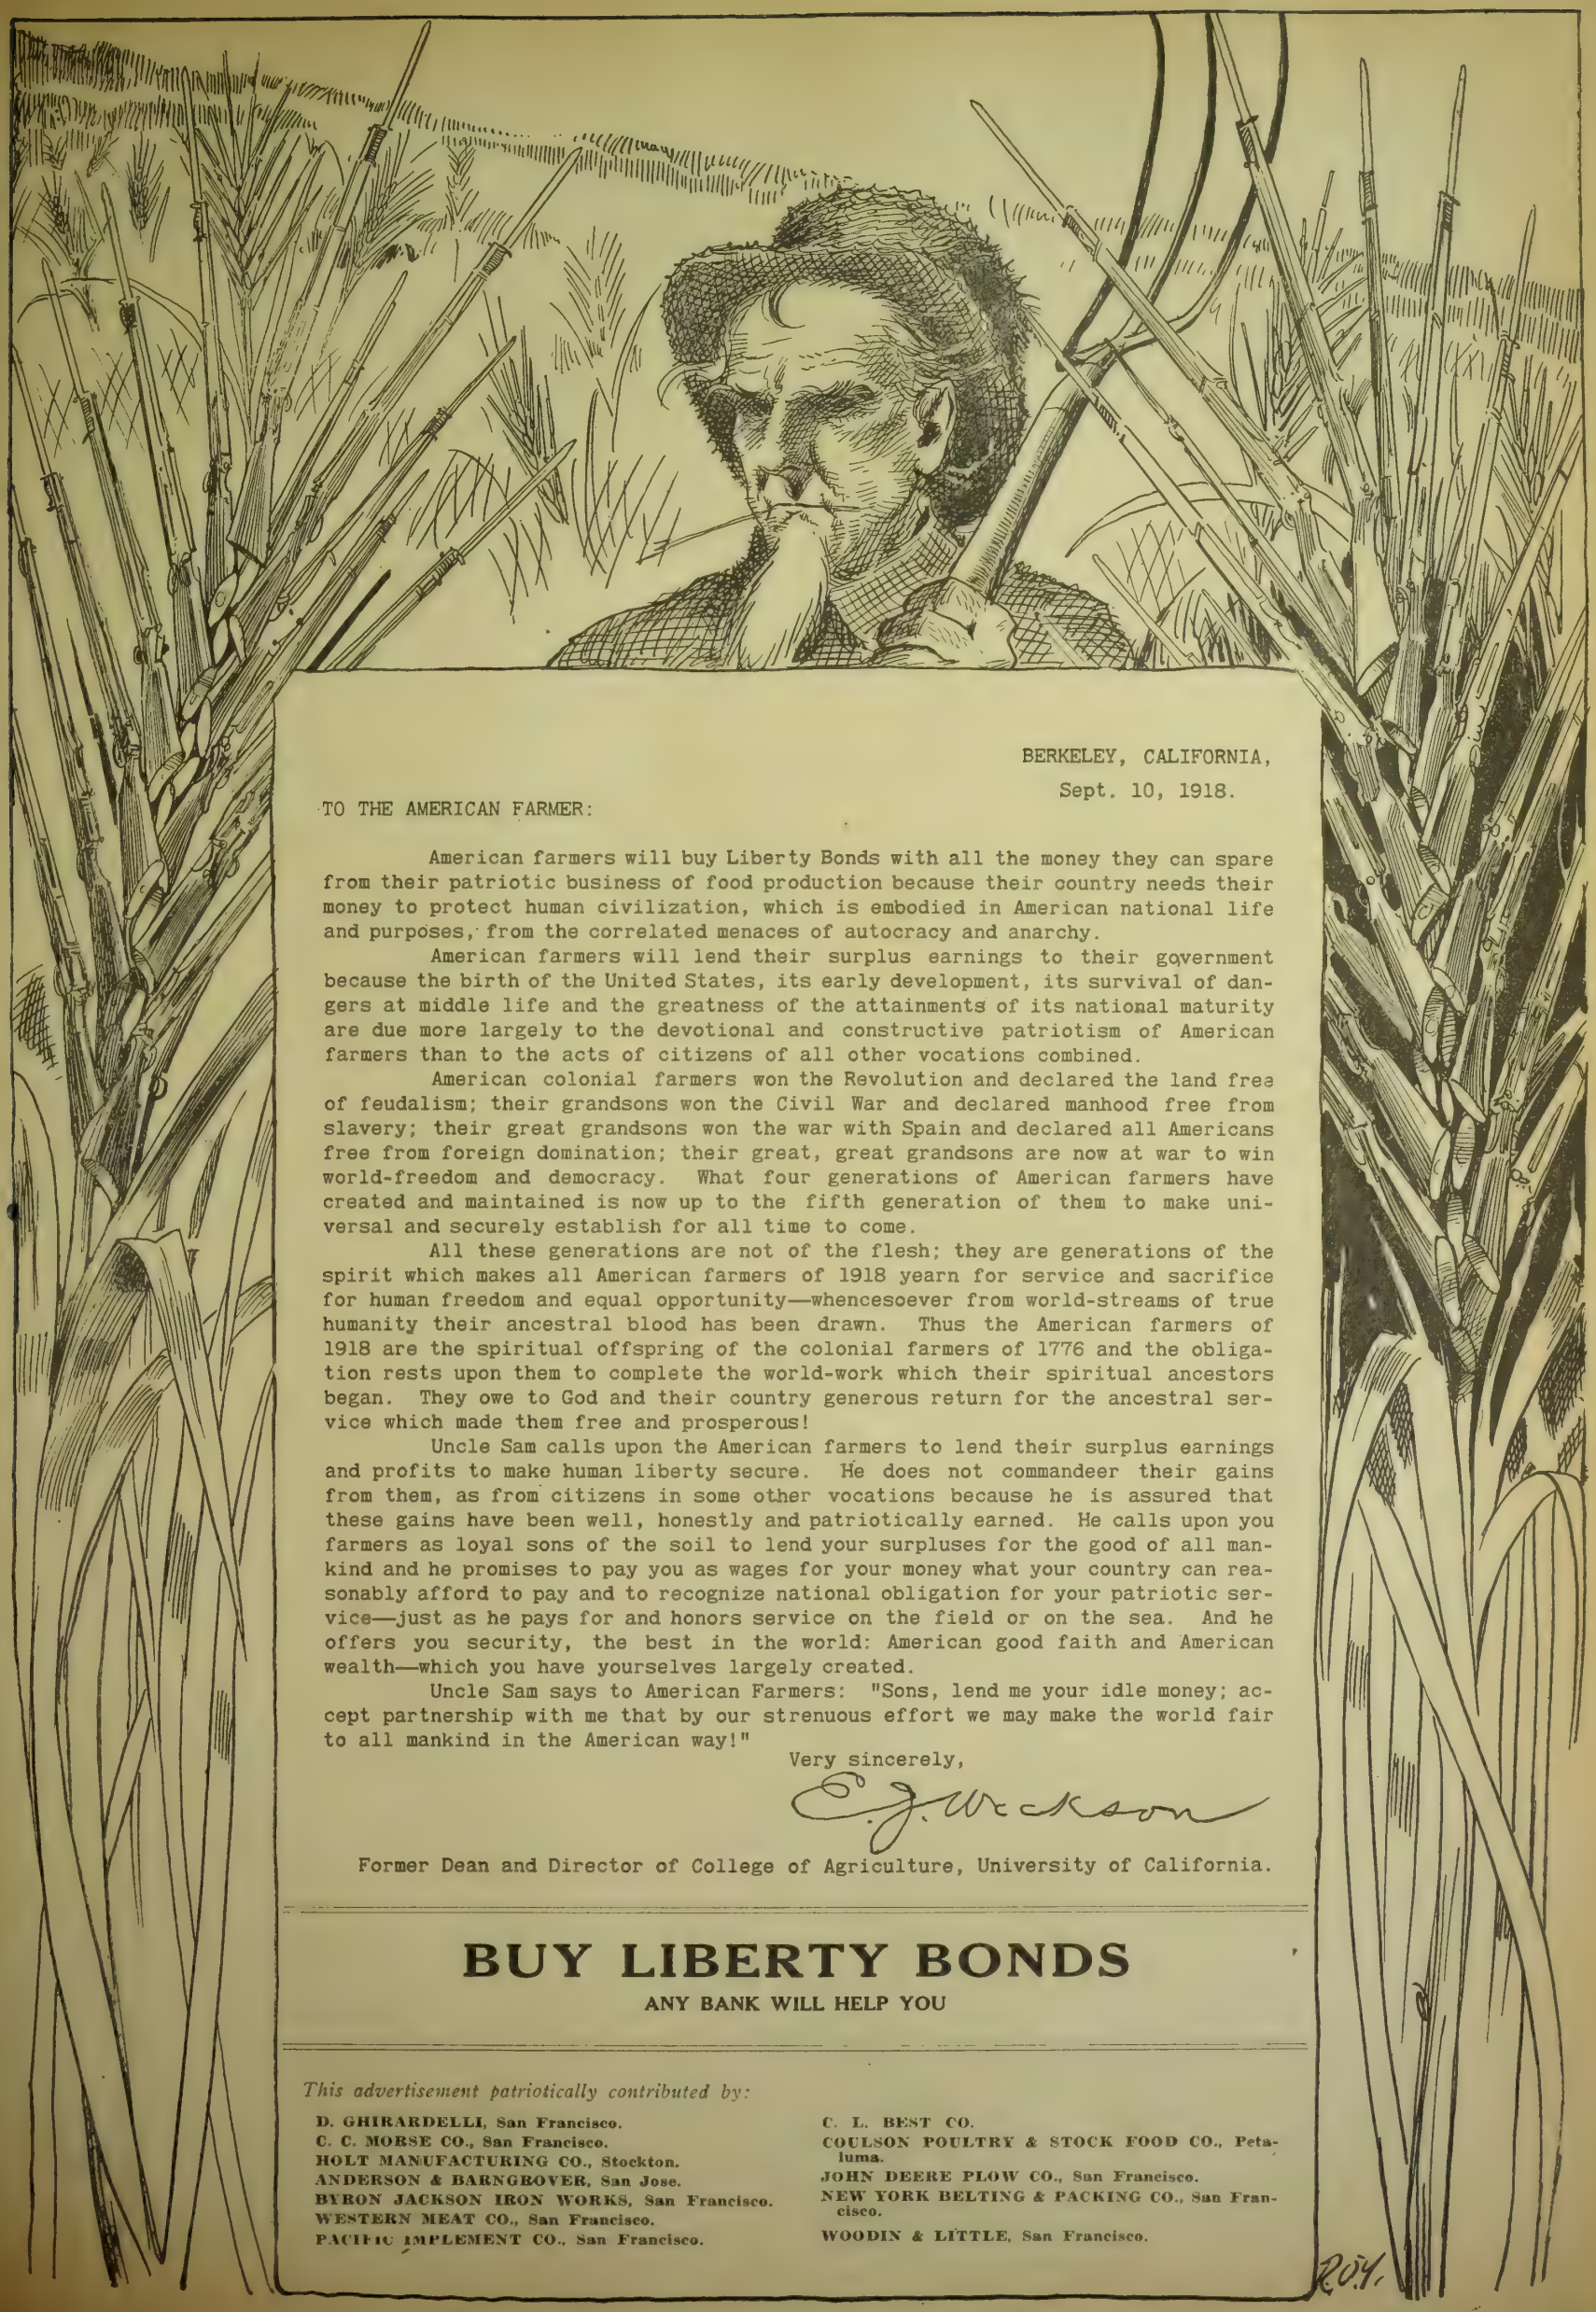
The Trundaar 20-35, several of whose track links broke at the Davis demonstration because a mistake had been made in tempering them, has had no trouble since, and was one of three tractors which pulled their load (three 14-inch plows for the Trundaar) over a 57 per cent grade at the Pullman, Wash., demonstration. One of the recent changes in the Trundaar is that the track guides by which track links were formerly kept in line have been abolished and a piece of hardened angle iron is now inserted under each shoe and beside the links, its free side being ready to rub against the truck wheels to keep the track aligned. The other material change is that whereas the drive wheel formerly was a solid casting, now its hub is cast separate and a circular disk is bolted onto each side of the hub to finish the wheel. Thus if any breakage occurs it can be replaced with least expense. An 8-16 Trundaar will be run at the Los Angeles demonstration.

Monarch Track Features.

Four Monarch tractors on exhibition created much favorable comment. These machines, having no tiller wheels, turn by retarding the track on one side or the other. They have extra long tracks of sturdy construction. The weight of the machine balances on a central axle, which rests on a frame, with three pairs of trucks on each side. The weight rests on bronze saddles on the axles of the truck wheels, in such a way that any wear only makes them fit better. The saddles can be replaced in fifteen minutes. They are enclosed in a dust-proof box and packed with waste, which is lubricated through an oil cup. The drive teeth in the track are so spaced that they are not touched by the drive sprockets until the latter have fitted in full depth with a slight clearance. Then, as the tooth rises on the end curve, the drive sprocket sets up against it without rubbing. The sprockets are so flanged that when worn on one side the wheel may be reversed for equal wear on the other side of the sprockets. It can then be replaced by the idler wheel and it will fill the idlers' place. The driver has a chilled face and the track teeth are of manganese steel.

Oliver Power Lift Gangs.

"Where is the Oliver Chilled Plow exhibit?" asked a business-like farmer at the State Fair. "I've just bought a tractor and the Oliver plow I've been using with horses won't do the work now." One of the Oliver men courteously showed him a four-gang plow that digs its nose into the ground when you pull a string from your seat on the tractor and stays in the ground until you pull the



BERKELEY, CALIFORNIA,
Sept. 10, 1918.

TO THE AMERICAN FARMER:

American farmers will buy Liberty Bonds with all the money they can spare from their patriotic business of food production because their country needs their money to protect human civilization, which is embodied in American national life and purposes, from the correlated menaces of autocracy and anarchy.

American farmers will lend their surplus earnings to their government because the birth of the United States, its early development, its survival of dangers at middle life and the greatness of the attainments of its national maturity are due more largely to the devotional and constructive patriotism of American farmers than to the acts of citizens of all other vocations combined.

American colonial farmers won the Revolution and declared the land free of feudalism; their grandsons won the Civil War and declared manhood free from slavery; their great grandsons won the war with Spain and declared all Americans free from foreign domination; their great, great grandsons are now at war to win world-freedom and democracy. What four generations of American farmers have created and maintained is now up to the fifth generation of them to make universal and securely establish for all time to come.

All these generations are not of the flesh; they are generations of the spirit which makes all American farmers of 1918 yearn for service and sacrifice for human freedom and equal opportunity—whencesoever from world-streams of true humanity their ancestral blood has been drawn. Thus the American farmers of 1918 are the spiritual offspring of the colonial farmers of 1776 and the obligation rests upon them to complete the world-work which their spiritual ancestors began. They owe to God and their country generous return for the ancestral service which made them free and prosperous!

Uncle Sam calls upon the American farmers to lend their surplus earnings and profits to make human liberty secure. He does not commandeer their gains from them, as from citizens in some other vocations because he is assured that these gains have been well, honestly and patriotically earned. He calls upon you farmers as loyal sons of the soil to lend your surpluses for the good of all mankind and he promises to pay you as wages for your money what your country can reasonably afford to pay and to recognize national obligation for your patriotic service—just as he pays for and honors service on the field or on the sea. And he offers you security, the best in the world: American good faith and American wealth—which you have yourselves largely created.

Uncle Sam says to American Farmers: "Sons, lend me your idle money; accept partnership with me that by our strenuous effort we may make the world fair to all mankind in the American way!"

Very sincerely,

C. J. Wickson

Former Dean and Director of College of Agriculture, University of California.

string again, when it lifts itself clear out. The string pulls a "dog" ratchet which engages an eccentric which does the work by means of a crank axle. When the front of the plow frame rises, a rod raises the rear end also. An adjustable lug on the crank axle catches against the plow frame while plowing and holds it at any set depth until changed. Adjustable levers set the moldboards level whenever the lug and depth of plowing are changed.

Deere Plow Lift Disk Plows.

The John Deere Plow Co. has long been making power lift moldboard plows, but very few people in California know of their rather recently marketed power-lift disk plows. These are made in three, four, and five gangs and 24 and 26-inch disks. Each disk is on a separate beam, which may be inserted anywhere between the front and rear bottoms or taken out from between them if a specially hard job of plowing is ahead. They have heavy Montana disk bearings. The disk plow is bolted to a cast disk half its diameter. The casting has a round-pointed cone cast on its center to project into the cast cap which forms the standard. The cap has a collar around its open end which fits against the cast disk. A plate fits over this collar and bolts to the cast disk. The hub and its cap boxing are made of the hardest steel.

Worm-Gear Bearcat Tractors.

The Galloway Co. of Waterloo, Iowa, was just getting ready to market the new Bearcat tractors in the Middle West when W. J. Burt of Los Angeles happened to hear of them. Mr. Burt, with ten years of experience at auto and tractor repairing, soon made a deal to handle the tractor on the Pacific Coast. Two Bearcats were shown at the State Fair. They have four wheels fitted with Timken bearings, a full floating axle at the rear, driven by a worm gear. Mr. Burt examined a worm gear from a Bearcat that had plowed 1400 acres and it showed no wear. An impulse starter is part of the equipment.

Holt Tractor Disk on Wheels.

A unique tractor double-disk cultivator has been put on the market for the first time this summer by the Holt Mfg. Co. It is the invention of J. H. Davis, whose plows the Holt people long ago adopted. The disks are made in eight and ten-foot lengths, hung on a heavy frame, which runs on four broad low wheels. They are not broken in the middle like common disk cultivators, but each section is on a stiff anxle, the rear section being clamped to the frame at an angle to the front one. The front end of the frame is raised and lowered by lever and a vertical standard resting on a ball and socket on the axle like the rear end of Caterpillar plows. The rear end of the frame is raised and lowered by a crank axle and a worm gear which locks it at any depth desired. The disks are raised entirely free for movement on the roads.

Bean Tractor Improvements.

Little troubles which have afflicted some Bean tractor users have been eliminated by several recent improvements. The drive sprocket ring, which was formerly easily worn out, is now machine cut and hardened by baking 12 hours in a pack of hardening materials. Equipment for this work has been installed and all other gears in the transmission are similarly hardened an eighth of an inch thick, leaving a core of tough steel within the hardened coat. One of the sprocket rings, after being in river bottom service three months, did not have the tool marks all worn off. A fiber thrust washer at the end of the Hyatt roller bearings in the trucks which carry most of the tractor's weight proved too soft. They wore out and the bearings then soon wore themselves loose. Steel thrust washers have eliminated this. The machine was formerly hand-governed by the throttle. An automatic governor has been installed. A force pump of greater capacity at high speed has been installed for engine lubrication. A dustproof cap has been placed over each hub, and the hubs are fitted with removable gray iron bushings. The NU4 Bosch magneto, which formerly divided each spark for two cylinders, has been replaced by a DU4 Bosch, which gives a full spark to each cylinder. This eliminates the formerly weak spark, which sometimes failed to burn all the distillate, letting it pass the pistons into the lubricating oil with resultant bearing troubles. All of these improvements can be installed on the old Bean tractors at a reduced price for three months, after which the prices will rise.

The Case Union Suit.

The Case "union suit" 9-18 tractor exhibited at the State Fair is a recent accomplishment in making the crank and transmission cases of a tractor serve as its frame. The union suit is a malleable semi-steel casting with proper compartments for crank case, transmission, differential, etc. The machine weighs less than its predecessor, has a 68-inch wheel base and is low, compact, and powerful. Only four shafts and gear reductions are used. The motor, being crosswise, eliminates bevel gears and the consequent thrust bearings. The first of these models came in June.

Lauson Tractors by De Laval.

Lauson tractors were first put out with a two-point suspension on the front axle and brace rods to help reduce the strain. Recently they have been put on a one-point suspension in front so the front axle can rock and the wheel can run over a big obstruction without twisting the frame. These are handled by the De Laval Dairy Supply Co. and local agents. They are made by the same people back East who make the

Raynster for Protection

Raynster is the family name of a complete line of weatherproof coats. Raynsters include coats for men and women, girls and boys, in all kinds of materials, at a wide range of prices.

Heavy rubber-surfaced work coats; warm, ulster-like coats for cold and rainy weather; imported cloth coats that are worn as overcoats; light slip-ons; school coats for youngsters—all these bear the Raynster quality label. Look for this label—be sure it is in the raincoat you buy. It is your protection. It assures good materials and fine workmanship and the best value for your money.

Write to us for a Style Book with illustrations and descriptions of the different kinds of Raynsters.

New 12-25 Best Tracklayers.

The C. L. Best Co. dealers are taking orders for October delivery of a new-sized Tracklayer, the 12-25. This is a successor to the 8-16, which has been tried and abandoned during the four years' experiments which resulted in the new machine. It is designed and built to plow its own width, 46 inches. It is 51 inches high, 10 feet 5 inches long, drives and steers by tracks alone, and has the regular C. L. Best features.

Cleveland Gear Rings Separate.

In Cleveland tractors the big driven internal gear ring used to be cast as a part of the drive sprocket wheel. They are now made as separate hardened rings to be bolted or riveted within the drive sprocket so they may be more cheaply replaced in case of wear. Track pins have been enlarged and they run through removable bushings tightly fitted into the track links with a loose bushing around them for the sprocket wheel to work on.

New Alling Track Type.

A new and diminutive track-type tractor appeared at the State Fair, August 31. It is the "Alling" 7-15-horsepower machine, about seven feet long and four high, with the big drive wheel in the center of the track and truck idlers in front and behind the driver. The engine runs 1000 r. p. m. It has a double chain drive.

Killefer Cultivators in Demand.

G. A. Flood reports that the Balfour-Guthrie people of Brentwood drove up to Sacramento to give him an order for five five-standard Killefer subsoilers to use behind their 75-horsepower engines. Mr. Wheeler of the Peters-Wheeler Seed Co. of Gilroy came up to buy two extra heavy duty Killefer eight-foot tractor cultivators to break up refractory adobe. Ranch Superintendent R. L. Merchant of the Pacific Sugar Corporation at Tracy reported using an extra heavy Killefer tractor chisel about 18 inches deep in refractory clay which had never been plowed over four inches deep. The 90-horsepower tractor had to run in low gear to get through. The Sugar Corporation has since bought another.

Moline Drivers Sit on Implements.

The three Moline tractors used at the Davis demonstration were brand new and were the first three of the present model built by the factory. They work better after being more carefully broken in. Few troubles have been reported by Moline users. These are two-wheeled 9-18-horsepower tractors balanced by the implements they pull and on which the operators sit. A Moline tractor at the Fair was mounted on a wheel so it could be swung around and connected to any one of six or seven different implements. On one of these a variety of tillage tools may be hooked at different times to the same drawbar. This enables the vineyardist to use two two-gang plows far enough apart to plow toward the vines of two rows at once, then set them closer together for the centers, returning on good footing. The centers may be plowed toward center equally well.

New Two-Track Steel Mule.

The new model Bates Steel Mule double track 12-20-horsepower tractors are now available for delivery in any quantity likely to be required. This machine, unlike its awkward predecessor, is built compact and close to the ground. It weighs 4300 pounds, is 52 inches wide and 105 inches long, and is equipped with Timken bearings throughout. The heavy cast body for crank case and transmission gears and the heavy track are features of the machine.

Garden Tractor and Tools.

On the Beeman Garden tractor the action of its internal gear drive formerly tended to push the small truck wheels behind the drivers into sand or soft ground. This is overcome now by setting those wheels far enough back of the tractor so the leverage has no serious effect. The H. V. Carter Co., who handle

LAYNE & BOWLER
Turbine Centrifugal Pump

Always in the lead in introducing features that effect bigger savings in time, trouble and money to the pump user, Layne & Bowler Corporation announces the introduction of a number of important refinements. Full information regarding new construction given in Folder No. 25. Ask for it.

Layne & Bowler Corp.
900 Santa Fe Ave., Los Angeles.
Bakersfield, Fresno, San Francisco.

THE SELF-OILING WINDMILL
has become so popular in its first three years that thousands have been called for to replace, on their old towers, other makes of mills, and to replace, at small cost, the gearing of the earlier Aermotors, making them self-oiling. Its enclosed motor keeps in the oil and keeps out dust and rain. The Splash Oiling System constantly floods every bearing with oil preventing wear and enabling the mill to pump in the lightest breeze. The oil supply is renewed once a year. Double Gears are used, each carrying half the load. We make Gasoline Engines, Pumps, Tanks, Water Supply Goods and Steel Frame Saws.

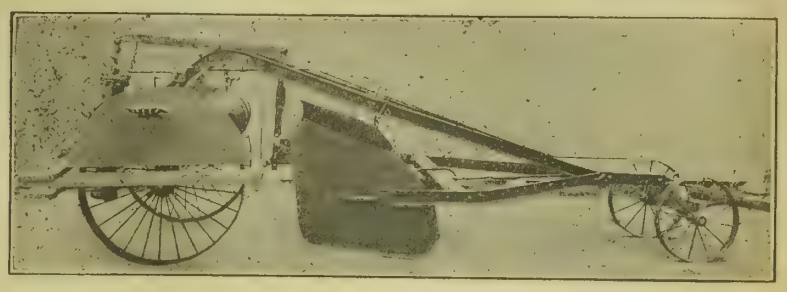
We Manufacture Levelers for Any Power From 6 Horses to a 75 H. P. Tractor

A Schmeiser Leveler
of the "Giant" Type
WILL WORK WONDERS ON YOUR FARM



Moving immense amounts of dirt daily, and working on ground too tough for horses and Fresnos to tackle, SCHMEISER POWER LAND LEVELERS are now being used with utmost success by a great many ranchers, large and small—also by contractors—saving their owners time, labor and money.

WE SEND THEM ON THREE DAYS' TRIAL.

So extremely simple, a child could operate one, as a simple twist of the wrist raises and lowers the bucket or holds it stationary, as the case may require.

YOU SHOULD
send for our latest catalog, J-600, which is full of interesting information on Labor Saving Devices and machines for moving the earth.

Two Generations of Tractor Builders

C. L. BEST GAS TRACTION COMPANY
SAN LEANDRO, CAL.

this machine, have also the Genung three-row seeder, especially adapted to the Beeman tractor, so three rows 9 to 18 inches apart may be planted at once or two rows up to 36 inches apart. Thos. Landrum recently ordered three for the San Juan Batiste ranch. A divider to separate matted bean rows, etc., in front of the tractor may now be bolted onto the front of its frame. An 8-tooth duckfoot cultivator is available for use with the tractor to stir subsurface soil thoroughly without ridging the surface. The Beeman tractor develops four horsepower on the belt and 230 pounds pull on the drawbar, using less than two gallons of fuel in ten hours.

Wallis Tractor Exhibit.

The Wallis tractors attracted visitors by three features, (1) a tractor and plow painted white and gold and mounted on a black platform, (2) a tractor with the entire top loosened from its crank case steel plate frame, showing great simplicity of its transmission and engine, and (3) a tractor with handholes opened, the inside lighted, and cylinder head turned back, with electric lights connected to the spark plugs. An electric motor turned the engine slowly, flashing the lights as the spark plugs would naturally fire.

Schmeiser Land Levelers.

The Schmeiser Mfg. Co. showed two of their power land levelers. One 8 feet wide is lifted by a handwheel and screw operated by a man on a platform between the wheels behind the leveler. The other one cuts 12 feet and is operated by compressed air from a pump on the tractor.

Baker & Hamilton.

A large and striking exhibit of various sizes and kinds of P & O tractor gang moldboard and disk plows and a big middle buster featured the exhibit of Baker-Hamilton & Pacific Co. Several disk cultivators, including the P & O tandem attachment, a couple of Western pulverizers, one of them in three sections, to work a strip 20 feet wide, and a spring-tooth harrow completed the array. The Imperial engine disk harrow, of which many are being used in the rice fields, was a feature. Each gang has its own subframe, which pivots centrally on a vertical axle through a boxing on the heavy main frame. The implement cuts about 80 inches wide, rear gangs cutting between the forward gangs so that all the soil is cut up and refined. The forward and rear gangs on each side are attached to each other so one lever on each side sets the angle. Each gang has three bearings of hard maple.

Dairy and Milking Machines.

Milking machine exhibits comprised about half of the dairy machinery at the State Fair, and De Laval Dairy Supply machinery comprised the other half, with a cement-stave silo exhibited by J. S. Copley forming a landmark for all. The De Laval exhibit attracted great attention with several machines in motion. It included De Laval separators, several Alpha gas engines, one operating a Viking rotary pump, Acme feed choppers and silage cutters, including a blower pipe with jointed distributing pipe attached, James barn equipment, a Babcock tester, and miscellaneous dairy supplies, besides a small silo. The Calfway milking machine exhibit included their white cow with the machine sucking. The Perfection milking machine brought out much favorable comment. The Hinman milker attracted attention by its moving machinery. The Empire people showed engines, pumps, and separators, besides milking machines. Surely the dairyman, tired of hiring new milkers, here had a chance to select a machine which does not strike for higher wages and which works safely and satisfactorily indefinitely if given decent attention.

Ford Tractor Attachments.

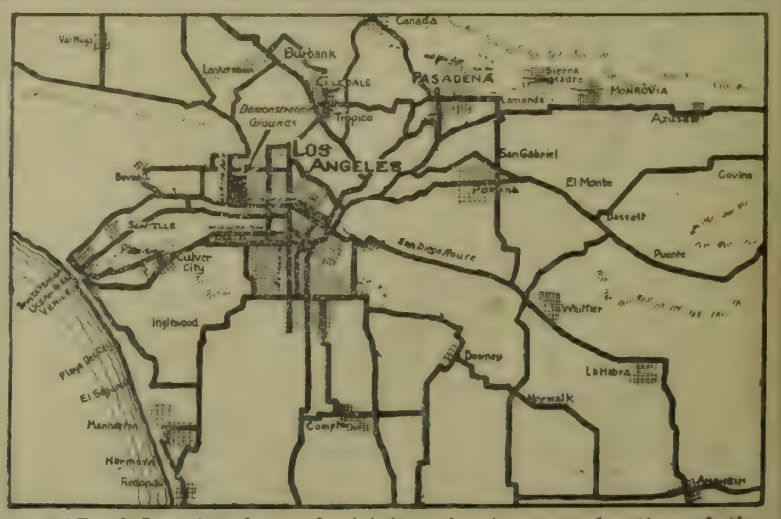
The Los Angeles Auto Tractor Co.'s Little Bear tractor attachment and the Staude Mak-a-Tractor were two well-known devices for converting Ford cars into tractors, and they attracted much inquiry. People who have old Fords with good engines may have tractor attachments at small cost.

Schools for Tractor Operators.

Learning to operate a tractor intelligently in the shortest time requires special facilities such as cannot be found on any farm; and needs many makes of tractors to illustrate the points made. Two schools devoted to this purpose had exhibits at the Fair. They were Heald's Engineering and Automobile School of San Francisco and the National Automotive School of Los Angeles.

Pacific Implement Co.

A 10-foot Farmers' Favorite grain drill, easily adjustable to any desired capacity, Pacific and Janesville double disk engine harrows, Sanders power-lift disk gang plows, South Bend power-lift moldboard plows, and a Smalley feed and silage cutter comprised the exhibit of the Pacific Implement Co. One of the features of the Smalley is the safcty device which stops the knives instantly when a foreign substance gets in. Their grip hook feed is an advantage also.



MAP of Los Angeles and vicinity, showing new location of the demonstration grounds of the Traction Engine and Implement Dealers' Association of Southern California. The location has been moved from the previously announced 350 acres on Whittier boulevard to a 500-acre site on Wilshire boulevard and La Brea avenue. Over 60 acres of tents and temporary buildings are being filled with the greatest exhibit of modern farm machinery and equipment that has ever been brought together west of the Rockies. Street car and bus service to grounds, admission free, parking space free for thousands of automobiles, superb highways to the grounds, rest rooms, restaurants, telephones, refreshment parlors, lectures and demonstrations by tractor experts, and the best chance ever of making yourself up to date on farm machinery.

ANNOUNCEMENT!

We, B. G. DOAK and C. K. DOAK, formerly owners of Standard Cor. Pipe Co. and Am. Cor. Culv. Co. wish to announce that we have formed a Corporation known as the

Doak Tractor Company

for the distribution of farm tractors in California. We have done this after a thorough study of the tractor situation for the past year, having always in mind a tractor that would be the most **PRACTICAL** for this territory and which would give the greatest amount of **EFFICIENCY.** The **INTERSTATE TRACTOR CO.**, of Waterloo, Iowa, knowing of our many years' experience with conditions in California, invited us to take the California agency for their tractors. We welcomed their suggestions, but made no decision until we felt that we could recommend and conscientiously distribute a tractor which is the best on the market and will give the greatest **SERVICE** and **ECONOMY.**

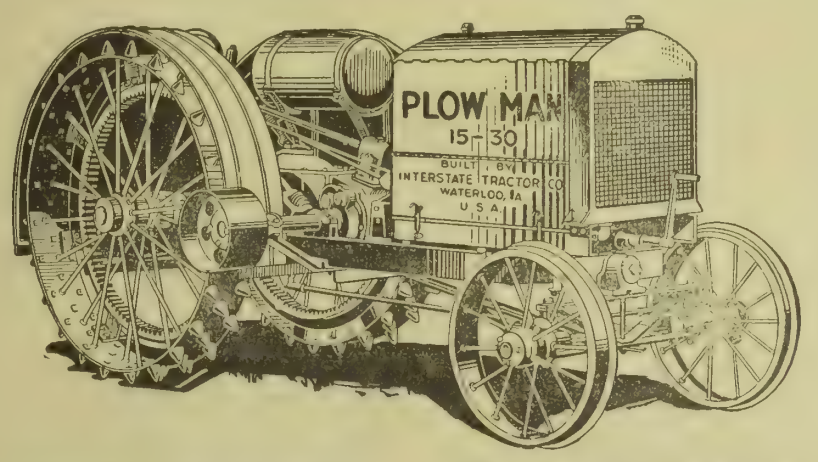
The New 1918 PLOW-MAN 13-30 and 15-30

Marks the greatest step in **RESERVE POWER,** refinement of construction and finished details.

Burns either Kerosene or Gasoline.

Correctly designed ALL STANDARD PARTS.

Motor, 4 cylinder (Oversize)
Controls, Rear Drive Type
Traction, Chassis on four wheels
Transmission, unit with motor
Cooling System, (Oversize), 8½ gals.
Front Axle, Oscillating Type.



MODEL 15-30 PULLS FOUR PLOWS. MODEL 13-30 PULLS THREE PLOWS.

Correctly designed ALL STANDARD PARTS.

Clutch, Multiple Eight Dry Discs
Buda Motor
Bennett Carburetor
Dixie High Tension Magneto
Foote Strite Transmission
Perfex Radiator
Hyatt Bearings
Turning Radius, 15 ft.

Farmers have learned in the past few years that satisfactory work from a tractor demands **EXCESS OF POWER.** The machine rated at full capacity is overloaded and therefore soon worn out. The only tractor of permanent value is that one combining **HIGH QUALITY OF CONSTRUCTION** with plenty of reserve power. **PLOW-MAN** tractors are of simple construction, making it possible for a boy to handle them. In rating the horse-power of these tractors they have provided for a one-third reserve power, which means that under a normal load these tractors have a **ONE-THIRD RESERVE POWER** for all emergencies, and which assures a long life to the tractor. From an economy standpoint the **PLOW-MAN** is establishing some wonderful records in the states of Kansas, Iowa, Illinois, and Nebraska.

PLOW-MAN TRACTORS

Have an established record for:
Smooth operation
Easy handling
Fuel economy
Very low up-keep costs
Long life of tractor
A satisfied owner.

- SEE -

Plow-Man Tractors

Operate at

Los Angeles Demonstration September 17th

LIVE AGENTS WANTED

SERVICE

We have installed a parts department with a full supply of PLOW-MAN parts, which insures immediate service to the PLOW-MAN owners. This is a feature which has been one of the drawbacks in the tractor business and should be given serious consideration by the prospective buyer when about to make a purchase.

If PLOW-MAN TRACTORS are not represented in your territory here is your OPPORTUNITY. Invite us to submit our proposition, it will interest you and our first carload of PLOW-MAN TRACTORS is here. We invite your inspection.

Fair Reveals California's Opportunities

(Continued from first page.)

DAIRY CATTLE.

Probably dairymen have felt the labor shortage more than any other farmers, and on this account some of the customary exhibitors were unable to show this year. But the dairy cattle made up in quality what they lacked in numbers, and F. L. Scribner of Pasadena, who placed the awards, was loud in his praise of the stock shown.

The Bridgfords were justly proud of their grand Holstein bull, King Segis Alcartra Prilly, not only because he defended his honors successfully and was again made grand champion, but particularly because several of his get were placed high, including the junior champion heifer, the first senior heifer calf and the first junior heifer calf.

A mammoth silver cup was offered by the State Jersey Breeders' Association for the best five cows in milk, to be held by the exhibitor winning it the greatest number of times in five years, and was won this year by J. E. Thorp.

BEEF CATTLE.

Enthusiastic commendation of the quality of the beef cattle was given by the judge, John E. Robbins of Horace, Indiana, who for years has been a most successful breeder of beef cattle and has frequently judged at the big eastern shows. He was particularly pleased with the quality of the animals shown and the size for their age. "A few seasons ago I judged at the Illinois State Fair," he said, "and I must say that the animals I passed upon today compared favorably with anything I saw at that show."

The Shorthorns were there in good numbers and Count Glory, the Carruthers bull who was grand champion last year, won the same award this year.

Two years ago there was only one Hereford entry; last year there were four entries; this year five. J. A. Bunting of Mission San Jose landed both grand championships as well as several championships and other awards.

SWINE.

At the hog barns we shook hands with nearly all of the old familiar faces, and there were several new breeders who not only showed but received a large number of awards. Nearly all classes were well filled and competition was keen. Prof. L. B. Weaver of the University of Missouri judged Durocs and Poland-Chinas; J. L. Thatcher of Riverside, Berkshires; and Prof. J. I. Thompson of the University Farm, Hampshires, Chester Whites, Yorkshires and Mule Foots.

The Berkshire breeders sprung an innovation by having Judge Thatcher announce his reasons for placing the awards, and the plan worked so well that we want to say more about it in a later issue, as it is one which should be universally adopted.

SHEEP.

Prof. R. F. Miller of the University Farm judged the sheep. There was a large showing of Rambouillets by Bullard Bros., and Shropshires by Bishop Bros. Hampshires, Dorsets, Romneys and Corriedales also were shown.

Bullard Bros. had on exhibition the Rambouillet ram for which they paid $3,000 at the recent Salt Lake sale. He was bred by the Butterfield Livestock Co. of Weiser, Idaho.

DRAFT STOCK.

Some of the largest breeders of draft horses were unable to secure adequate help to condition their stock and did not show. Also the war has interfered with the importation of stock from Europe, and most of the animals shown were of domestic breeding.

However, here, as elsewhere, the quality was good, and John E. Robbins of Horace, Indiana, who judged draft stock as well as beef cattle, was very favorably impressed with the showings made.

SECOND MODESTO SALE

80 Registered 80

Holsteins

MODESTO, CALIFORNIA

Thursday, Oct. 17, 1918

A splendid offering of young cows, heifers, and bulls. This sale contains something of interest for almost any kind of a buyer. Owing to the dispersal of the C. G. Outland herd there will be several choice young heifer calves that will be a bargain for someone. They are all sired by the 30 pound bull, **HUBBAVALE ARTIS TWISK NETHERLAND**, who will himself be sold, and all of Mr. Outland's choice cows and heifers are bred to him.

The **27.89 POUND SHOW COW, Potoki Johanna 2nd**, in calf to a 29 pound son of Prince Gelsche Walker, will be sold, and she is a beautiful cow as well as a great producer.

The **23.06 POUND SENIOR 4-YEAR-OLD, Dora Hengerveld of Sylvan Iris**, bred to a 29 pound son of Sir Chimacum Wayne, will go to the highest bidder, and she is an excellent individual.

There will be choice breeding cows, many of them fresh or heavy springers, bred heifers and unbred heifers, good clean cattle, of popular breeding.

There will be at least three young bulls in the sale that are qualified in every way to head first class registered herds.

There will be a number of highly bred bulls of type and breeding entitling them to places at the head of the best dairy herds.

Every animal tuberculin tested and sold subject to tuberculin retest, and guaranteed to be a breeder.

Catalog now in preparation. Write for one.

SACRAMENTO - - CALIFORNIA

Auctioneers—Col. Ben A. Rhoades, Los Angeles; Col. Cy N. Clark, Modesto.

First Prize Get of Sire

AT SACRAMENTO

The get of Prince Riverside Walker combine show type with great production backing. The cow making the highest official yearly butter record for 1917-1918, as shown by the report just issued by the Holstein-Friesian Association of America (and it is the world's official record for one year), is Aaggie Acme of Riverside 2nd. She is out of the same dam as our senior herd sire, **PRINCE RIVERSIDE WALKER.**

The junior three year old heifer making the highest yearly butter record for 1917-1918, as shown by the report just issued by the Holstein-Friesian Association of America, is Miss Valley Mead De Kol Walker. She is by the same sire as our senior herd sire, **PRINCE RIVERSIDE WALKER.**

Buy your herd sire in the blood lines that are doing things **TODAY** and that will increase in value in the records they are bound to make in the **TOMORROW.** We have just a few good bull calves by **PRINCE RIVERSIDE WALKER,** out of splendid dams. They move young at our prices.

OUR ENTIRE HERD IS TUBERCULIN TESTED.

Tulare Holstein Farm

Complete Dispersal

at private sale of the well known

Bella Vista Registered Herds

Guernsey Cattle Hampshire Swine

These herds are the result of years of careful breeding and selection and have won high honors in the show-ring and for production as well.

GUERNSEY sires used: (1) **Imported Lord Kitchener No. 11369,** many times grand champion of California, sire of Kitchener's Dainty Lass with a record of over 700 lbs. butterfat; (2) **Wanegan,** junior champion at State Fair; (3) **Glenburnie Boy,** whose dam made 13559 lbs. milk; 684.8 lbs. butterfat as a three-year-old; (4) **Sir Elsie Masher of Glenburnie.**

Among the foundation cows is **Clementine Mabel,** who made 558 lbs. butterfat at 13 years of age, and **Rancho Morning Rose,** who stood 7th in her class in the U. S.

Herd consists of 16 females, 2 herd bulls and bull calf.

HAMPSHIRES—Foundation 1911 boar and 2 gilts, won both grand championships, State Fair, 1913. Herd consists of 2 boars, 4 brood sows and young pigs.

Having sold my ranch, must dispose of the stock at once. Interested parties can see me at the ranch Thursdays and Sundays or at any other time by appointment.

THE BULLARD TYPE
Rambouillet Sheep
Again Awarded All Prizes at the 1918 State Fair

A Bullard Yearling Ram that sold for $1000 at the Salt Lake Ram Sale.

A pen of Bullard Range Rams brought the highest price ever paid in America. We purchased a ram for $3,000 conceded by Prof. Coffey to be the best Rambouillet in the United States, for use in our flocks.

The Bullard kind are the kind to own. They produce wool and mutton at the lowest cost.

Single Animals or Carload Lots.

BULLARD BROS. **Woodland, Cal.**

Champion Ram, P. P. I. E.

SAN RAMON SHROPSHIRES

My Range Bulls are Shorthorn Show Bulls

All of them have been at the Fairs and have generally won something. Their get are uniform, vigorous, and hardy, raised to service age on the range. King Lancaster, three times Grand Champion at the State Fair and now 13 years old, is still getting fine calves. My bulls won Grand Championships every year for eleven years (1904 to 1914, inclusive), except 1907, when I showed only calves. I have a breeding herd of 400 cows and can supply service bulls in car lots, but they are going fast. Write me your wants pretty soon or come and see.

Shropshire and Merino Sheep also for sale in any quantity

The Cost of Feed is NOT HIGH

when you mix your rations with COPRO, the economical COPRO. For nourishing cattle and conditioning poultry it has no superior.

Copro

is rich in fats and protein. It makes hens lay more eggs; it increases butter fat in milk; it makes hogs fat with clean flesh.
Mix COPRO with your rations and watch the results.

FREE SAMPLE and a copy of our booklet containing valuable information on the subject of "SUCCESSFUL FEEDING" gladly sent on request. Write today.

If your DEALER can't quote prices write us direct.

JERSEYS The PROFIT BREED

The pump has been blamed for much watered milk that really came from poor cows. Why waste feed on cows that skim their own milk when Jerseys will produce the highest percentage of butter fat at the lowest feed cost. **Raise the standard of your herd to the highest degree with Jerseys.** The man who begins with one Jersey is never satisfied until he has a herd. He can see the profit without close figuring. Start now. Write to Breeders for pedigrees and prices. Let us send you the Jersey facts that will open your eyes to the possibilities of this money-making breed.

THE AMERICAN JERSEY CATTLE CLUB, 388 West 23rd St., N. Y. City

Get one of my Jersey bulls to increase the production of your herd. They are rich in the blood of the great cow,

GERTIE OF GLYNLLYN.

Holstein Heifers

Buyers who want choice registered Holstein heifers should not fail to investigate the offering that will be made when we disperse the W. H. Ginn & Son herd at

CORCORAN, CALIFORNIA
Thursday, Oct. 10, 1918

Ginn & Son spared no expense when they bought their foundation stock, choosing big, straight breeding animals of high class breeding, and the herd has constantly been improved through the use of well chosen sires. There are few herds of equal size that can show as desirable a lot of heifers as will be found in this sale. Among them are

24 DAUGHTERS OF MERCY SIR PONDYKE, who is by one of the best sons of King of the Pontiacs and out of a 23.39 pound dam.

25 DAUGHTERS OF ARALIA DE KOL PONTIAC SALAMBO, who is by a son of the former world's record cow, Aralia De Kol, and out of a daughter of King Mead of Riverside that recently finished a year with 22097.8 lbs. milk and 950 lbs. butter. The three nearest dams of this bull average over 30 lbs. butter in 7 days and over 1000 lbs. in one year.

A Large Number of

Fresh Cows and Heavy Springers

are in this sale, and 34 cows and heifers are bred to Aralia De Kol Pontiac Salambo, mentioned above, and he himself will be sold.

A TOTAL OF 90 HEAD constitutes this offering, every animal guaranteed to be a breeder, tuberculin tested and sold subject to tuberculin retest unless otherwise stated at time of sale.

Catalog in preparation. Write for one.

Two breeding animals, under four years, produce of same jennet: Yost on Califa.

ROEDING ASKS SUGGESTIONS FOR IMPROVEMENT.

After all, what counts most of all in successfully conducting a fair is to establish direct piston action between the hearts of the exhibitors and the directors, and that's just what President George C. Roeding did this year.

He went around among the exhibitors, asked them to mention faults and suggest improvements, and had his stenographer right at hand to take down notes. "We want to see things from your standpoint," he told the exhibitors. "We want to have a record of all the facts so that in preparing for next year's Fair we shall be able to comply with all reasonable requests."

The exhibitors opened up and made many valuable suggestions. They were thankfully received. And now everybody with whom President Roeding came in touch swears by him.

LIVESTOCK DIRECTORY.

SWINE

Poland-Chinas.

AM IN NEXT DRAFT, so will dispose of my few remaining brood sows; several young pigs and herd boar. Herd boar by Big Long Jumbo (227939), out of Black Big Bone Princess (589850). Poultry for Profit

By Susan Swaysgood, Pomona.

SPROUTING BARLEY.

To the Editor: B. W. M. of Redding should get four or five 50-pound lard tubs and fill them half or two-thirds full of barley, add water enough to cover it at least an inch deep and allow it to soak twenty-four hours, then draw off the water through a hole in the side slightly above the level of the inside of bottom, which is plugged with a cork of convenient size while the grain is soaking. At the end of twenty-four hours take out the cork and tip the tub over so that the water will all drain out to the last drop.

We put four or five tubs on a stand high enough to admit a pail being placed below the tub that is being drained. When drained, cover with a dry sack and let it remain until it sprouts, which will take three to five days, according to temperature of grain room.

We have sprouted oats and barley this way for years and never have any mildewed grain. The tubs are merely washed out with brush and cold water after being emptied. In very hot weather we sprinkle the wet tub with sulphur from a five-cent pepper box. The sulphur appears to drive away lice and mites if used continuously during warm weather. If the sacks begin to mildew, sprinkle them also and hang out on the fence in the sun.

It is not necessary to sprinkle the barley after being soaked twenty-four hours. To save time in examining the tubs to see if the tub to be emptied has stood long enough, we place short sticks on top of sack covers, one for each day it has stood. Cardboard tags numbered from one to five would answer, if shifted one tub ahead when an empty one is refilled and drained.—Samuel Haigh, San Jose.

A BAD CASE.

To the Editor: We moved out to a farm last February and we found the chicken house full of those large fowl ticks under the shingles and in the eucalyptus trees roundabout. We took the chicken house apart, piece by piece, and washed it with stock dip and scraped down all we could from the trees and put some dip on them. But we find that they are coming into the chicken house again and get on the chickens. Then we put kerosene on them. That killed the ticks and pretty nearly killed the hens. We don't know what to do. Please advise us. Where can I get a poultry book that tells how to take care of chickens, etc.—G. P., Denair.

[Better try sulphuring the house. First make every crack tight—clay or mud daubed around the roof where it leaks and stout paper outside over cracks in the wall. Then make a hole such as you would if you were sulphuring fruit and burn a good mess of sublimated sulphur or any strong kind; but unless you have all holes stopped up it will not do a good job. Burn it several hours, all night if possible, then throw the house open to get aired before putting the chickens back again. Send $1 to the Pacific Rural Press for "California Poultry Practice." It tells you what to do for all the ills of poultry.]

Mrs. E. F. Spooner of Saranap is hatching chickens under hens in July and August by setting them in nests made in holes in the ground and protecting the hens from the sun with burlap shades.

Dr. LeGear's Poultry Powder

Shortens the moult!

Long moulting weakens hens and *loses eggs*. Act promptly *now* and hasten Nature's course. Dr. LeGear's Poultry Powder positively will cut down the time required for moulting, strengthen hens' systems, and help you to get early layers, and

Make more Egg-Money this winter

Experiment Station tests and Dr. LeGear's years of actual practice, show that hens *need* a daily tonic during the moult. It gets them through the moult more quickly, counteracts the strain of moulting, and puts them in good condition to lay.

Dr. LeGear's Poultry Powder tones up a hen's system, improves digestion, produces a greater proportion of flesh and feathers from the feed, and stimulates the egg-producing organs. It is my own prescription, used successfully during twenty-six years of veterinary practice and poultry raising. Dr. LeGear's Poultry Powder is

Dr. L. D. LeGear, V. S. (In Surgeon's Robe) Graduate of Ontario Veterinary College (Toronto, Can.) 1892. Nationally famous specialist in treatment of stock and poultry. 26 years' actual veterinary practice.

Guaranteed to produce results

Buy a package from your dealer. If you do not believe that it has benefited your poultry, and made more profits for you, I authorize the dealer to refund your money.

Dr. LeGear's Stock Powders produce perfect digestion, drive out worms, increase growth and production.

Dr. LeGear's Antiseptic Healing Powder cleanses, drys and heals sores and cuts quickly. Handy to use, in sifter top cans.

Dr. LeGear's Lice Killer (powdered) rids your flock quickly of lice, protects chicks, etc.

Free sample—ask your dealer

Dr. LeGear's Remedies are sold by 40,000 of the best dealers—never by peddlers. Ask your dealer today for liberal *free sample* package of Dr. LeGear's Stock Powders or Dr. LeGear's Poultry Powder, and get a free copy of Dr. LeGear's Stock and Poultry Book. If your dealer hasn't the samples and books, ask him to write us for them. We will supply him promptly.

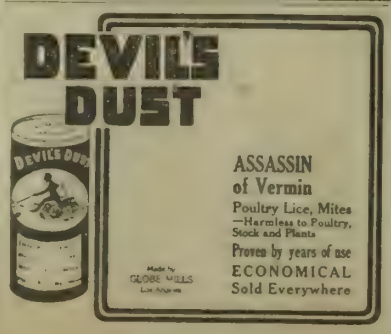
ALBERT M. HART, CLEMENTS, CAL.—Breeder and shipper of bronze turkeys.



Shorten the Molt—Hurry the Pullets

Get your birds to laying early. Keep them at it all winter. Make bigger profits than ever before. Right now, *today*, you should use

Pratts Poultry Regulator

The Guaranteed Poultry Tonic and Conditioner

It shortens the molting period by weeks, prevents loss during this critical period, makes the hens lay early and often. It brings the pullets to early laying maturity, strengthens and invigorates them for a hard winter's work.

Pratts Poultry Regulator will make *your* layers begin profitable egg-production weeks earlier than they otherwise would, keep them laying heavily and steadily during the period of high prices, protect their health, enable them to earn big money for you. *Make the test at our risk.*

Our dealer in your town has instructions to supply you with Pratts Preparations under our square-deal guarantee—"Your money back if YOU are not satisfied"—the guarantee that has stood for nearly 50 years.

HOME CIRCLE

OUR BARGAIN.

Is all our world upon a counter laid?
That is their taunt who say they know us well.
Then let us like true merchants to our trade;
What wares has God to sell?

A world at liberty, a path made clear
For steadfast justice and enduring peace,
Nations released forever from the fear
Of evil days like these.

A sound investment! but—the price is high—
Long hoarded wealth in ruin, flame and steel;
Death lurking in the sea and in the sky—
What say you? Shall we deal?

We take thy bargain, Master of the Mart.
Though we may flinch, we cannot turn away,
Send thy resistless fire upon our heart
And make us strong to pay!

—Amelia Josephine Burr.

GIRLS OF YESTERDAY.

Girls of today are a good deal alike. They learn the same lessons, play the same way, and dress in middy blouses, serge skirts, and bright sweaters. The little girls of long ago were as different as were the parts of Europe from which their colonist parents had come.

Katinka, in old Albany, was a real Dutch girl. Her flaxen hair stood out in two straight braids on either side of her white cap. Her skirts were full and short, and her wooden shoes made a loud tapping as she walked to school over the rough stones of the street. Katinka was always up long before school time, wakened by the jingle of many cow bells. There were great herds of cows in old Albany and it was part of Katinka's work to drive the cows to pasture at daybreak.

Then came breakfast of buttermilk, crullers, cheese and sausages. After school Katinka hurried home to work on the stockings she was knitting. We can almost see her, intent on her needles, seated in the stiff little garden that was bright with tulips they had brought from their homeland—Holland.

In the South, quaint little Chloe, the slender English cousin of Katinka, learned to play on her spinet and tended the roses in her garden. She wore her hair in curls and was dressed in old-fashioned flowered materials and tiny, laced slippers. She was a good little housekeeper, though, and learned from her mother how to brew home remedies from herbs, how to measure the food supplies from the big storeroom, and how to make the sweets and preserves for which the South was so famous.

Chloe was happiest, though, in the beautiful garden of the plantation where she lived. She had flowers there brought from England—hollyhocks, yellow cowslips, sweet peas, honeysuckles, and jonquils. As the little Southern girl in her ruffled sunbonnet, carrying a basket and garden shears, went from flower to flower, she looked like a blossom herself, a real part of the garden.

As Katinka knitted and Chloe picked roses, Emily, the little Quaker girl of old Philadelphia, went, in her gray cloak, on errands of mercy up and down the quaint, narrow streets of the town. Her mother liked nothing so much as packing a basket of delicacies for an ailing neighbor, and Emily always carried it carefully to its destination, walking soberly, for she had been taught that it was unseemly to run. She wore a big poke bonnet that almost hid her demure little face and she said "thee" and "thou" with great care. She could sweep and cook and spin as well as her mother, and when she had not yet reached her teens Emily had to give up school altogether to help with the work of her Quaker home.

Last of all, there was industrious little Patience, the girl of New England. She wore a long, gray frock of homespun with a white handkerchief folded over her shoulders, and a little gray cap bordered with white. Patience's brother went to school in the morning, but she was obliged to remain at home and study with her mother, as she helped spin, weave, and cook. What a wonderful little cook Patience was, though! She could stuff a turkey and make mincemeat and doughnuts. She was able to patch and quilt the warmest kind of comfortables, and she knitted all her brother's winter mufflers and mittens.

Four girls of long ago! Which will you be, or will you try to imitate the industry of all and so be the best kind of American girl?—Carolyn S. Bailey in Queen's Gardens.

BAKED FISH.

The U. S. Bureau of Fisheries has sent to this Coast women to demonstrate the best methods of cooking fish, especially the local varieties that will not stand long shipment. These women want to eliminate the high cost of living and also the bad odors of cooking. To accomplish this latter feat, instead of frying fish they bake it. Their method is to wet the prepared fish in heavily salted milk, to take the place of egg, roll in crumbs and place in baking pan with small amount of oil. Bake rather slowly and an odorless, golden brown dish is the result. To cook enough fish for two meals at one time is an economy, as the left-overs may be used to make soup or creamed dishes.

WHAT DO YOU KNOW ABOUT PIANOS

Assuming that you can "tell a good tone," can you judge the hundred and one things which enter into the making of a Piano, the things which have their part in making and maintaining a good tone? Do you know the differences in plate and scale design? Are you familiar with the various "actions"? Are you a judge of the wood, the wire, the felt, the veneers and all the other materials which enter into the making of a Piano?

Probably not—not one person in a thousand possesses this expert knowledge. After all, when buying a Piano you depend greatly upon the expertness and the integrity of the Dealer or House. **Let your greatest care be the selection of the Piano House.** Tell that House what you would like and what you can afford and they will guide your selection of a Piano with expert judgment and a sincere desire to serve you well. Beware of a "cheap piano"—in the end it is the most expensive. Avoid the alluring statements of some dealers—they are but pitfalls to catch the unwary. Protect yourself by going to a Piano House with a reputation for integrity and fair dealing—you will never regret it.

We invite you to call at any of our stores — or write us asking for illustrated catalogues and prices.

We are dealers in Steinway and other Pianos, Pianola Pianos, Aeolian Player Pianos, Player Music, etc.

BARLEY.

There were no developments this week in the proposed Government control of barley prices. The market is dull and inactive both on the exchange and on the street.

Choice feed, per ctl............$2.40@2.47½

OATS.

There has been some inquiry for black oats this week, but no sales are reported. It is said the little stock of this description on hand is badly mixed with barley and practically unsealable.

Red feed, per ctl................$2.50@2.65
Red seed .... 2.75@3.25

CORN.

Corn continues inactive.

(First-hand prices on strictly first-class grain, San Francisco.)

California sacked ....$4.20@4.25
Milo maize .... 3.95@4.05
Egyptian .... 4.05@4.10

HAY.

Receipts of hay for the past week were 1611 tons, compared to 1794 tons the previous week. Although these receipts are very light for the season of the year, the market is slow and inactive, with very little demand. The poorer grades are moved with difficulty only. The majority of consumers throughout the city seem to be well supplied and are out of the market at present. The demand for hay at interior points is furnished direct, and does not reach San Francisco. The Government is using some hay right along, but owing to the fact that a great many animals have been removed from the Philippines and Hawaii, the usual trade for these points is lighter than formerly.

THE MARKET REPORTS

Figures Given are Independent and Reliable.
Prices Quoted as Paid to Producers.

FEEDSTUFFS.

The market for feedstuffs is quiet. Coconut cake is scarce, and it is doubtful if any holder could ship as much as a carload on demand. The price was advanced to $45.50 on account of this scarcity. Oilcake was also advanced to $78 on account of the scarcity of linseed. Otherwise the market was unchanged.

New alfalfa meal, per ton......$33.00@34.00

Garbanzos .... 8.00@ 8.75

POULTRY.

While there will be another Jewish festival Monday of next week, the principal feast days are past, and hens and roosters were weaker in consequence. Monday's holiday this week, with another holiday on Thursday of this week, has had a weakening effect on practically all descriptions except geese, which are stronger.

BUTTER.

Butter scored a two-cent advance over the high of last week for extras. Butter has been remarkably steady in comparison with the generally advancing market in eggs and cheese, and, while it is high, the general opinion is that it is now in for further advances. The receipts are not heavy.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extra	54½	54	55	—	55½	55½
Prime 1st	52	52	52	—	52	52
Firsts	49	49	49	—	49	Nom.

EGGS.

There has been a good deal of comment on the street and elsewhere over the high range reached by eggs on the local exchange. Some eggs have been imported which retailed at a lower price than the exchange wholesale price. These imported eggs are of the brown variety, and not so carefully sorted as the eggs dealt in on the exchange. They are fresh ranch eggs, but in comparison with the product of the exchange are designated as "culls." Members of the exchange explain the high price of eggs on the ground of demand for selected eggs and the statement that the people are willing to pay for the fancy product. During the past week the fluctuation of eggs on the exchange was less than it has been for a long time and the close found extras a half cent cheaper than the high of last week.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.

FRESH FRUITS.

The market has not been lively during the week. Plums and peaches are nearing the end of their season. Cantaloupes are not plentiful, but the demand has fallen to such a degree that this description sold at lower prices on ponies and standards. Grapes were more active than any other fruit this week. This fruit is in first-class condition and is in good demand. Isabellas are now arriving in quantity and are in prime condition for the housewife's jelly kettle.

Standard .... 3.00@4.00
Lemonettes .... 3.00@4.00
Grapefruit, fancy, new................ 5.00@6.00

DRIED FRUITS.

The dried fruit market is inactive from the buyer's standpoint. Apples are stronger and some purchases at 13¼c are reported. The driers who are willing to sell at the prices quoted have been pretty well cleaned out. The prices paid for apples and pears during the past week are said to be above the Eastern prices and this has a tendency to restrict purchases.

Special Citrus Market Report

Los Angeles, Sept. 11, 1918.

The market both in the East and on the coast is strong on Valencias, while lemons have suffered a slight decline. Valencias are selling in New York at unprecedented prices, fancies ranging from $8.50 to $11.25 and slightly over for extra fancy. The total shipments to date for the season, according to latest available reports, are: Oranges, 16,134 carloads; lemons, 5442 carloads. At same date last year there had been shipped 43,401 carloads of oranges and 7531 carloads of lemons.

LOS ANGELES

Los Angeles, Sept. 10, 1918.

BUTTER.

A higher market and good demand was had the past week for all extras. The Eastern markets are all higher, 2½@3c under an increased government demand, and that had a sympathetic influence upon the market here. The receipts for the week were 343,210 pounds against 291,700 pounds the same week last year. The cold storage holdings now are 559,279 pounds against 244,179 pounds the same week last year.

We quote:

1917—						
Extra	41	41	41	41	41	41

EGGS.

While the market here the past week was not so snappy as the week before, all fresh ranch found a ready market. Chicago was up 1½@2c during the week on first and San Francisco advanced ½c during the week. This with light receipts, only 666 cases of fresh ranch, by rail, for the week against 711 cases the same week last year, favored holders and enabled them to maintain a firm market. The receipts by truck continue to run about four times as large as the arrivals by rail, making the supply for the week 3330 cases against 3555 cases the same week last year. The cold storage holdings now are 80,393 cases against 68,501 cases this time last year.

Lima beans, lb. ....4½@5c

POULTRY.

There was a little more life to the market the past week. Light broilers were in good demand and under light receipts were advanced 1c. Heavy hens were also wanted and are up 1c. Light hens slow sale. Turkeys and ducks steady. Geese dull.

The following prices were agreed upon last Friday, September 6, and hold good until the coming Friday:

Broilers, 1@1¼ lbs. 35c
Broilers, 1½@1¾ lbs. 34c
Fryers, 2@3 lbs 29c
Roasters (soft bone), 3 lbs and up....29c

Hens ....22@29c
Tom turkeys ....30@32c
Ducks ....22@28c
Geese 15c
Squabs, live, per lb. 30c
Squabs, dressed, lb. 40c

FRUITS.

Receipts continue good, but the market was not over supplied the past week and under lighter offerings the tone of the market was better. The market for grapes was very good. Pears steady and in very good demand. The same may be said of plums. Apples selling better and a little higher. Quinces dull but steady. Figs selling fairly at old prices.

We quote from growers:
Figs, Black Spanish, 7-lb box ....35@50c
do, White, 7-lb. box ....30@50c
Peaches freestone per lug ....$1.00@1.25

do large, per doz................$1.00@5.00
Plums, per lb................5@6c
Quinces, per lug ....50@65c

BERRIES.

There was quite a falling off in the receipts the past week and the market was higher on strawberries and blackberries. Raspberries unchanged but firm.

We quote from growers:
Strawberries—
Fancy, per 30-basket crate....$2.50@2.75
Poor to choice, 30-basket crate 2.00@2.25

PRIORITY ACCORDED TO POULTRY AND LIVESTOCK INDUSTRIES.

As an illustration of the importance of the poultry and livestock industries as viewed by the Government in war times, the War Industries Board has, in the Priorities List issued on September 9, placed feed in the first class, immediately following ammunition, explosives, and similar articles directly used in warfare.

Blackberries, 30-basket crate.... 2.50@3.00
Raspberries, 30-basket crate..... 2.75@3.00

MELONS.

There were not so many in the past week and the tone of the market was stronger. Watermelons are selling fairly well. There was a good demand for cantaloupes at last week's prices. Casabas in liberal supply and slow sale. Paul Rose cantaloupes a little higher. Honeydew melons slow sale.

Cantaloupes—
Tip Top, home-grown standard crate .....$1.00@1.10
do, do, pony crate .....65@75c
do, do, jumbo crate.....$2.50@2.75
Columbia, jumbo crate ..... 2.75@3.00
Paul Rose, standard crate.....$1.25
Casabas, per lb.....1½@2c
Pineapple, standard crate .....$1.00@1.10
Watermelons, per 100 lbs..... .75@1.00
Honeydew melons, 16-inch crate. .90@1.00
do, jumbo crate ..... 3.00@3.25

BEANS.

Some new crop beans are now being offered and there was some little doing in limas and Lady Washingtons. All others are neglected. Blackeyes were dull and lower, as the new crop is said to be good.

We quote from growers:
Limas, per cwt.....$11.00
Large white, per cwt. 10.00
Small white, per cwt. 10.00
Pink, per cwt. 7.50
Blackeyes, per cwt..... 6.00
Tepary, per cwt. 8.50

HAY.

The market the past week was duller than ever. Not much coming in and very little wanted. Some little alfalfa was taken by the dairy people, but no one seemed to want horse hay.

We quote f. o. b. Los Angeles—
Barley hay, per ton .....$24.00@26.00
Oat hay, per ton ..... 26.00@28.00
Alfalfa, northern, per ton.... 21.00@22.00
Alfalfa, local, per ton..... 22.00@24.00
Straw, per ton ..... 9.00@10.00

COTTON.

The market the past week worked a little lower. The announcement that the War Industries Board had recommended to the President that steps be taken to stabilize the price of cotton caused traders to hold back and go slow. The announcement by the Agricultural Department that the outlook of the crop September 1 was for only a crop of 11,137,000 bales, against 15,235,000 bales June 25, prevented a break. The market closed Monday in New York: October, 34.07c; December, 33.54c. Spot middling in New York, 35.85c, against 36.60c a week ago. Spot middling in New Orleans, 33.75c.

Special Deciduous Market Report

By J. L. Nagle.

Conditions in most of the Eastern markets, with the exception of New York, remain unchanged. New York, however, on account of the extreme heavy offerings of cantaloupes, Northwestern stock, and increased receipts from California, was unable to take care of its offerings. The market in so far as the demand for fruit was concerned, was in good conditon, but the labor shortages and congested dock and track conditions made it impossible to handle the tonnage. As a result of a conference between the auction company, receivers and railroad officials, additional space was secured and the use of two additional piers was provided, which will probably relieve the situation in a few days. In the meantime cars are held on track and in some instances with insufficient ice, which has caused the fruit to become a little ripe. This applied principally to pears, which are being offered on the market at less than freight charges, which has a depressing effect upon good stock.

The demand for grapes seems to be in keeping with the supply, though some of the San Joaquin County offerings of Tokays, on account of quality, have not sold up to expectations. However, grapes arriving in good condition and showing good color, have so far brought higher prices than last year.

There seems to be little activity in peaches, both clings and freestones are meeting with good demand and it is not unlikely that the season on peaches will close with the market showing a steady advance.

The market remains unchanged on plums as the receipts are falling off.

The movement of wine grapes from the State is very heavy, but on account of the extreme hot weather of two and three weeks ago, some of the cars are arriving showing the grapes in a fermented condition and are causing some losses. As the weather is cooler, shipments leaving the State from now on should arrive in good condition.

The movement of Tokays is very light. The berries are not adding sugar and the color of the majority of the stock is pale and unattractive. It is the opinion of some that a large percentage of these Tokays, on account of lack of quality, will cause a declining market.

Following are the averages for the week:

New York: Plums—Gros, $1.73; Giant, $1.11; Grand Duke, $1.64; Kelsey, $1.39. Pears—Bartlett, $2.44; B. Hardy, $2.17. Grapes—Muscat, $1.82; Tokay, $2.24; Malaga, $1.70; Alicante Bouchet, $1.45. Peaches—Albright, $1.42; McDevitt Cling, $1.57; Wiley Cling, $1.50; Elberta, $1.10; Orange Cling, $1.39.

Chicago: Pears—Bartlett, $1.93; B. Hardy, $1.95. Peaches—Lovell, 77c.; Elberta, 97c.; Hulls Late, $1.04; Orange Cling, 90c. Plums—Kelsey, $1.30; Grand Duke, $1.75; Giant, $1.24; Gros, $1.34; Hungarian, $1.13. Grapes—Malaga, $1.27; Tokay, $1.39; Thompson Seedless, $1.31; Muscat, 95c.

Boston: Grapes—Malaga, $1.33; Tokay, $2.07; Muscat, $1.14. Peaches—Lovell, $1.00; Crawford, $1.10; Elberta, $1.15; Hulls Late, $1.00; Orange Cling, $1.25; Susquehanna, $1.10. Pears—Bartlett, $1.98; B. Hardy, $1.35. Plums—Giant, $1.05; Grand Duke, $1.12; Hungarian, $1.20; Gros, $1.24; Kelsey, $1.31; Diamond, $1.02.

Total shipments by cars from August 30th to September 5th, inclusive:

62 peaches, 10 plums, 235 pears, 1149 grapes.

Total shipments to date, 1918, 12,785 cars.
Total shipments to date, 1917, 11,538 cars.

Special Livestock Market Report

San Francisco, September 11, 1918.

CATTLE—Good weight steers are a little stronger. Other grades are steady. Cows are a shade stronger also. There is at the present time a heavy movement of Western stock eastward, which will likely continue along in November.

Grass steers—
No. 1, weighing 1000 to 1200 lbs..11@11½c
No. 1, weighing 1200 to 1400 lbs..11@11½c
Second quality .....9@10½c
Thin .....7½@8½c
Cows and heifers—
No. 1 .....7½@8c
Second quality .....6@7c
Common to thin.....3½@5½c
Bulls and stags—
Good 6c
Fair .....5@5½c
Thin .....4@4½c
Calves—
Lightweight 11c
Medium 10c
Heavy .....8@8½c

SHEEP—The sheep and lamb market are both steady, with a light supply and a light consuming demand.

Lambs—
Yearlings .....12@12½c
Milk .....12@14½c
Sheep—
Wethers .....11@11½c
Ewes .....8½@9½c

HOGS—Hogs are coming in more freely. The price remains unchanged. Indications, however, point to still further increases soon. While much of the stock arriving is in fairly good condition only, the quality on the whole is improving.

The advance in hog values both on the Coast and in the East has been steady and progressive for some time past. Two carloads of hard, grain-fed hogs sold in San Francisco last week at 18¼c, the highest price ever paid in this market. In the East the necessities of the packers have driven the price of choice hogs up to $20.00@20.35, also a record. The market is ceasing to prophesy of the end.

Hogs—
Hard, grain-fed, 100@140.....17¾c
do, do, 140@300.....18¼c
do, do, 300@400.....17¾c

DRESSED MEATS.

Ewes .....18@19c
Hogs .....25@26c

Los Angeles, September 10, 1918.

CATTLE—The market situation is unchanged. Thin and partly fat cattle are offered freely and the market for them is weak. Choice steers continue scarce.

Per cwt. f. o. b. Los Angeles—
Beef steers, 1000 to 1100 lbs.....$9.00@12.00
Prime cows and heifers..... 7.50@ 8.50
Good cows and heifers ..... 7.00@ 7.50
Canners, per cwt. ..... 5.00@ 5.50
Calves, per cwt. ..... 8.50@ 9.50

HOGS—But few really choice hogs coming in and they are in demand and firm at quotations. Most of the arrivals are in only medium to fair condition and slow sale. Prices rule high.

Per cwt. f. o. b. Los Angeles:
Heavy, averaging 275@300 lbs..$15.50@16.50
Mixed, 225@275 lbs. ..... 16.00@17.00
Light, 175@220 lbs. ..... 16.50@18.00

Rough docked 20 pounds, piggy sows 40 pounds and stags 40 per cent.

SHEEP—Not many coming in and not many wanted. For the few wanted killers are paying quotations.

Per cwt. f. o. b. Los Angeles—
Prime wethers .....$9.00@10.00
Prime ewes ..... 8.50@ 9.50
Yearlings ..... 9.50@10.50
Lambs .....15.00@16.00

Portland, September 10, 1918.

CATTLE—Receipts, 276. Market strong. Steers, prime, $12.00@13.00; good to choice, $11.00@12.00; medium to good, $9.75@11.00; fair to medium, $8.25@9.25; common to fair, $5.75@8.25; cows and heifers, choice, $8.00@9.00; medium to good, $5.75@7.25; fair to medium, $4.75@5.75; canners, $3.00@4.00; bulls, $5.00@8.00; calves, $9.00@12.00; stockers and feeders, $6.00@8.00.

HOGS—Receipts, 252. Market higher. Prime mixed, $19.50@19.75; medium mixed, $19.00@19.35; rough heavies, $18.00@18.25; pigs, $16.00@17.00; bulk of sales, $19.35@19.50.

SHEEP—Receipts, 258. Market steady. Prime lambs, $13.50@14.50; fair to medium, $11.00@12.00; yearlings, $10.00@11.00; wethers, $9.00@10.00; ewes, $6.50@8.50.

STATE FAIR NOTES.

At the Berkshire donation sale 12 young sows sold for an average of $80, with the top selling at $140. The proceeds will go into the treasury to be used in promotion work.

At the Red Cross sale $2,519 was realized. A Poland-China sow brought $225 and a Hereford calf $325. Governor Stephens opened the sale, and then turned it over to Colonel Ben A. Rhoades.

Lea Bleakmore of San Francisco, owner of Oak Knoll Farm, Lakeport, created quite a sensation in swine circles when he purchased the grand champion Chester White boar, Highlander, for $1,000. We shall tell you later about the model ranch that Mr. Bleakmore has developed and the fine stock he has.

H. C. Muddox, banker of Sacramento, who bought nine gilts at the Berkshire Red Cross sale, also bought the fine under-one-year herd of boar and three sows shown by W. M. Carruthers of Live Oak. Mr. Muddox bought these animals as a foundation herd for his son. The young man certainly has the right stock to start with.

The importance of breeding up was impressed upon hog raisers by a double exhibit in the University Farm building. A scrub sow, two years old and weighing only 120 pounds, was shown, and in the next pen were purebred hogs weighing over 200 pounds at six months. Another practical exhibit was a Chester White sow that had produced 4000 pounds of pork in one year—enough bacon for one soldier and pork for four civilians.

MISCELLANEOUS.

RABBITS FOR SALE—175 does, New Zealand, Flemish, Belgians and American checkered, all breeding ages. 75 does as above, 4 months old, at $1.50. A few fine bucks, some registered. All fine stock. Prices right. If you want to raise rabbits, here's a wonderful opportunity to get started. Come and select your choice. R. Daniels, Walnut Creek, Cal.

REMANUFACTURED PIPE.
All sizes standard pipe and wrought iron screw casing. All kinds of fittings. Guaranteed good as new. Write for prices. **Weissbaum Pipe Works,** 160 Eleventh street, San Francisco.

CO-OPERATION (not operated for profit) reduces living expenses. Particulars and catalogue from Co-operative League, Commercial street, San Francisco.

FOR SALE—Holt 30 tractor, Fire Bottom Benicia plow, 28-inch disks. Also 8-foot double disk harrow. Price $2,500. Fair Oaks Ranch, Willits, Cal.

TO REDUCE THE HIGH COST OF LIVING, send for our Wholesaler to Consumer Catalog. Smiths Cash Store, 106 Clay street, San Francisco.

PATENTS THAT PROTECT are procured through Pacific Coast Patent Agency. Savings and Loan Building, Stockton, California. Established fifty years.

ALL SIZES OF PIPE and screw casing, both new and second-hand, dipped and undipped. Guaranteed. Prices right. Shecter Pipe Works, 304 Howard St., San Francisco.

FOR SALE—A deep well pumping outfit, complete; 100 feet 7-inch discharge pipe. Box B, Menlo Park.

FOR SALE—Sandwich power hay press, 17x22 bale; practically new; $400 takes it. Ceres Hardware and Implement Co., Ceres, Cal.

COUNTRY LANDS.

FOR SALE—160-acre dairy farm, two miles northwest from Dixon (eight miles from Davis State Farm), in the heart of the dairy section. Two silos and all necessary buildings and pumping plants. For price and terms, with further information, inquire of Howard Kirk, Dixon, California.

FOR SALE—20-acre irrigated ranch, with improvements and growing crop; team and farming implements; a bargain. William Paulsen, Chowchilla, Cal.

A HOME to delight a son of Italy. View, air and woods beautiful. Fertile soil. Gravity spring. 9-room home. All modern conveniences. Box 67, Kenwood, Cal.

WANTED.

FARM MANAGER OR FOREMAN—Energetic, scientific, practical, on large farm or estate. Experienced in modern farming. Can qualify in dairying, beef cattle, hogs, alfalfa, beans and grain. Three and half years in present position. AA references. Box 1250, this office.

WANTED—By A-1 farmer, job as superintendent or foreman on hay and grain or fruit ranch. Married. No children. No domestic service for wife. Thoroughly experienced. References. J. H. Smith, Windsor, Cal.

POSITION WANTED to take charge of a hog ranch by a single man, experienced in handling registered stock. Hans Duveneck, Ukiah, Cal.

The Thrift Car

Makes a Bigger Man of the Farmer

FARMING is the biggest consumer of man-power; every farmer knows there is a shortage of man-power. Therefore every one must increase his efforts; he must do *more* work and more of it in *less* time.

A very large percentage of Overland cars are bought by farmers. They realize Model 90's value in multiplying their usefulness, saving their time, energy and increasing their efficiency.

Let an Overland perform innumerable work duties for you and in addition be an endless source of recreation and benefit for *every* member of the family.

Select this beautiful, roomy Model 90 and you save money in the first cost and maintenance.

You cannot get complete satisfaction from less advantages than it gives—

And you cannot get as much value in any other car for the low price of this Model 90.

It has a powerful, fuel-saving motor; narrow turning radius; rear cantilever springs; 106" wheel base; 31 x 4 tires, non-skid rear, electric Auto-Lite starting and lighting and vacuum fuel system.

Order *your* Model 90 now.

Five Points of Overland Superiority:

Appearance, Performance, Comfort, Service and Price

Cover-Crops for the Production of Humus

Written for Pacific Rural Press by John J. Fox

THE USE OF COVER-CROPS for recruiting the productive capacity of the soil probably dates back to prehistoric man. It is Nature's own way of providing the soil with humus, without which none of our commercial crops can live and thrive. Our farmers realize that the time has come when small profit can be obtained for any length of time on our high-priced land without the aid of fertilization. We have stimulated production by good cultural methods and by the application of lime, gypsum, nitrate of soda and other mineral substances, all of which are good as auxiliaries but do not tend to permanently enrich the wasted powers of a producing soil. Farmyard manure has been called the "farmer's magic wand." In England, France, Germany and Scandinavia, in China, Japan, Italy and other old countries this wand is waved continually. But we in California cannot obtain this manure in sufficient quantities for all. And a long haul very often precludes its use. So we have to fall back on the cover-crop very largely—more so since the tractor is gradually replacing the horse.

The science of horticulture is so vast that no general practitioner can ever become familiar with many of its mysteries. Our science is, in fact, the sum of human experience and research and we are adding to it every year both in the field and the laboratory.

A good stand of vetches in a deciduous orchard. One of the best legumes we have. With the use of a rolling coulter, this can be turned under green, decomposes rapidly and its fine root system leaves the soil in nice, friable condition.

The time of year has now come for us to prepare our seedbed and get our cover-crops in. Our choice lies in vetches (all varieties), burr clover, Canadian field peas, winter barley, rye and oats for the north, to which may be added melilotus, buckwheat, Tangier peas and fenugreek for the southern part of the State, and in industries where the time for cover-cropping is deferred, as in citrus and some olive sections.

Preparing Ground and Planting.

A good disking, cultivating or harrowing is all that is generally necessary in an orchard to prepare for cover-crop in the fall. If Oregon or purple vetches are to be used in the orchard, they should be drilled in at the rate of not less than 60 pounds to the acre, and 90 pounds is better for the first year of using. If broadcast, not more than 30 pounds of barley, rye or oats should be used with 60 pounds of vetches on strong ground, as by stooling heavily the grain will choke the vetches out too much or render the plant spindly and weak.

Vetches

like the drill better than being broadcast. They thrive better with close companionship and must be started early if a good stand is to be obtained by plow time. And when plow time comes—in unirrigated sections—turn the crop under, no matter how promising it looks, for the sake of fully conserving your moisture.

Canadian Field Peas

should be drilled in, too. They also make a better stand that way, and too much seed is better than too little—not less than 1½ bushels to the acre. More on light soil. If, because of the impoverished condition of the orchard, the legume refuses to grow, which is not uncommon, then sow 70 or 80 pounds of barley, rye or grey oats to the acre, or on bottom land 50 pounds is enough, and turn it under in March—no later. Then try a mixture containing legumes the following year and you will probably make it. A dressing of nitrate of soda of 100 pounds to the acre about the end of February will help matters along rapidly.

Burr Clover

is a great favorite in sections where it germinates freely. It is indigenous to the soil of California, it makes an early start, roots deeply, yet has countless little roots that disintegrate the soil and is one of the best nitrogen producers. It makes a good cover-crop if started early, before the ground becomes chilled and the nights cold. Only hulled seed should be used and about 20 pounds of seed to the acre—more on very light soil. If land is very much out of condition, this only grows to about six inches, then goes off color and ripens by the end of March or early in April in a dry season. In this case a cereal must be plowed under or a coating of manure given to provide conditions suitable to a good legume stand.

Barley, Rye and Oats

will practically always provide some sort of crop to be turned under. Another advantage is that where legumes have been constantly used these cereals help to cleanse the condition of the soil, which is one of the advantages derived from rotation of crops. And if rotation be profitable in the field it should also be profitable to the soil of an orchard. There is no doubt that experiments of this kind will have to be tried. Who knows that it may not have beneficial results in certain sections where aphis and other small insects have become so numerous on vetches and other legumes that are planted year after year as to be the despair of the citrus grower? I believe it is axiomatic that, wherever large areas are given over to one crop industry, there will that crop's enemies appear in numbers or degree sufficient to threaten. A change is necessary for everything that lives and grows.

General Advantages of Legumes.

Legumes leave the mechanical condition of the soil in much better shape than any of the cereals, besides having greater manurial value. After burr clover or vetches the ground turns up friable and kindly, while the thick, coarse roots of barley and rye make it turn over lumpy and solid by comparison. Then the ground needs more working down and sometimes it leads to overworking, depending on the condition of the soil and the weather, also method of handling it after plowing.

I have not yet mentioned the horse bean, which also belongs to the vetch family, because it is hard to obtain. The Windsor bean, which is called the horse bean, is one of the same variety. It also has a deep-penetrating tap root that will go through the average plowsole. Its chief objection is the black aphis that appears on the terminals in spring and sometimes injures the crop considerably. When the real horse bean comes I think it will prove one of our profitable crops. The same with the white lupine when it is grown in commercial quantities. At present there is no seed to be obtained and nobody is growing it for seed in commercial quantities.

Where a good, heavy stand is obtained, the crop must be rolled down or a heavy chain used to turn the crop completely under. For if the ends of plants are allowed to stick out between the furrows fermentation is delayed or incomplete. Everything must be thoroughly buried and if a float is run after the plow so much the better.

Every district must really find out for itself the cover-crops best suited to its locality. And, even at that, so diverse are conditions of soil, drainage, altitude, moisture and climate that no rules can be definitely laid down to apply to all. Each farmer must put his own brains to work in the application of any rules.

The cover-crop must be sufficiently green when turned under to occasion its rapid fermentation. Even where irrigation is practised, a matured crop does not undergo sufficiently rapid decay and is inclined to interfere with the proper functions of the dust mulch. The cover-crop may be supplemented with dressings of lime (occasionally) and commercial fertilizers as is seen desirable.

EDITORIALS

BACK AGAIN AT THE OLD STAND.

WE WERE very seriously at the war fronts last week and as things are going so well over there and looking so well for the Liberty Bond drive over here, we slack no duty by returning this week to the normal autumnal occupation of a Californian, which is to speculate and prophesy as to what the rainfall of the new crop year will be. And we hasten to a first word on that subject because the professional weather prophets have not yet been soaked out and limbered up even by the very unusual September rainfall of this year. Possibly, however, there is really no need to hurry, for these prophets should now be somewhat slow and reticent from the way they got the prophetic breath knocked out of them in last year's collapse of their predictions. It will be remembered that the thermometrical prophet promised us about a third more than the normal rainfall and we really received about one-half less: while the sun-spotter tried to blacken the sky with storms all through the months during which nature persisted in blueing it to the tourist's taste. The result was that we had to live and work through a season than which there were only four drier in all of our American-Californian history, with only 11.48 inches dropped in a bunch and the crop-year dry at both ends.

WHAT DOES SEPTEMBER RAIN MEAN?

WE SHALL not attempt to preach upon what a heavy September rainfall means. We do not know what it means in terms of the season's prospects and therefore we preach not. Our present purpose is to keep other preachers from assaulting the public ear. There is always a great temptation to remember parallel weather occurrences and to draw categorical conclusions which are irresistible if one has no contrary category with which to defend himself. We propose to furnish each reader with a gas mask with which he can defend himself from stupefaction by the oldest and other inhabitants, thus—

SEPTEMBER AND SEASONAL RAINFALLS.

Year	Rainfall in Sept.	Seasonal	Year	Rainfall in Sept	Seasonal

1883-84	.42	32.38	1918-19	2.53	.....

The foregoing figures are inches of rainfall from observations in San Francisco, which is usually counted central and representative pluviometrically as well as geographically. Of course, the record for September of this year is incomplete, but we are probably justified in claiming that no one cares to have any more water added to it—though we may get more water without changing the seasonal significance of it.

SIGNIFICANCE OF SEPTEMBER RAINFALLS.

A PARAGRAPH under this heading need not be long, for we greatly doubt if September rainfall has any significance in forecasting the character of the crop year. Let us see first how September stands in our three wettest and three driest years, viz.:

Year	September	Seasonal
1861-62	.02	49.27
1867-68	.04	38.84
1889-90	...	45.85
1850-51	.33	7.42
1863-64	.03	10.08
1897-98	.10	9.38

Or try to see directly what follows the wettest Septembers, viz.:

Year	September	Seasonal
1904-05	5.07	23.45
1916-17	1.68	15.76
1912-13	1.25	11.97
1898-99	1.06	16.87
1894-95	1.05	25.70
1851-52	1.03	18.46

These are all of the rainfall years during the last seventy which have opened with more than an inch of rain in September, and they are nothing to be proud of. But our position is that none of these years has been our best and that actually September has no significance either when it gives most or least precipitation, although people with short or defective memories will be trying to make much of current experience in both ways.

UNDESIRABILITY OF SEPTEMBER RAINS.

AS September rains are not significant of the character of the season they usher in, are they of value in themselves? The California judgment, born of pioneer experience, is that they are more of an injury than a benefit and it is fortunate that they are usually absent or in such small amount as to be negligible. When they are heavy enough to do much wetting they interfere with the latter part of the harvest season, which it is California's distinguished advantage to count upon as long, warm and dry. In this way they catch and injure sacked grain and baled hay which still awaits hauling to cover and they fall with all the destructive power and pleasure of the Huns upon the unfinished harvest of beans, hops, late cuttings of alfalfa, grapes, raisins, prunes, peaches and other sun-cured fruits, and they muss up the land for the rice harvest. As the development of California agriculture has vastly increased the output of late-harvested crops, September rains have become a much more serious affliction than they were in pioneer days, when uncovered grain and hay were chiefly injured and when the ruin of dry feed and the too-early starting of seeds of pasturage which was likely to miss moisture enough to keep them growing, were most loudly deplored. These things are enumerated, of course, for the edification of newer Californians who are apt to enjoy the delights of the dust-settling and air and plant washing by the heavier September rains, without thought of the injury they are doing. It is fortunate, of course, that the first reports of such injuries are usually overdrawn and much exposed produce which looks very sad in the wet is restored to value by the absorptive power of dry air and soil, but still the losses are often serious. Members of our staff are out as we write in sections where most injury is menaced and interesting notes of their observations may be found elsewhere in this issue.

Of course, as our agriculture advances in efficiency, we shall be better organized to protect products from too-early rains. Already there has been much gained in this direction and more improvement is in sight. Soon we shall have all our valley grain in elevators before the end of August, which is the driest and safest month of the year, and we shall have shed-roofing to cover all the hay—except that which is being held in well-made stacks. We shall also have capacious dry-houses to finish the fruit-curing when the sun strikes on his job. A better labor supply and larger possession of power machinery will reduce the bean dangers by an earlier finish of the harvest. All these and other ways of speeding up work and protecting the products of it will baffle the September storm invaders.

WHAT GOOD IN SEPTEMBER RAINS?

THERE are few unmixed evils—even the present war, which is the world's worst and most abominable in the purposes of those who made it, will leave us a better world. Like unto it is this September rain—great though its local losses may be in places. Ever since the rains stopped last spring with only about two-thirds of the normal precipitation we have been preaching the need of getting some supplementary water on the trees, not only for the sake of the current crop but for the next one also, and in some cases for the very life of the trees. More orchard owners did summer irrigation this year than ever before and yet there was a large preponderating area of deciduous trees upon which no irrigation could come to help the trees meet the crisis of two years' dessication. Last week's rain will act as an addition to last winter's rainfall—not to start new growth but to compensate for evaporation which might have destroyed the trees before their root systems could get relief from rains starting normally late in the autumn. In this way the rain has been beneficent—a surety of future production.

The year which is now beginning, for the September rains open our autumnal springtime, should be the greatest gardening year of our history. The way to do spring gardening in California is to begin in the fall—he who hesitates until the narrow-minded Eastern almanac tells him it is spring is apt to be lost. Wherever the rain, which in places has been twice as great as in San Francisco, has wet the ground to the bottom of a spade-thrust, go confidently to the preparation of the ground and the immediate planting of all garden plants of which the leaves or roots are the edible portion, for they are practically hardy against all California valley frosts, and add peas, for they, too, scorn our kind of frost. If you hurry these things in now, you will have salads and relishes for Thanksgiving and green peas and boiling roots and cabbages for the holidays. The way to do this is to begin now successive planting which will keep you pulling your living from the earth of your own garden until the end of the war or until the regenerated German people celebrate the Fourth of July, 1919, in Berlin—under the upturned marble noses of the stuffy old drones of his Hohenzollern ancestry which the kaiser has set up. All this is very easy to do if you know how, and the how to do it is described in detail in our charming story book, entitled "California Vegetables in Garden and Field," which the publisher of this journal has kindly consented to send you for the sacrificial price of $2 per copy—and if you cannot make $20 or $200 for your own nutrition from the first reading of it, it will not be the fault of the September rains.

Of course, early work in the garden is but one side of the shield. The rain has been enough to start field work over large areas of the State and early sowing of winter-growing grains, roots and forage plants, also for early start of alfalfa and cover-crops, will suggest themselves. Our staff writers are at work on the practical details of all such undertakings and we shall expect them to corruscate in these lines in every coming issue. The main thing now is not to speculate on rain but to get the land busy!

AMERICAN GIRL PROPAGANDA.

FROM much reading of tender tributes in the letters of American soldiers to the delightful companionship of young women of France, who hail them as delivering knights out of story books, we have arrived at much concern over the future of our American girls. We might sigh over the fate of our girls when the boys come back; but it is worse than that, for we fear that too many of them will not come back: that is, will not come back alone—which is all that matters from a girlish point of view, for a man pre-empted is a man lost. For these soldiers' letters say so much about the glory of combined French and American arms—which, of course, is all right for a soldier, if you know what kind of arms he is

writing about. It is all right for a soldier of ours to be full of the glory of allied arms up to his neck, but it is the glory of arms around his neck which gives us concern and anxiety. And when the letters bashfully refuse details of such supreme matters they do hint at the sparkle of French eyes and the charm of broken English on French tongues, even though they hasten to enlarge upon the devotedness of French young women to home-making and to their self-helpfulness in providing for their own wants—even to the making of entrancing crinolinear dewdads for the adornment of their persons from back-number Yankee flour sacks! Now it strikes us that all that is rather dangerous stuff for an American soldier to get under the left side of his tunic, for the portent of it to us is that there will be mighty few American soldiers coming back alone—if the supply of French girls holds out, and the statisticians say there are plenty of them!

And what starts us on this gloomy reflection is that recent announcements of American war policy will hopelessly handicap our American girls from doing anything effective to save our young men from falling in this French war of conquest. For though the French nation as such repudiates a war of conquest and only wishes to regain certain old French ladies called Alsace and Lorraine with whom the Germans eloped forty-four years ago, the French young woman is surely in for conquest and her objective is a certain young, upstanding, solemn young fellow whose name in modern parlance is Sammy. How does our war policy help her? Well, read this, which is telegraphed from Washington this week:

According to the monthly business review of the Federal Reserve Board, the number of women entering industry will be greater than the number of men withdrawing for military service. These women are spending more of their new earnings for clothing. Retail dealers in all cities where women recently have left their homes to work elsewhere report booming business. This is contrary to the policies of economy urged by all Government agencies as a war measure.

And this seems to imply that it is our war policy to discourage our young women from spending their self-earned money to secure all that they need to make them irresistible and forces them to send to their sweethearts somewhere in France photographs of girls in old-fashioned, dingy duds while their rivals dance about and dazzle these warriors with flour-sack creations of pleats and flounces, branded "drifted snow"—with all the suggestive allurements thereof. Manifestly what we need is an American girl propaganda. The Federal Reserve Board should issue a new circular telling our money-earning girls to bedeck themselves with all the new and pretty things they can buy and when thus encharmed the Government should fill the billets in French villages near the front with certified photographs of them with such inscriptions as this:

"These American girls earned the money to buy their own lovely clothes. They can not only do that, but buy clothes for you also! Bring home your hearts, young Americans!"

Of course, there would be a lie in it—which seems to be necessary in modern propaganda. We do not care whether a well man who will let his wife pay for his clothes comes back or not. But the danger of losing our man-power through a Government policy which aims to make our girls as unattractive as possible must be counter-attacked in some way or there may be more citizens of American paternity in France than in the United States!

PATRIOTISM AND PROFIT

You can combine them by joining us in our campaign to help farmers raise more and better crops.

We need more men to attend to our renewals and present the paper to those who are not already subscribers.

If you have an automobile, can give us your whole time, and think you can present the merits of the paper in a convincing way, let us hear from you.

We have an attractive proposition. Pleasant work; straight salary; permanent, with advancement.

Don't let this opportunity pass by.

QUERIES AND REPLIES

By the Editor.

Inquirer Must Give Full Name and Address.

Gummosis of Apricot.

To the Editor: I enclose limb from apricot tree. This tree is a large, healthy tree, but produced only half a dozen 'cots, very large in size; but the fruit is all split open. The entire tree shows exudation of sappy gum. Is this sour sap? If so, how can it be corrected?—J. L. S., Walnut Creek.

This is an old trouble which has not yet been definitely diagnosed by the experts and we cannot give more satisfactory answer to your question than we did to other questions about gummosis in our issue of September 7. It is not demonstrated whether the trouble is local in the top of the tree or results from root affection, or whether it may proceed from either. Speculation as to causes includes extremes of heat and cold or one coming on the heels of the other. It sometimes affects a single limb and sometimes the whole tree. It sometimes kills the tree and sometimes the tree recovers. Our opinion is that the lack of fruiting and the cracking of the fruit are not necessarily connected with the cause of the gumming, for we have seen plenty of good fruit on branches which were gumming badly. We prefer not to call it "sour sap" because we find branches gumming badly and still carrying good fruit and foliage and no fermentation discernible. The only corrective treatment which now seems to us rational is to give the tree as good growing conditions as possible—removing danger of standing water by drainage and danger of too great autumn drying out by summer irrigation and growing a summer cover-crop to lower soil temperature. All these things should make for promotion of health and vigor in the tree.

Irrigation and Fruit Buds.

To the Editor: I have early shipping peaches that do not bear every year, but on all of the twigs there is a growth from one to two feet and the top branches have sent out a new growth three and four feet in length. Would you think such trees require a late irrigation in order to mature fruit buds? Do you think a midsummer irrigation, after the fruit is off, would make them bear more regularly?—J. B. T., Ceres.

The strength of fruit buds does not depend upon the amount of wood growth made early in the season but upon the holding of the foliage on that growth green and active through the late summer and early autumn. Therefore, a good early growth of new wood does not settle the question. If your trees show signs of too early dormancy by yellowing of the leaves, an irrigation after fruit picking may insure a following crop. If, however, the foliage remains green as late as this date, for instance, it is likely that irrigation is not necessary and lack of bearing must be traced to some other cause.

Why Not Crop the Land?

To the Editor: I have a field that is quite sandy and I wish to improve its fertility and its water-holding capacity by adding humus. It was in alfalfa for six years, but the last two years in beans—giving a crop of seventeen 80-pound sacks of teparies per acre in 1917, but not so good this year. I am told to sow 30 pounds of vetch and 10 or 15 pounds of barley per acre. Would not rye be better than the barley? Would it be necessary to inoculate the vetch with soil bacteria at a cost of $2 per acre?—J. T. S., Denair.

If you wish winter feed, rye and vetch is a good proposition, and in your case rye is better than oats because it will do better on sandy soil. There is no sense in inoculating seed to be sown on land which has successfully carried alfalfa and beans for six years. Increasing the organic matter by growing cover-crops is a good thing and will make a sandy soil more retentive, but after six years with legumes it would be a reasonable rotation to make the land give you a large yield of grain or sugar beets or some other saleable crop, which it ought to be amply qualified to do if it gets moisture enough.

Fall or Spring for Alfalfa.

To the Editor: Is it advisable to plant alfalfa up here in the hills this fall or wait until the latter part of March, next spring?—E. L., Lake county.

If you have to wait for rains to get the ground ready and you are likely to have sharp frosts rather early, it is safer to wait until spring, when there is less chance of losing your seedlings, which usually will not have time enough to get frost-resistant. But there are places in the hills where they are pretty sure to come through. It depends upon local conditions.

Fruit Trees in Old Corrals.

To the Editor: I have a piece of ground that was used for a corral, and trees on this ground do not thrive. Would lime help correct this?—B. T., Ceres.

Your old corral evidently has more richness than fruit trees can tolerate. It is possible that too much acidity in the soil, due to fermentation of excess organic matter, may be the trouble, and in that case lime will be corrective. Old corrals should not be set with trees until after a period of cropping with grain, squashes or other vegetables.

California Weather Record

The following rainfall and temperature record is furnished the Pacific Rural Press by the United States Department of Agriculture Weather Bureau at San Francisco for the week ending at 5 p. m., September 17, 1918:

Stations—	Rainfall Data: Past Week	Seasonal To Date	Normal To Date	Temperature Data: Max'm	Min'm
Eureka	1.08	1.81	.67	64	52
Red Bluff	6.96	7.08	.21	100	60
Sacramento	3.56	3.56	.14	88	58
San Francisco	2.53	2.53	.01	80	54
San Jose	6.25	6.25	.15	80	58
Fresno	...	.01	...	92	58
San Luis Obispo	.60	.61	.12	82	56
Los Angeles	.10	.22	...	98	64
San Diego	.06	.17	...	94	66

Money in Fruit!

Plant you bare land in fruit this year. If you have old, unproductive orchards, replant with young, vigorous trees that will return a profit. For best success plant

Elmer Bros. Fruit Trees

These trees have strong, vigorous roots, are clean and healthy, and are budded from orchards of proven productiveness. They are trees with a pedigree! Don't experiment—buy from nurserymen with a reputation for good trees.

Write for a copy of our latest price list.

Rodent Control—An Achievement

[Written for Pacific Rural Press by John J. Fox.]

The operations of the Rodent Control Division under the State Commissioner of Horticulture have had wonderful results. Owing largely to the work of G. H. Hecke, the State Commissioner, rodent control was included in the horticultural statutes by action of the State Legislature of 1917 and the law became effective July 27, 1918.

Many county horticultural commissioners got work under way in their counties, through educational campaigns and with the help of their farm centers — the first of which was in San Luis Obispo county. The U. S. Department of Agriculture, through its Bureau of Biological Survey, represented by Biological Assistant W. C. Jacobsen, did a great deal of the educational work. Following these campaigns, each county commissioner participating took an active interest in the enforcement of the law.

The Biological Survey also was cleaning up Government lands under Jacobsen's direction. G. H. Hecke saw immediate need for cleaning up State lands, as well as to have a force of field men to work and to demonstrate proper methods of control. Mr. Hecke succeeded in obtaining an appropriation from the Board of Control to establish such a department through war emergency funds. In January, 1918, W. C. Jacobsen was appointed superintendent of the new Rodent Control Division, with S. V. Christierson as assistant superintendent.

A big spring drive against the squirrels then took place, in which all county horticultural commissioners participated. A school children's contest from April 29 to May 4 was announced by Governor Stephens and for squirrels killed Mr. Hecke offered prizes amounting to $200.

A total of 104,509 squirrel tails were turned in by school children. From Lassen county alone the children sent in 31,293 tails after the contest closed.

California was divided into five rodent control districts, each with a field assistant in charge. Each field assistant has charge of cleaning up State lands in his district as well as leading the educational work for the county. Hundreds of demonstrations have been given by these men.

A system for co-operative purchase of poison supplies was inaugurated by the Rodent Control Division with the U. S. Biological Survey. As a result the county horticultural commissioners have been able to save the farmers of California thousands of dollars.

Many thousands of acres of State lands have already been cleared of squirrels.

At the State Fair at Sacramento the exhibit of this division attracted a great deal of attention. Many mounted groups in habitat had been prepared and were on display, together with a number of study skins of the various squirrels, gophers, rats and other rodents.

During the late fall one of the issues of the Monthly Bulletin of the State Commission will feature the ground squirrels of California—life history, habits, control, history of work in the State and results accomplished.

In the coast region an active campaign against pocket gophers has been started—to continue through the winter. In the spring an intensive campaign will be waged to get those ground squirrels that have escaped this year. This systematic State-wide campaign has been successful: (1) War-time exigency demands conservation of foods both from farm and on the range; (2) every county in California is concerned; (3) a suitable law is at hand to govern the operations of the officers having the work in charge.

In looking back it is really remarkable to think we have so long allowed these destructive little pests to increase and multiply and replenish the earth at the expense of our stock and our granaries.

It has been estimated that in grain feed and fruit they have cost us $30,000,000 a year to keep.

This is the greatest individual work the State Commission of Horticulture has ever administered and it is to be hoped that in future the squirrel will be looked upon with the same horror as the rat. May the warfare be kept going. This has been our most expensive year in the matter, but it has been money exceedingly well spent.

J. P. Herring of Oakland, State Taxidermist, collected, mounted and prepared all the exhibits in this division at the State Fair, the various groups being very artistic and life-like.

GIANT FARM POWDERS
STUMPING — AGRICULTURAL

Uniformity is another word for economy and safety. When the same things happen with each pound of Giant Farm Powder, you know not only how much to use, but what results to expect and how to handle the explosive.

Giant Farm Powders are surer, safer and more economical because our tests guarantee every pound. We maintain our own completely equipped chemical division to inspect Giant Farm Powders during every process of manufacture. Absolute uniformity means absolute dependability. Like results always obtained under like conditions make western farmers prefer Giant Farm Powders.

"Giant Powder is the most satisfactory," says John Zurr, Santa Rosa, Cal. "I account for this because Giant Powder is made with the utmost care."

Caution: Be sure you get the genuine. That other explosives are often called "Giant Powder" indicates the high quality of the original. Look for the Giant trade-mark on every case.

The coupon (or a postal mentioning this paper) will bring you the big book "Better Farming." Tells how to remove stumps, prepare tree beds, and do all kinds of farm work cheaper and better. Write for it now.

Little Leaf of Prune and Peach

To the Editor: I send specimens of prune twigs from the orchard of S. A. Benson and the peach twigs from A. Gunnarson of Kingsburg to see what is the matter with the trees.—G., Kingsburg.

[Answer by Professor W. T. Horne of University of California.]

The peach trouble seems without doubt to be a form of little leaf, but developed late in the season and involves only the late growth. The early leaves appear to be normal, or nearly so, but the later ones are pale and exhibit the usual characteristics of little leaf. It seems probable that this might be considered a slight or incipient attack of little leaf disease.

As to whether these plants will show full development of little leaf next year, or whether the trouble will tend to disappear, I am unable to predict. Little leaf as a disease appears to be rather poorly understood by pathologists, but apparently it is due to some influence existing in the soil, and these specimens would suggest that the conditions in the soil which bring about little leaf had become active only late in the season, and it is possible that this condition will disappear again during the winter. It would seem that in cases of this kind there might be hopes of stimulating the trees so that they might overcome the disease, either by steadying the water supply or by increasing the available plant food, or both.

The prune twigs seem to be affected in about the same way, but the trouble, if it is little leaf, as it appears to be, has not progressed so far. The spotting and burning of the leaves is such as might be due to extreme exposure to drying conditions, in which the latest growth does not have the needed amount of water and the development is accordingly abnormal.

The series of diseases due to drouth and the little leaf condition offer a field of study which would be very interesting to a plant pathologist who would be sufficiently well trained in various phases of plant physiology and the related sciences, but there seems to be nothing very conclusive nor satisfactory to say at the present moment.

Berkeley.

Cover-Crops for the Production of Humus

(Continued from first page.)

One question that is repeatedly asked, year after year, is: "Is it necessary for me to sow a cover-crop where a heavy stand of weeds and native grasses grow each year?" It is not necessary. So long as a good stand of burr clover, miner's lettuce, "filaree" and other native plants grow thick enough to make a good stand, there is no need to spend good money for seed. But a good stand of weeds will not come up perpetually in an orchard if plowing is done at the right time and done thoroughly. And that is when the crop is lush and green. If the weed crop consists chiefly of mallows, wild mustard and wild radish, it must be turned under very early, before it becomes woody, or it will not rot sufficiently and will interfere with the effectiveness of the tilth throughout the whole year. To let any crop mature before it is turned under is to rob the soil of nutriment that it needs and then returning it again to be made over. The immature crop takes a large portion of its tissues from the air and moisture. But

THE CHIEF ADVANTAGES ARE

(1) that it readily ferments and becomes available as plant food; (2) that its mechanical action renders the soil more friable throughout and more easily worked; (3) more retentive of moisture and the maintenance of an equable temperature in the soil. I have dwelt on this phase of the cover-crop because its importance is paramount, and my opinion is based on experience, observation and comparing notes with others.

In another article the subject of artificial manures and their relation to the cover-crop will be dealt with. To neglect this important matter till injury to the soil becomes apparent is bad stewardship and poor business. A really rundown and exhausted soil takes a long time to recover. It wears out the pocketbook, the patience and the enthusiasm of the best intentioned who undertakes it. Any man with pride in himself and his business desires to leave his land in better condition than he found it. Our best bottom lands seem to have no limit to their unaided productiveness, deterioration is so slow—but it is certain. Our thin sandy loams and benches, however, wear out very quickly if not carefully farmed.

Does Your Life Work Mean Anything to You?

¶ You farmers who have worked hard—and no one works harder—to get together your property, what does it mean to you?

¶ Your property—your farm and buildings, your crops, your stock, your farm implements and, too, your home—all of these represent years and years of work that you have done.

¶ Everything that you enjoy as the result of your work comes to you and stays with you because the heroic soldiers and sailors of Uncle Sam are standing between you and the bloodthirsty, murderous Hun.

¶ To keep the Hun away from you, Uncle Sam does not ask you to GIVE even a single penny. He simply asks you to LEND him your money at good interest and he guarantees on his word of honor—a word that has never been broken—to pay back every penny you lend.

¶ What is your answer?

Farm Products Must Increase

If we are to win the war and win it quickly our soldiers and our allies must be well fed. We cannot expect them to do their best to win unless we do our best to back them up. How are you going to make every acre of your farm produce to its utmost? Just as our army must be well fed so your soil must be fed. You must supply it with the elements necessary to produce crops.

GOLD BEAR FERTILIZERS

are scientifically manufactured to meet California soil conditions and crop necessities. They are made from animal products that contain the necessary elements to feed your crops.

Here and There in the Fruit Business

[Written for Pacific Rural Press.]

Irrigation Overcame Atrophy.

William Wheeler of St. Helena, Napa county, has nine acres of French prunes that gave him 23 tons of green fruit at eight years old. We remember when this young orchard at four years old was suffering from die-back through malnutrition. The bark on trunk and limbs showed dead, shrunken areas, like anthracnose, and many good limbs died back entirely because the sap flow was shut off. Mr. Wheeler dug a well and installed a pumping plant and now irrigates once a year—about the middle of May. He says the old condition has entirely disappeared and the trees are strong and thrifty. He only has to go eight feet to water. The soil is a gravelly clay loam and clay loam.

"Woman's Land Army the Thing."

This is the dictum of F. M. Cowell. And further: "Our wives and daughters have gone to work in the canneries, not because they need the money which they earn but because they realize that our tomato crop must be saved and it will spoil if they do not lend their efforts. There has been a shortage of labor here for awhile. The activities of the Woman's Land Army will doubtless be added to and extended next year."

Large Vineyard Sale in Kings County.

The Lucerne Vineyard, located five miles north of Hanford, and consisting of 1320 acres of land, has been bought by Wylie M. Giffen of the Raisin Growers' Association of Fresno. This vineyard is said to be one of the largest in the world of Muscat grapes. The price paid is reported to be $600,000. This year's crop, including the trays, representing a value of $150,000, goes to the new owner.

School Help.

Mr. Morehead, president of the Sutter County Farm Bureau, said at the State Conference of Farm Advisers at Sacramento that he had never had more satisfactory help in hoeing his 1200 acres of beans than the Oakland-Berkeley school boys that he employed this year. They knew nothing of their duties when they came, but quickly learned what was required of them and took pride in doing good work.

New Bulletin.

The subject of seedless grape production in all its phases will be set forth in a bulletin to be issued shortly by the College of Agriculture, University of California. Write for it.

Thompson Seedless grapes are now on the trays and Muscats (raisins) are now half picked. So far the harvest season has been very favorable.

Good Returns in Lake County.

G. H. Lyon of Lakeport will harvest 80 tons of Bartlett pears this season from 10 acres. This should net him about $330 a ton at this year's prices. Mr. Lyon claims that if he had had water for irrigation he could have greatly increased his tonnage.

Serious Storm Damage in the Santa Clara

[Written for Pacific Rural Press by John J. Fox.]

After a special trip of observation through the prune section of the Santa Clara Valley, the writer can only remark, "The half has not been told" at this writing (September 16). If 25 per cent of the crop of prunes is saved here, it will be fortunate. I visited dry yard after dry yard and orchard after orchard, at Milpitas, Santa Clara, Meridian, Saratoga, San Jose and Evergreen. To mention a few: The Sorosis orchard at Saratoga had over six acres covered with trays. The fruit is practically doomed. I do not think 10 per cent can be saved. A half company of men from the Eighth U. S. Infantry were at work here, but had been put to work picking peaches.

FRUIT MADE MUSHY BY RAINS.

The prune trays had all been canted up to keep them off the ground, but in many places you could run your finger through the assembled fruit like so much jam—fermented clear through. Lester Bros., at Meridian, had 3500 trays of fruit out. It is practically all gone and the fruit on the ground is much of it green with mould—impossible to save it. Bradford & McClay, in the Evergreen section, will save, they think, about 40 tons dried out of an expected 250 tons. They are trying running a small evaporator so far as it will go; also shifting the fruit to dry trays. Only half of their fruit is on the trays, the balance being on the trees or on the ground. And there it lies. The women and children have not been able to pick, as the ground was too wet and muddy.

REPORT OF PRUNE AND APRICOT ASSOCIATION.

The Prune and Apricot Growers' Association has made an exhaustive survey of the orchards and dry yards in the valley and have definitely concluded that it will be impossible to make any good prune product from any possible salvage of badly damaged fruit. This decision was arrived at owing to the fermentation that has set in and penetrated the meat, destroying its sugar content. The value of any further work the growers may do is so problematical that no further recommendations are being made by the association.

Though a large portion, perhaps more than half, of the crop was on the trays, most of the rest was in the orchards and a negligible quantity in the bins. Latest reports from Butte county is 33⅓ per cent loss, and other Sacramento Valley sections report similar loss. But with the good weather they are likely to get the damage will probably be no greater than has been reported. Visalia had no rain and is safe. Napa and Sonoma have not been so badly hit as the Santa Clara Valley, but bad weather conditions, fogs, etc., may still do damage.

GROWERS UNDISMAYED.

The one bright circumstance to be noted is the grit displayed by the growers in meeting the situation and doing all that can be done to save the fruit. Not a single man that I saw was lying down to it, though the loss is grievous. Every man was at work trying to do the best he knew how.

A. C. Kuhn of Evergreen, near San Jose, sulphured some of his fruit, but wasn't satisfied. Now he is dipping everything over again and will sort out the good stuff later. It is too far gone and too tender skinned to be pawed over on the trays and when dumped is simply shaken out into place.

THE SILVER LINING.

The young 'cot trees are making new growth and this disastrous rain has certainly saved thousands of trees that would have gone up if we had a dry fall and put all the others in good shape for next season. It is an ill wind that blows nobody any good.

Conditions in the San Joaquin.

San Joaquin County Commissioner Harry Ladd reports as follows: "Table grapes in this county are hurt very badly in some vineyards where the crop is low on the ground; in others, where the grapes hang high and the bunches are loose, there is very little damage. The wine grape situation is as follows: Zinfandels are practically ruined, while Missions are not hurt much. Some of the Bouschet are hurt quite badly

Fertilize Fertilize Fertilize

HAUSER'S ORGANIC FERTILIZERS

Blood, Bone and Tankage properly applied will increase your crop production. It's your patriotic duty to do this for bumper crops are necessary in Our Country's program of winning the War.

Organic Fertilizers contain real plant food and our modern equipment insures the proper grinding and mixing, thus facilitating the leaching out process when placed in your soil.

Our fertilizer booklet will be sent on application, our agent is at your service.

where down on the ground. Tomatoes are being rushed to the canneries and most ripe fruit will be saved. The general crop for the fall will be helped. Only the early harvested beans are hurt and these only in small quantity. Almonds were about all harvested before the rain. Others will be discolored some, but I do not think any will be spoiled."

Rains Not an Unmixed Evil.

J. C. Loomis of Modesto writes as follows: "The rain has done great damage to local bean crop, estimates varying from 100 per cent loss to 50 per cent on early planted beans. Many growers say that their beans are sprouting right in the pod. Hay damaged some, but rain will add considerable to season's tonnage if it can be cured later, as land was dry and last cutting would have been short. While the rains have caused heavy losses here, they will stimulate alfalfa planting 100 per cent this fall."

Napa's Loss Comparatively Light.

Henry Wheatley of Napa sends in the following word: "It is at present impossible to state just what damage will result from the rain, as much depends upon the weather during the next week. If we have fair drying weather from now on, probably 10 to 15 per cent will cover our loss, but with continued dull weather or another rain it might go to 50 per cent, as most of the fruit on the trays is in a very unsafe condition."

HORTICULTURAL NOTES.

As high as $300 per tons is being paid for olives this season.

W. E. York, an old prune grower of St. Helena, says he has for 20 years grown prunes here without irrigation. His trees this year are breaking down.

While the exact degree of damage to the raisins caused by recent showers has not yet been determined, it is quite generally believed that it will be very slight.

Peach exports to Canada from the United States will be permitted by license from the War Trade Board.

The Oakdale almond crop this season is the largest in the history of that district.

Shipments of California table grapes to Eastern markets will be reduced 50 per cent as a result of the damage from the recent rain, says the secretary of the State Commission of Viticulture. Growers will lose heavily.

Approximately 13,000 tons of California dried peaches, representing 65 per cent of the peach crop of the State, have been secured for Government purpose, the Federal Food Administration for California has announced.

Two hundred soldiers from Camp Fremont have been put to work throughout the Santa Clara Valley gathering the prune crop, which has been badly damaged by the recent rainstorm. Up to 2000 men, as needed, have been offered the growers by the War Department.

The Fresno district peach crop was pretty well under shelter, about 50 per cent of the crop being in the packing houses, according to the secretary of the California Peach Growers. A large part of the remainder is under sheds, and other quantities are boxed and covered.

The marmalade factory established by Crawford & Co. at Anaheim for two or three years has grown rapidly. Plans are now being made by Exchange members to take over this plant and operate it through the General Exchange. All culls will be accepted at the local houses and the proceeds prorated among the growers.

Lodi received the heaviest rainfall for the month of September that it has had in years. The total for the season is 3.29 inches, all of which fell this month. The rain did severe damage to the grapes. If the weather stays damp and rainy it means the grapes will mold and rot, while on the other hand if it turns dry and a cool wind blows for a few days the bunches will dry out somewhat and a great many can be shipped.

"I Bought That Truck with Dynamite"

"I need it too, I can tell you. I'm getting more fruit this year than my horses could ever move to market.

"Why do I say I bought it with dynamite? Because if it hadn't been for Hercules Dynamite I never would have had the money to buy it. I wouldn't have needed it anyway because I wouldn't have had the fruit to haul I have now.

HERCULES DYNAMITE

is responsible for my bumper crops. To begin with I plant the trees in blasted holes instead of spade-dug holes. As a result my trees bear a year earlier than they ordinarily would. They give finer fruit and more of it year after year. The death rate is unusually low too. You never saw such healthy orchards.

"Then I help keep them healthy with Hercules Dynamite by cultivating the soil down around the ends of the roots so they grow better. I tell you it pays at all points. That motor truck proves it."

You ought to use dynamite yourself. There is a book, "Progressive Cultivation," that tells all about it. The reading of it will mean money in your pocket. It is sent free on request. Mail the coupon below, *today*.

Alfalfa Grows on Swamp Land

[Written for Pacific Rural Press by R. E. Hodges.]

Many a man is afraid to buy a tractor because there are wet spots in his fields. Many a man runs tillage implements through wet spots year after year, using extra power to do it and extra seed to plant those spots and perhaps extra power or difficulty harvesting around them; but he gets nothing off from them except in such a dry year as the present. They are often the richest spots in plant food, but at the same time may also be too alkaline to grow crops even when not too wet. Generally these spots that are now farmed at great expense for nothing could be drained and the alkali more or less removed at a cost that would be repaid by the first two or three crops. The crops themselves would be practically clear profit, for they would require little more work than is now put on them.

When L. B. Dutton looked over the ranch that is now his in Santa Clara county, he found a willow swamp of two or three acres in one part of which he unexpectedly fell into a twelve-foot hole and only saved himself by grabbing one of the willows. He has found half a dozen springs in that swamp which now run a six-inch drain-tile nearly full all the year around, except as noted below. The water-table stood about 18 inches under the surface as an average for the whole ranch.

Before buying the place, Mr. Dutton bored 12 feet deep at various places and 14 feet at one place. He found sediment adobe, gradually changing to solid black adobe, at 18 inches. This was about 10 or 11 feet thick and resting on disintegrated sandstone 18 to 24 inches thick lying on solid rock of the same nature as rock in the mountains a few miles away. This rock probably forms the bottom of a bowl which drains water from far away to the district in which Mr. Dutton lives. In addition to this, the creek has overflowed his 75 acres of alfalfa and young pears twice in the past three years, so it was like a sea. Yet the alfalfa on that 75 acres produces tall, uniform, heavy crops, its roots go 3½ to 4 feet deep, and the young pear trees which were planted a year ago last spring look generally thrifty. Where they are not so good as the rest is where more surface dirt was taken off in leveling. The pear trees were planted in the alfalfa before the tile got in its full effect, and the digging showed alfalfa roots rotted off a foot below the surface. Alfalfa now feeds to the bottom of the drains.

SYSTEM OF INSTALLATION.

The 75 acres have a uniform slope of about 4 inches per 100 feet, high places having been graded into low ones. About 25,000 feet of 4-inch tile were laid uniformly 4 feet deep in straight lines 132 feet apart and emptying into a straight main on one side of the field, starting at its upper end with 5-inch tile 4 feet deep and enlarging to 12-inch tile 9 feet deep. A manhole was put into this main drain about every 500 feet and another was put into the swamp with several laterals leading to it and a 6-inch line leading out of it. The ditches were dug by a machine which made them 14 inches wide and 4 feet deep as fast as a slow walk, throwing dirt up on one side. Grade stakes had been set up on a definite level, so the operator could sight over them from his seat and raise or lower the digger to keep the bottom of the ditch practically on the same grade regardless of irregularities of the surface.

STOPPAGE BY ROOTS.

The only trouble with the tile is stoppage by roots, especially where weeds replaced alfalfa in the swamp. Alfalfa was planted in the spring of 1916 before the drains had taken full effect on the swamp, and weeds choked out a good deal of it on that area. The weed roots have choked the drains more or less and have thus added to the moisture and favored their own growth while injuring what alfalfa is left. Mr. Dutton is not certain that alfalfa roots stay out of the drains, but the drains have choked up at only one place and it seems reasonable that alfalfa roots which rot off where soil is not well drained would stay out of drain tile. The roots in the tiling always become slimy and wash out in the spring time, presumably having rotted through the winter. But because they have stayed in the tile all winter they have prevented drainage when the most water is on the ground. Roots have been cleaned out by digging out a few sections of tile at intervals and pulling a home-made cleaner through. The cleaner is a wooden plug about 6 inches long and 1½ inches in diameter, with nails driven through and projecting from its sides. A wire is pushed through as far as possible and tile are dug up there at its forward end. The cleaner is then hooked on and pulled through. But it costs more to clean out than did the original installation. Perhaps more manholes at the troublous places would make cleaning cheaper. But, regardless of these minor troubles, Mr. Dutton has a fine alfalfa field where alfalfa could not thrive without drainage, and he has thrifty pear trees which are enabled to make use of 4 feet of fertile soil because excess water is quickly removed.

Water Enough, but Not Too Much, is Ideal and Practicable

PLANTS must have water enough to dissolve and greatly dilute the elements of fertility. But water must not fill all the spaces between soil particles, for that kills the bacteria which are necessary to make the elements of fertility soluble. Water which would settle by gravity through the soil is a detriment to plant growth. It should be removed. No way of removing it is equal in permanence and convenience to tiling. Tile cannot remove water that would benefit the crops. Now, while the best footing can be had, is the time to put in drains to make wet spots productive and not a cultural detriment to the field.

This article tells of a case where alfalfa grows vigorously on adobe land overflowed like a sea in two winters out of three. Its roots feed almost to the bottom of drain tile laid four feet deep and 132 feet apart. Before the tile got in their good work, alfalfa roots rotted off a foot below the surface, and standing water averaged 18 inches below the surface. They now feed almost to the bottom of this drain tile laid four feet deep and 132 feet apart.

COLUSA RICE ACREAGE BIG.

Rice in the Colusa district is generally in as good condition as last year and there is double the acreage of 1917, according to J. G. Zumwalt of Colusa. About a quarter of the land owners have suffered for water, but there is not over 10 per cent loss. The S. V. I. Co. has 26,000 acres of rice.

We saw an old almond orchard near Paso Robles brought back into profitable bearing by being heavily cut back for new wood and thoroughly sprayed. The only criticism we have to make is that the large cuts were not properly protected and finished.

Barley Market Will Continue Low

THE committee appointed by the California Grain Growers' Association to investigate the possibility of selling this year's barley at fair prices reported, through Chairman T. A. Kilkenney of Dixon, to the "Association" at Sacramento as follows: The present low price is due to (1) an abnormal barley crop produced in the Middle West on account of last winter's high prices; (2) the abnormal wheat crop, which reduces the demand for export barley; (3) a diminished demand for brewing; (4) a diminished demand for horse feed on account of tractors and trucks; (5) a diminished demand for barley as a human food; (6) elimination of speculative buying due to the fixing of middlemen's profits by Food Administration action. While the California barley yield per acre is subnormal and the cost of production abnormal, all that can be hoped for is the Galveston or New Orleans price, less cost of transportation and handling. There is little demand for barley in this market or any other. The committee recommends planting wheat wherever it will do well, as the price of wheat is fixed for next year. This is the more important from the growers' standpoint on account of President Wilson's suggestion, as mentioned by J. L. Davis of Madera, that he did not set the price of wheat for two years because if the war ends in 1919 the Government would lose $500,000,000 due to the immense stocks of wheat in remote countries. This indicates that the authorities figure on a lower price of wheat at the end of the war, and incidentally the prices of other grains will go down accordingly. This was said as a point showing the necessity of growers organizing to save the industry from reaction.

Start Right to Grow More

NEVER before has there been so loud a call for more and still more grain, coming from all points of the compass. Never did you face so great an opportunity to help the world and yourself. Never were good tillage tools so necessary!

Good tillage implements—like **Deering, McCormick** and **Osborne** disk harrows, peg and spring-tooth harrows, cultivators, etc.—make mellow, uniform seed beds, free from lumps, moisture-holding, allowing crops to grow to vigorous full yield. Real cultivation means more bushels and more dollars, and the dollars will pay for your investment.

Deering, McCormick and **Osborne** disk harrows have these big, new improvements: The **Third Lever**, which controls the depth of penetration, regardless of soil condition. The **Exclusive Attachment of the Tandem**, which forces the tandem always to cut the ridges left by leading gangs, yet allows perfect flexibility at turns.

Remember the other tried and thoroughly-satisfactory features—built-in angle steel weight boxes; adjustable forecarriage; tall, hard oilers, convenient and protected; 4-wear wood bushings, improved scrapers, etc.

This year every added bushel counts doubly. Start right with right seed beds. See the local dealer and write us now about **Deering, McCormick** and **Osborne** tillage tools.

ALFALFA SEED

Our plant and seed cleaning machinery are so located and equipped as to make us the most important dealers in Alfalfa Seed and other field seeds. In procuring Alfalfa Seed, we cover the entire country, selecting our stocks from the best districts. This seed is then cleaned up to our standard of purity, which is seldom, if ever, equalled by others. It behooves all buyers to obtain our samples and prices before buying elsewhere.

MELILOTUS INDICA

This clover has become the greatest cover crop of all. We are headquarters. Samples and prices on request.

Valley Seed Company

PHONE MAIN 585

How many kills to YOUR *shot pattern?*

MOST hunters agree that three shots or more are essential to a *kill*. Less than three may mean a *cripple*, no matter what the size of shot or its velocity. Hence uniform pattern, i. e., an even spread of shot is essential to successful shooting, in the field or at the traps.

The secret of good patterns is in the *control* of the powder explosion. Good, evenly distributed patterns are the direct results of a correct system of wadding scientifically adjusted to the bore of the gun and the load. The wadding, like the piston head of a gas engine, must give the explosion something solid to work against, so that the shot may be *pushed* out evenly.

It must expand and fill the tube of the barrel, completely sealing in the gas behind it. No gas must escape to scatter the shot.

It must offer just the right amount of resistance to the explosion so as to develop uniform pressure and high velocity without danger of jamming the pellets out of shape at the "choke" or muzzle constriction.

The Winchester System

Winchester Wadding is the result of repeated experiments to determine the most efficient control of the gas blast.

The special construction of the Winchester *Base Wad* gives what is known as *Progressive Combustion* to the powder charge.

Combustion spreads instantly through the powder charge. By the time the top grains of powder become ignited the *full* energy of the burning powder behind is at work.

Though the explosion is almost instantaneous, it is none the less *Progressive*, the final energy and maximum *velocity* of the completely burned powder being developed at the *muzzle* where it is most needed.

Meanwhile, under the heat and pressure of combustion, the tough, springy, *Winchester Driving Wad* has expanded to fill the barrel snugly all around. No gas escapes. It is completely sealed in. The wadding *pushes* the shot evenly.

At the muzzle the shot pellets slip out without jamming while the wadding is checked for a brief interval by the constriction of the muzzle. *It follows some distance behind the shot pattern.*

The shot cluster travels on unbroken by gas blast or wadding and makes the hard hitting, uniform pattern for which Winchester shot shells are world famous.

Fish Tail Flash. All Winchester smokeless shells are made with the new Winchester Primer—the quickest and most powerful shot shell primer made. Its broad *fish tail* flash gives even and thorough ignition. Every grain of powder is completely burned up before the shot charge leaves the muzzle.

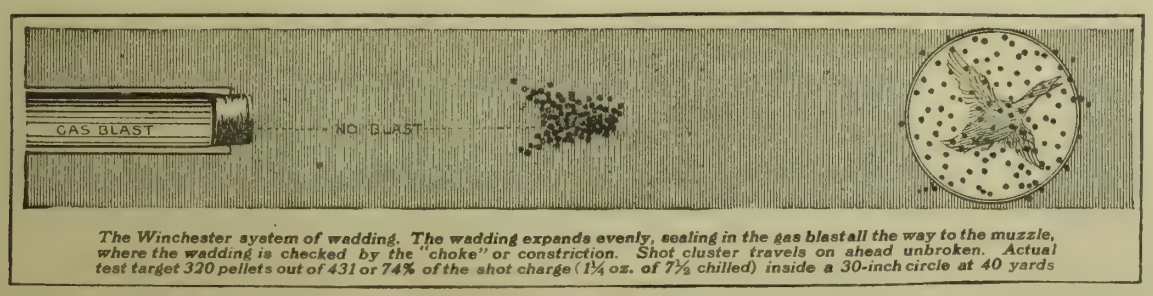
The Crimp. The required degree of pressure necessary in seating the driving wads is worked out in combination with the *hardness* or the *softness* of the *crimping* required for any particular shell.

Waterproofing and lubrication. In the cold damp air of the marshes, or under the blazing sun at the traps, Winchester shells will always play true. Winchester waterproofing process prevents them from swelling from dampness. Special lubrication of the paper fibres prevents brittleness and splitting in dry weather.

Uniform shells. From primer to crimp, Winchester shells are constructed to insure the maximum pattern possible from any load and under all conditions. $100,000 is spent annually in the inspection and testing of finished shot shells. 25,000,000 rounds of ammunition are fired every year in testing guns and ammunition.

Clean hits and more of them

To insure more hits and cleaner hits in the field or at the traps be sure your shells are Winchester Leader and Repeater for Smokeless; Nublack and New Rival for Black Powder. Write for our Free Booklet on Shells. **Winchester Repeating Arms Co., Dept. Y-11. New Haven, Conn., U. S. A.**



The Winchester system of wadding. The wadding expands evenly, sealing in the gas blast all the way to the muzzle, where the wadding is checked by the "choke" or constriction. Shot cluster travels on ahead unbroken. Actual test target 320 pellets out of 431 or 74% of the shot charge (1¼ oz. of 7½ chilled) inside a 30-inch circle at 40 yards

GROZ-IT

HIGHLY
Concentrated - Pulverized

Manure

A mixture of cattle and sheep manure from animals fed on cotton seed meal and cake and alfalfa (highly nitrogenous foods) aged for several years under climate conditions that remove moisture but prevent leaching and fermenting.

No odor.
No flies or insects.
No weed seed or foreign matter.
Many times plant food values of ordinary manure.
Guaranteed contents.
Nitrogen, 1.5 to 2%.
Phos. Acid, P^2O^5, 1.25 to 2%.
Potash K^2O water soluble, 4 to 5%.

We are shipping GROZ-IT in immense quantities to Southern and Eastern states, where present freight rates make it $10 per ton more than cost to you.
Place your order now to insure delivery.
Sold in bags or bulk.
Write for circular and prices.

Field and Garden Notes

Imperial Grain Growing.

Imperial county grain growers do not worry about packing the subsurface soil even after subsoiling eight to eighteen inches deep, as many are now doing instead of plowing. They settle the seedbed with water after plowing or subsoiling dry, according to B. D. Irving of that county. After the irrigation, the land is disked two to four inches deep and a "float" smoothes it to level up for irrigation. The soil is generally heavy, and when disked after irrigation is left in small clods, which dry out. To get seed into soil sufficiently moist to bring it up would require such deep planting that it could not come up in a good stand. It is, therefore, drilled shallow and flooded to bring it up. Baking is pretty well avoided by irrigation every two to four weeks, depending on the weather.

Enough Bean Bags Available.

Enough bean bags are available already in California for the crop, which will not be larger than last year, though the acreage was increased, as stated by E. H. Ward of the W. A. Plummer Mfg. Co. However, dealers have not been buying so much as usual on account of the small margin fixed by the Food Administration Grain Corporation agreement. The old standard 18x32 ten-ounce burlap bags, holding 80 to 85 pounds, are quoted to growers at 21½c each, dealers being allowed one cent profit. But on account of bursting and tearing of these light weight bags the 19½x34 twelve-ounce burlap 100-pound bags have come into general use. These are quoted at 26 cents to the grower. Both prices are in bales of 500 each at San Francisco.

Selling Beans to Government.

To the Editor: Whom should we address to sell our crop of beans to the Government?—A. M., Los Angeles.

[The Government is not buying old beans. For the new crop, H. Clay Miller of the California Food Administration, San Francisco, is the buying agent. He will appoint local committees to inspect and receive the beans. What the Government and allies will require is not now known, but there is no intention to fix a price on any beans except those which the Government and allies shall actually buy.]

Horsepower for Threshers.

To the Editor: What horsepower is required to run Case stationary grain threshers?—Subscriber.

[It is generally figured that a Case separator alone requires about a horsepower per inch length of the cylinder, according to Mr. Brown of that company. Blowers require five to ten horsepower additional, depending on weight, amount and dryness of straw and size of separator; and the feeders require two to six horsepower.]

Lake County Bean Cannery.

A. Mendenhall, who owns the Clear Lake cannery at Upper Lake, says he has the beans to furnish work for double the help he is able to get. He is now putting up about 700 cases per day, but could put up 1600 if he had help enough. The principal variety is the crease-back, seed of which were brought over here from Iowa by his father in 1852.

Potatoes, Fifty to One.

Fifty pounds of potatoes per pound planted was the experience of Frank Silliman of Santa Cruz county with H. A. Hyde's Oregon strain, Pride of Multnomah and White Star seed potatoes. One hundred pounds of each were planted under commercial conditions as a trial in Mr. Silliman's regular fields.

Hay Shippers' License.

Farmers shipping hay produced by themselves are not required to have a license under the food control bill, but failure to secure a license before engaging in hay shipping as a business is punishable by fine and imprisonment.

Beware of substitutes!
Buy the original Germain's

Hairy Peruvian ALFALFA

direct from the introducers!

For your *own protection* order *ONLY* Germain's specially-selected, proven, tested, pedigreed, true-to-type Hairy Peruvian seed. Our supply is limited and we may be over-sold in double quick time. To avoid disappointments place your order at once. Wire, telephone or write for a reservation of seed, stating amount wanted—or call personally if you can. Orders will be filled in the order in which they are received.

Regardless of whether you intend to plant this fall or next spring, we advise you to buy your seed now. Increasing demand means increased prices. Hairy Peruvian is rapidly displacing all other alfalfa varieties.

Special Germain's Hairy Peruvian folder upon request.

Before planting, inoculate seed with FARMOGERM and in sure a quicker growth, a larger crop and earlier maturity.

Agricultural Notes

DATES OF FAIRS.

Dates for fairs in California are:
Oakland Land Show and Exposition—September 9-October 6.
Fresno County, Fresno—October 1-5.
Southern California, Riverside—October 8-12.
California Liberty, Exposition Park, Los Angeles—October 12-26.
Livestock Show, San Francisco—Nov. 2-10.

Placer county has fourteen boys and girls' clubs raising vegetables, poultry, pigs, rabbits, and sorghums.

The Caruthers tomato cannery is paying $14 per ton for tomatoes; $15 is paid on contracted crops.

Raisin City dairymen are "up against it" on account of the help situation. Some will soon have to quit.

The Delta Farms Reclamation District recently voted $560,000 bonds for the purpose of putting up 13 miles of levees.

Farmers near Raisin City are selling alfalfa in the stack at $16; $20 is being received for first-class baled alfalfa on the cars.

Walnuts in the Goleta district of Santa Barbara county show some effect of blight; but the yield is likely to be around normal tonnage. Last year it was above normal per acre.

Rains early in September in the Palo Verde Valley, Riverside county, are reported to have washed cotton aphis out of existence and insured a good crop without further irrigation.

Irrigation canal leakage draining into an old lake bed has kept one crop of rice in Stanislaus county growing thriftily while others on higher ground were not getting enough water.

A bumper crop of Chevalier barley in the Salinas district was lying in bundles in the fields when the rain came. The fields were rather miry, for nearly six inches of rain fell in three days.

Lompoc Valley bean threshing started this week in the higher fields, as beans on the valley floor are always somewhat later. Large threshers are more numerous this year than heretofore.

Lima beans around Goleta are a light crop, with considerable vines. A yield of seven or eight sacks per acre is estimated. Some fields not yet cut are making a second growth, which will interfere with harvesting.

There were 90,779 bags of beans in storage, September 1, in San Francisco and Oakland warehouses. Receipts for the month previous were 30,401 bags, according to Chief Grain Inspector Henry C. Bunker of San Francisco.

A. H. King, gardener for the St. Helena Sanitorium, has some very fine lima beans, a variety which is not supposed to grow very well in this part of the State. Mr. King says he can succeed only with the pole variety. The bunch ones do not do well.

Cotton boll worm and the tarnished bug do some injury to cotton in all sections of the State, but boll weevil has not yet been introduced. Thrips are reported as the cause of some dropping of leaves and squares in the Fresno Egyptian cotton district.

Scott Miller has proved the climate of Templeton, San Luis Obispo county, good for Bermuda onion seed by raising two acres of the plumpest kind of seed. G. A. Nehrhood proposes to grow five acres next year. They have no irrigation but a rather foggy climate.

Santa Ana growers claim that California's walnut crop will be the bumper one this year. It is also predicted that it will command a higher price than last year. In the last few weeks early crop estimates have been revised and it is now thought that No. 2 nuts will run about 5 per cent and Jumbos about the same.

The first lima beans to be sold around Santa Ana, Orange county, were those sold from the Irvine ranch early in September at 11½c and 12c. This ranch annually plants about 23,000 acres of limas, mostly without irrigation. The yield this year is expected to be about nine sacks per acre, as against seven and a half sacks last year.

Loss of over 4,000,000 bales of cotton by drouth during July and August throughout the cotton belt, but particularly in Texas and Oklahoma, is indicated by Government forecasts. Present conditions indicate the equivalent of about 11,000,000 500-pound bales. The acreage planted was next to the largest ever. Arizona and California crops are reported as in the best condition of any.

Styleplus Week the nation over

Copyright 1918 Henry Sonneborn & Co., Inc.

America's only known-priced clothes

Now going on—this Fall season exhibit—staged in every city and town where Styleplus Clothes are sold.

While thousands of Styleplus suits will be sold, the big object is to show the public what values we can produce by centering our volume on a few grades, thus permitting us to manufacture scientifically at low cost.

This season when clothing prices are *up* you can buy a Styleplus at a price never considered unreasonable for a good suit of clothes. The Styleplus plan of supplying reliable quality at known price helps you more than ever in times like these.

Wear Styleplus Clothes and you march in Uncle Sam's great thrift army because you make both sides of your dollar count. Visit a Styleplus Store during the coming week.

Sold by one leading clothing merchant in most cities and towns. Write us (Dept. AA) for Styleplus booklet and name of local dealer.

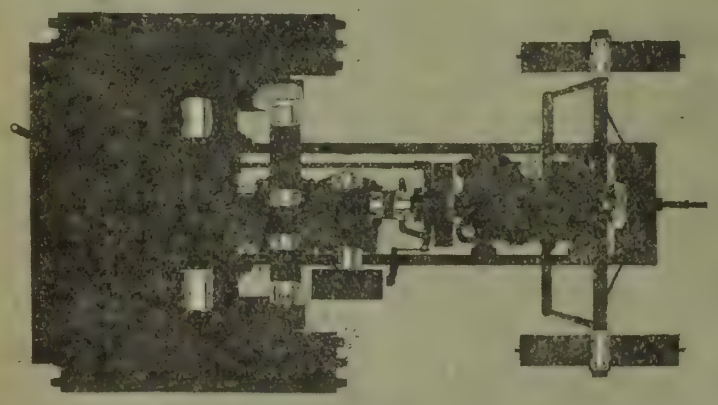
MANUFACTURED BY

THE HOMER LAUGHLIN ENGINEERING CORPORATION

2652 Long Beach Avenue, Los Angeles

The LAUSON 15-25

DUST PROOF-ALL GEARS ENCLOSED



The Full Jewelled Tractor

Every one knows the value of the watch with the "Full Jewelled Movement"—it can be depended upon. In the LAUSON 15-25 we have followed the full jewelled idea by equipping it with 24 sets of Hyatt and Timken heavy duty Roller and Ball Bearings. These mean to the tractor what the jewels mean to the watch movement. They insure easy running, no friction, dependability, long life, power.

Combined with LAUSON dust-proof design—all gears enclosed and running in oil—and LAUSON rugged construction, the LAUSON owner has real tractor insurance for field or belt work, year after year.

Full particulars about the LAUSON 15-25—the economical farm power unit for all farm work—will be sent on request. Our nearest Sales and Service Station will gladly arrange a demonstration on your farm.

Builders of Lauson Frost King Engines

For twenty-three years LAUSON Frost King Engines have been the standard of farm engine excellence— 1½ H. P. to 28 H. P.

THE DE LAVAL DAIRY SUPPLY CO., SAN FRANCISCO, CAL.

State Fair Machinery Observations

(Concluded from last week.)

Fairbanks Semi-Diesel Engine.

The semi-Diesel engine operated by Fairbanks-Morse & Co. throughout the Fair time attracted much favorable comment. Though of 15 horsepower, and burning low grade fuel, it was almost noiseless, no vibration was noticeable, and the exhaust was clean. It was cooled by connection with city water, and the waterjacket stood around 90 degrees F. The engine was reversed and ran equally well, apparently It was hitched to a long line-shaft running several dead engines and a centrifugal pump which kept a waterfall running over a weir.

Waterloo Boy Owned by Deere.

The Waterloo Boy 12-25, now owned by the John Deere Plow Co., was on exhibit, hitched to a Van Brunt seed drill about 10 feet long. This tractor has four wheels, three-point suspension, large internal gear drive, and two horizontal cylinders.

Emerson-Brantingham Tractors.

One of the new tractors shown at the State Fair was the Emerson-Brantingham, a four-wheel type, which has been manufactured four years in the East and is handled in California by Brock & Skidmore of Berkeley. It is of 12-20 horsepower, has four cylinders cast in pairs, large enclosed internal drive gear, coal oil burning attachment, transmission and differential all together in one casing, very heavy crank case and engine to reduce vibration, gear-driven fan, connecting-rod bearings three inches wide and held together by four bolts instead of the two commonly used. A self-steering attachment is available but scarcely necessary, as the machine keeps well in line.

Power-Adjustable Double Disk.

A specially ingenious yet simple labor saver seen during the Fair is the power-adjusting Roderick Lean double disk harrow, by which the tractor driver from his seat loosens a lever ratchet, backs the tractor to set the disk at an angle and goes ahead. At the headlands, if he does not want to repeatedly make the turn under full load of angled disks, uselessly chewing up soil already cut to powder, he simply loosens the ratchet without getting off the tractor and the angle of the disks straightens out. It is said by Western Manager R. B. Wheeler of the Roderick Lean Co. to be the only automatic disk harrow on the market. The power adjustment is obtained by means of a clevis as long as the angle-iron tongue of the harrow (about two feet), which slides forward and backward in the tongue, being engaged and released by the lever ratchet mentioned above. Attached to the sliding clevis by individual clevis connections are two "reaches" which operate the outer ends of the rear gangs. The clevis is also attached to the inner ends of the forward gangs. The tractor hooks into this clevis and when the ratchet is loosened it pulls forward and straightens the disks. When the tractor backs up and the ratchet is engaged to the tongue, as soon as the tractor moves forward it pulls the disks by means of reaches from the tongue to the outer ends of the front disks and the inner ends of the rear disks to their working angle up to 20 degrees. The clevis connections for the "reaches" between forward and rear disks provide full universal joints and entire flexibility. Roderick Lean tillage implements of all kinds except plows, though long well known in the East, are comparatively new to Western farmers, but will soon be on the market everywhere.

The Walking Tractor.

Fageol tractors, invented by R. Hamilton, a Sonoma county vineyardist for his own work and especially for muddy soil, have been elaborated during the past two years by the Fageol Motors Co. into commercial durability. The engines run 1200 r. p. m., developing 18 horsepower and 1000 to 3000 pounds on the drawbar, the equivalent of six or eight horses. They have four-foot rear wheels, each of which "walks" on 32 legs, about 10 inches long, and arranged in pairs. There is no grease cup on the machine, the working bearings being lubricated by filling the transmission case with 600W oil. The motor is furnished with usual lubrication. The factory has been putting out four or five tractors a day for the past few weeks.

Russell Rice-Bean-Grain Thresher.

The Russell rice, bean, and grain harvesters were worth a good visit. One of them, opened for inspection, has a 40-inch feeder and cylinder with the rear end 64 inches wide and carrying 16 feet of shakers and a 64-inch shake shoe. The extra width is to spread out and loosen straw so grain may fall from it within the machine. To help along with this object the 15-bar cylinder is closely followed by a four-wing beater; which does not permit straw to wrap around it. Straw passes over fingers to separate most of the grain under this beater and then proceeds to a spiral beater, which spreads it out the full width of 64 inches. From the spiral beater it is shaken toward the back over a "corrugated grain pan," which prohibits the grain and straw from standing still or coming back. Two rows of fingers crosswise of the machine toss the straw upward as it passes over them, thus further loosening it. The grain pan is braced lengthwise and crosswise to prevent any sagging, which would deliver grain unevenly to the cleaner.

Pelton Irrigation Pumps.

Pelton water wheels are known the world over; but Pelton irrigating pumps have as yet become but little known. Their exhibition at the State Fair, pumping water into a tank with direct drive connections for both electric and gas motors, was a good introduction. Their frames are cast all in one piece to avoid the wracking and loosening of bolts. Their bearings have ring oil lu-

NORWALK TIRES

1925 Merced St., Fresno

brication, recently enlarged bearings, and a new water box to automatically seal the bearing to prevent entrance of air and to keep the bearing cool.

Eight-Cylinder Tractor.

An eight-cylinder V type gas tractor, the "Common Sense," made in Minneapolis and handled in California by J. O. Humphrey of Oakland, has a single bull wheel behind with two steering wheels in front. It has a chain drive on each side of the bull wheel from the 40-horsepower motor. On high, at the rated speed of 1200 r. p. m., it makes 3½ miles per hour. A leveling screw keeps the outfit level with one wheel in the furrow. The tractor weighs 6000 pounds, has a wheel base of 9 feet, 7½ feet wide in front and 4 feet in the rear, and 6 feet tall, the highest point being the cover over the bull wheel.

Exhaust Cools Radiators.

Tractor radiators cooled by use of the exhaust are the ones used on most of the Avery sizes. They are composed of vertical copper tubes in circles, with an open circle several inches in diameter in the center. Upward into this open center the exhaust escapes, drawing cool air past the tubes from all sides without use of a fan.

Caterpillar Track Improvements.

Caterpillar tractor track links have been in two pieces bolted to the shoe plates. As these persisted in twisting and loosening the bolts, an improvement has been made which eliminates this difficulty. The two pieces are cast as parts of a malleable plate casting, which fits a considerable area of the under side of the shoe and when bolted on cannot be twisted.

One-Man Tractor Harvester.

We can run a Case tractor 20 feet ahead of us "in case" we ride on the I. H. C. grain binder in the tractor tent containing the regiment of Cases. This binder is hitched by a long tongue to the tractor, which is steered by square rod universal joints which reach from a bevel gear on the steering post of the tractor back to the seat on the harvester.

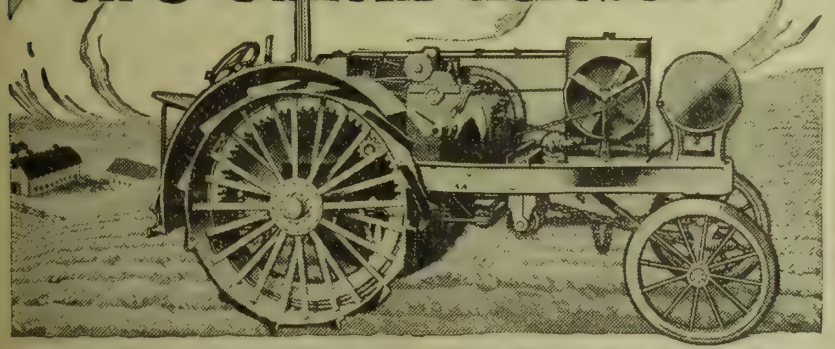
I H C Tractor Improvements.

Changes made in the International Harvester Co.'s 8-16 model include an Ensign carbureter instead of the "mixer," a vertical high air intake instead of the low horizontal one which previously allowed too much dust to get in, levers forward from the seat rather than backward from it. This engine has a four-cylinder motor lubricated solely by a force-feed system which drips used oil onto the ground or into a receptacle. The chain drive is not lubricated even with the waste oil.

TRACTOR COURSE. NOV. 11-19.

The tractor short courses to be held at University Farm, Davis, November 11 to 19 and November 20 to 22, are of two different natures, one for beginners, one for experienced men. At least ten of the best makes of tractors will be used for practice work in the beginners' course, which will be similar to those held at Davis in 1916 and 1917 and at Riverside in 1918. It covers the fundamental principles of engine operation and repairs and of tractor driving. The experienced men's course, lasting three days, is more in the nature of a conference to bring every student up to date on tractor improvements and practice. Demonstration of repair jobs will be a feature. Enrollment costs $1. Rooms and board may be had at University Farm dormitories and cafeteria or elsewhere, as desired. Only 180 can enroll in the beginners' course, enrollment being in order of application to the Dean, University Farm, Davis. Those taking the beginners' course may remain for the other. The growth of these courses has been phenomenal and a great many will be disappointed when they apply too late.

Plowing Record 8 Acres per Day on 8 Gallons Kerosene



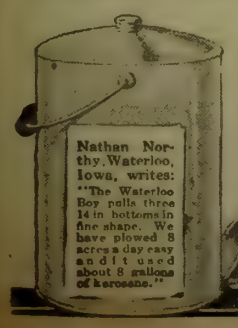
WATERLOO BOY

Original Kerosene Tractor

The Waterloo Boy plows more miles of furrow per dollar of fuel cost, because our patented, inbuilt kerosene manifold is different from every other. It refines kerosene into a powerful explosive gas—gets full power from every drop of fuel.

Excess Power for Emergencies

The Waterloo Boy has demonstrated its ability to do good work in all soil conditions—gumbo, hard pan, sod and flooded land—uphill and downhill. Guaranteed 25 H. P. at belt is ample for threshing, silo filling, etc.



Easy operation and long life are assured by simple, strong construction; perfect automatic lubrication, dust proof gears, bearings and wheels, reliable ignition, Hyatt Roller Bearings throughout, complete accessibility of working parts.

It will pay you to investigate this tractor.

Illustrated Catalog FREE on request. Write for it Today.

Waterloo Gasoline Engine Company

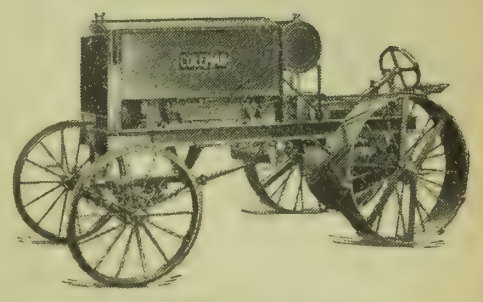
6003 W. 3rd Ave. Waterloo, Iowa

facts—

Simplest
most efficient
most dependable

The Coleman Tractor

is the **simplest** because it has fewer working parts — less parts than any other tractor of equal power rating on the market. The **worm drive** is the simplest application of direct power transmission — takes fewer parts. All the way through the tractor, the **Coleman** is simple — a feature that appeals with tremendous force to the farmer who has use for a tractor.

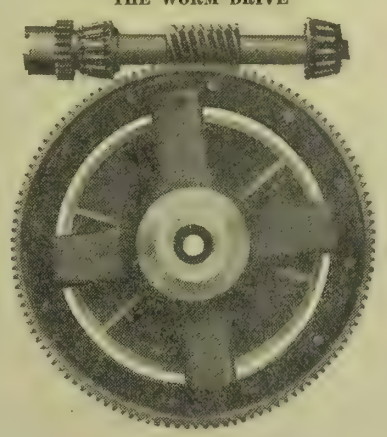


COLEMAN 16-30 H.P.

motor-power

The Coleman Motor is the famous Climax engine of four cylinders, 5-inch bore by 6½-inch stroke, and is governed to a speed of 750 r. p. m. Its full water jacket includes provisions for cooling even the spark plugs, a feature so necessary in burning Kerosene. **The Governor** is of the throttling centrifugal type, fully enclosed and easily adjustable. Oversize connecting rods and main bearings provide positive insurance against bearing trouble, and a full force-feed oiling system guarantees perfect lubricating of all wearing and moving parts at all speeds, and under all conditions. **The Cooling System** includes a well-proved type of radiator (Perfex) and a centrifugal water circulating pump. **The Pistons** are provided with leak-proof rings to give perfect compression and to prevent the fuel from leaking past the pistons into the crank case. The Climax engine, in short, is the perfect tractor engine, built to give service, under all conditions. Construction throughout is of the very best materials we are able to obtain—the very finest workmanship has been put into each part. The **Coleman Tractor** is, mechanically, as perfect a tractor as it is possible to build—and **fully guaranteed.**

THE WORM DRIVE



and so

The farmer, anxious to own a tractor insuring dependable power for all farm work, and equally anxious to escape the loss of time, labor and money that go hand in hand with a complicated tractor, will prefer the **Coleman.** It is the tractor that answers the demand of the times.

The Worm Drive. The extreme simplicity of the Coleman Tractor is due to the successful and proved application of a well-known power principle, the worm and worm gear. The old-fashioned jack screw is one of the simplest and most powerful mechanisms in existence. The Straight Line Worm Drive of the Coleman cuts fuel-consuming, machine-wearing friction, resulting in the least friction of any tractor yet built. **Guaranteed for life of the tractor.** The worm gear in the Coleman Tractor is simply the jack screw principle applied to the tractor. The famous Liberty truck used by the American Army in Europe has the worm drive. Government technical experts selected this type because it has demonstrated its superiority under the most trying conditions.

Handling the Herd Bull

[Written for Pacific Rural Press by R. H. Whitten.]

A MAN who had been arrested for abusing his mother-in-law came up before the judge for sentence, and was fined $55. "Your honor, I thought the fine was only $50 for striking a mother-in-law," he protested. "It was," the judge replied, "but now there is a $5 war tax on amusements."

How I wish that every farmer who abuses his bull could be made to pay a similar fine—war tax and all. And by abuse I mean not only beating the daylights out of the bull with a club, but also improper feeding and care, lack of exercise, overwork in breeding—in short, general mismanagement.

We read and hear much about the feeding and care of dairy cows, but few men have a true appreciation of the importance of the bull in the herd, and he does not come in for his share of attention in the study of feeding, exercise and care.

In feeding and caring for a dairy cow the results are apparent at once. But with a bull they do not begin to be apparent until his calves are born, and are not wholly apparent until the heifers come into milk. Yet it must not be forgotten that the bull is more than half the herd—a great deal more. For instance, in a herd of twenty cows the individual female influences the outcome of only one mating a year, but the bull puts his influence into twenty matings. Consequently, from a breeding standpoint the feeding and care of the bull is twenty times as important as that of any single female in the herd.

EARLY CARE PAYS.

From the birth of the young bull, or from the time a calf is bought to be grown out for a herd-header, the owner should see that he gets the best of care and feed. Too many farmers pay a long price for a very well bred calf and then allow him to practically shift for himself and mature "by guess and by gosh." Breeding and type are necessary, but no more so than size, constitutional vigor and temperament, and the most promising youngster on earth will not become a good breeder unless he is developed properly.

For the first six months the young bull should be treated the same as his sisters, except that he should be kept on skim milk longer. Heifers are generally weaned from milk at about four months, but the young bull should be kept on it for six months or longer. The aim should be to produce a growthy, thrifty animal, and this end can be secured with more certainty through the feeding of milk, with grain and good roughage like alfalfa, than in any other way.

A mixture of ground barley, middlings and oilcake meal in the proportions of 6:3:1 makes a fine grain ration for young calves, but middlings and shorts are almost unobtainable at present, so must be omitted, or one of the proprietary feeds can be substituted. A teaspoon of blood meal added to each feed will prevent scours and aid in the development of bone and muscle.

BEGIN TRAINING AT SIX MONTHS.

When the youngster is six months old he should be separated from the heifers. A light ring should be placed in his nose and he should be taught to lead and to stand when tied. Even at this age it is best to use a staff instead of the abominable chain or rope, as he will learn to keep his head up and will never know what it is to even want to come at you.

After six months he may be given a liberal allowance of roots or beet pulp, in addition to grain and all the leguminous hay he will clean up readily. Silage is not a very good feed for a growing bull and should be used sparingly. It is not recommended in large quantities for a mature bull, as it may make him an uncertain breeder. While the bull is growing he should not receive more than five pounds a day, and when full grown not more than ten to fifteen pounds. Salt should always be before the young bull, and a handful of powdered charcoal mixed with the feed occasionally will prove beneficial.

Young bulls will take all the exercise they require if turned out in a small field or a corral. It is a mistake to pamper them, and they will do better if kept out in the open air all the time, with simply a shed enclosed on three sides, as protection from the sun, rain and wind.

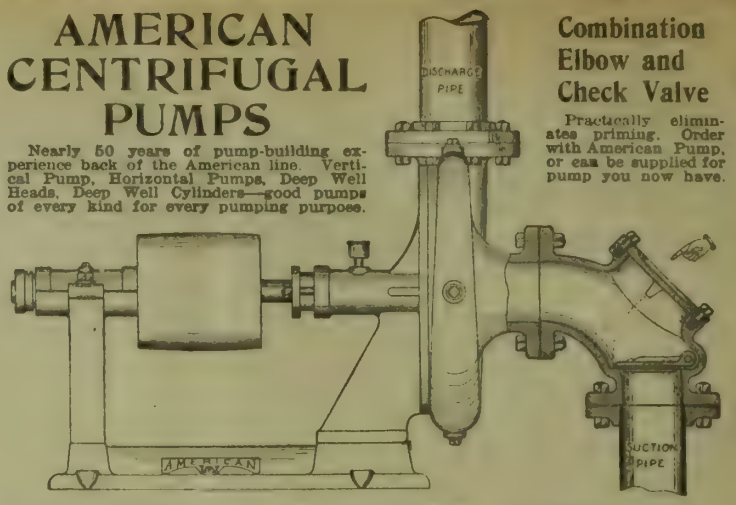
No one should be allowed to pester the growing bull. More than one good calf has been spoiled by being teased when young. This may be commenced in play, but it is sure to end in disaster.

BE PATIENT BUT FIRM.

Bulls are stubborn animals, and a world of patience is necessary in handling them. Firmness and complete mastery are also essential, and a bull should never be allowed to even suspect his own tremendous strength. Never for a moment allow him to have his own way. Always make him do things your way.

AMERICAN CENTRIFUGAL PUMPS

Nearly 50 years of pump-building experience back of the American line. Vertical Pump, Horizontal Pumps, Deep Well Heads, Deep Well Cylinders—good pumps of every kind for every pumping purpose.



Combination Elbow and Check Valve

Practically eliminates priming. Order with American Pump, or can be supplied for pump you now have.

GAS ENGINES, OIL ENGINES, MOTORS, Etc.

COMFORT ON YOUR FARM

A Pacific Redwood Water Tank

will bring you more comfort than any other thing you could install on your farm. It will save you labor. It will save you time. Think of the genuine comfort and satisfaction you'd get by having water wherever and whenever you need it.

Pacific Redwood Tanks and Pipe Lines cost less than all others and outlast them. The cost of upkeep is so small you'd never figure it.

Tell our engineering department about your needs, present water supply, distances, etc. They will gladly return an estimate on the cost of installing an outfit on your farm.

Visit our exhibit in the Manufacturers' Department, booth No. 174, Oakland Land and Industrial Exposition, September 9 to October 6.

PACIFIC TANK & PIPE CO.
THE STANDARD SINCE '88

15 Pine Street, SAN FRANCISCO
911 Trust and Savings Bldg., LOS ANGELES

This is easier said than done, and you may have a few hard struggles when the bull is young, but a stout bull lash that will snap and sting about his heels will prove a good persuader, and after he has once given in to you he will surrender more easily thereafter.

But don't attempt to whale the stuffing out of him. He will understand firmness, but he never will stand for abuse. A bull is surprisingly intelligent and quick witted, cunning and treacherous, and if he is abused he will await his chance to get even with you. And when that chance comes—look out or it will be you for the obituary columns.

WHEN TO BEGIN SERVICE.

After the bull is twelve months old he may be used for light service—say once every two weeks—but it is best not to use him much until he is about fifteen months old, and even then he should be used with extreme care. Overwork from being allowed to serve too many cows when young is a serious mistake, for it is impossible to do justice to either cows or bull, and the results are a ruined bull and an unsatisfactory crop of calves.

If handled properly during the first two years of breeding, a bull should give good service for many years. At two years he should be equal to any reasonable amount of service, but should never be allowed to serve more than two cows a day, and these services should be as far apart as possible. Don't allow him to waste his vitality by repeated service to the same cow. One good service is as good as a dozen.

FEED FOR MATURE BULLS.

After a bull has reached maturity, it is surprising how little feed it takes to maintain him in proper breeding condition. Many bulls do not receive any grain at all—nothing but alfalfa. A liberal amount of grain would improve their looks, but perhaps would lessen their potency, so their owners sacrifice looks for usefulness.

However, most mature bulls, especially during the breeding season, can make use of a reasonable amount of grain without becoming impotent, and as the more exercise a bull gets the more feed he can stand, it is much better to make him take plenty of exercise and feed him from four to eight pounds of grain a day than to allow him to become lazy and feed him nothing but alfalfa.

EXERCISE THE MOST IMPORTANT.

Exercise—that's the great factor. The average bull is short lived, and generally is sold young because he has become fat, lazy and impotent from lack of exercise. He has been kept in a bare corral, with nothing to induce him to exercise, and no bull under such conditions will exercise enough voluntarily. Consequently, some artificial means must be provided, and if this is done the bull will be kept in a vigorous physical condition and can be retained to a ripe old age.

Exercise hardens the muscles, promotes digestion and assimilation, and maintains vigor. To be effective it must be regular, and an hour's exercise daily will prove more beneficial than three hours' exercise every third day.

Various methods and contrivances have been devised for exercising bulls, such as an overhead trolley, a merry-go-round, a tread power, and work in the yoke. When the last two methods can be made to fit in with the general scheme of farming, they are to be recommended, as work is actually accomplished by using the bulls. But the overhead trolley and the merry-go-round have been used with indifferent success—or rather, a much simpler method will give as good or better results.

This is the use of a heavy barrel. Get a substantial oil or vinegar barrel and fill it with water so that it will not fall to pieces from the shrinking of the staves. Put it in the bull pen and see the fun. Perhaps you will think that the bull can't handle anything so heavy, but watch him. He will roll it all around the yard with his head and will have the time of his life. Never mind if he blusters and bellows.

(Continued on page 314.)

A home-made crate that makes the breeding of cows easier and safer.

BREEDING CRATES ADVISABLE.

No twentieth century dairyman will allow his bull to run with the herd; neither will he allow a 2000-pound bull to serve a fifteen-months-old heifer outside of a breeding crate. Many successful breeders use a crate at all times, considering it easier and safer for both cows and bull, especially in muddy weather and in cases where cows do not stand well.

Crates like the one illustrated have been used on a great many California dairy ranches with entire success. They can be cheaply made without the aid of a carpenter, but

FOR LEASE

Summer Sheep Range

Solid tract of approximately 50,000 acres logged-off lands, Butte and Tehama counties, California, for term of years beginning with season of 1919. Accessible and well watered. Estimated capacity based on previous use, 14,000 head. For particulars apply to the

The Best Equipped Live Stock Exhibit in the State will be a Feature of this Fair

Every farmer and rancher who can possibly attend this big Fair should make every effort to come, for it will be a Fair of tremendous interest to him. This will be the best equipped Live Stock Exhibit in the State—and should be of tremendous interest.

Cattle, Hogs, Sheep and Poultry Exhibits

Some of the best prize-winning stocks in the country will be exhibited at this fair. Already there are entries in every class—cattle, hogs, sheep, and poultry will be exhibited.

A Big Rodeo Horse Races

A big special feature this year is a Rodeo and Wild West Show, featuring some famous strings of horses and riders. Horse racers are a feature.

War Time Fireworks

The fireworks this year will be the display of the night signals that are being used on the battle fields. Other features for night-enjoyment are scheduled.

Food Displays

Food displays are being given much attention this year. There will be some fine exhibits in this class.

Auto Races

Auto races will be a feature the last day. Several races, with famous drivers will be run.

Auto Smash

A sensational feature — where two autos going at the rate of 50 miles an hour, crash into each other.

BREEDING SOWS BEFORE WEANING LITTERS.

To the Editor: My sows are farrowing late this fall, and I want to breed them so that they will farrow early in the spring. How can this be done without weaning the pigs too early?—A. J. L., Visalia.

[Answered by Livestock Editor.]

Instead of waiting until weaning time to take the sow away from her pigs, separate them temporarily at the time you want to breed her. Keep her away from them over night, or through the day for a few times. She will soon come in heat and can be bred just as successfully as at the customary time. If this is done, she can be left with her pigs for ten or twelve weeks instead of the usual eight weeks, if desired.

COWS HAVE INDIGESTION.

To the Editor: One of my cows first showed signs of sickness by being stiff in all four legs; did not eat much, but has never really refused feed. Now one hind foot is swollen just above the hoof and one eye is bad. Also she has trouble getting up and down. Another cow bloats every day on dry hay. Sometimes she bloats before she eats, and after eating the swelling goes down. Other times she is all right when she goes into the barn, yet we have to use the rubber hose in a few minutes. We have used the trocar on her three times.—Mrs. I. O. W., Los Molinos.

[Answered by Dr. Edward J. Creely, San Francisco.]

Both cows are sick from digestive disturbances caused from eating something that irritates the bowels. First cow is foundered, second cow has indigestion. Founder is an inflammation of the sensitive structure of the feet, and an irritation of the bowels will cause a secondary inflammation of the feet through the lymphatic system.

For founder give at one dose 1 pound glauber and 1 pound Epsom salts, dissolved in ½ gallon warm water, after which give 1 ounce saltpetre three times daily in a bran mash. Keep the hoofs wet night and day for several days. Bathe the eye with boracic acid, 1 tablespoon, water 1 quart.

The cow with indigestion should first be given 1 quart raw linseed oil, 4 tablespoons turpentine, 3 ounces sweet spirits nitre. Then twice daily give 2 tablespoons of the following mixture in 1 cup warm water.

Olive oil	1 quart
Pearson's creolin	4 ounces
Spirits turpentine	4 ounces
Sulphuric ether	4 ounces
Oil peppermint	20 drops

Give an occasional purge of salts, and be particular not to overfeed, give unaccustomed cold drinks, feed too new hay or too much straw, bran, roots, potatoes, oilcake, whole grain, chaff or weeds.

FEEDING VALUE OF SKIM MILK.

To the Editor: Please tell me how to figure the value of the skim milk I feed to hogs.—F. M., Ramona.

[Answered by Livestock Editor.]

When grain is fed in connection with skim milk, 100 pounds of the latter is worth six times the price of hogs; when no grain is used, it is worth five times as much.

To illustrate: If hogs are bringing 17 cents and you are feeding skim milk without grain, it is worth five times this amount, which is 85 cents per 100 pounds. You will see from this that at the present price of hogs skim milk has a very high feeding value.

Butterfat Contest at State Fair

[Written for Pacific Rural Press.]

The contests in the dairy production classes are always interesting and instructive. This year there were entries by the following: W. J. Higdon, Tulare; Holsteins; D. F. Conant, Modesto, Jerseys; J. E. Thorpe, Lockeford, Jerseys; J. S. Gibson Co., Williams, Holsteins; C. D. Hayworth, Modesto, Jerseys; Guy H. Miller, Modesto, Jerseys; Dr. H. W. Hand, Orland, Jerseys; S. F. Williams, Orland, Jerseys. The three-day tests were conducted under the able direction of Prof. F. W. Woll of the University Farm and the awards were made as follows:

Cows, four years or over: Higdon, Senorita Ciruela Mechthilde 3rd, 7.95 pounds; Higdon, Model Bonnie Echo, 6.79 pounds; Conant, Lady Kate's Rosette, 6.56 pounds; Conant, Mamie Owl, 6.04 pounds.

Cows, thirty months and under four years: Gibson, Queen Pontiac Ch. Korndyke, 5 pounds.

Cows, under thirty months: Miller, Lucile of Venadera, 4.70 pounds; Hand, Brilliant Jersey Queen, 4.49 pounds; Thorpe, Rose of Mossdale, 3.59 pounds; Williams, Alta La Fosse, 3.47 pounds.

Bright Prospects for Liberty Fair

[Written for Pacific Rural Press.]

We don't know what the initials of C. R. Thomas stand for, but if we were to venture a guess we would say "Certainly a Rustler." You ought to have seen this live wire at the State Fair, signing up livestock exhibitors for the Liberty Fair at Los Angeles. He secured the promise of 51 exhibitors, and of course there will be many more who did not show at Sacramento—not only from California but from adjoining States—some from Colorado and possibly from Canada.

The barns as originally planned have been completed, but the entries have so far exceeded expectations that six or eight additional buildings will have to be erected. The exhibits of cattle and hogs will be larger than at the State Fair, and the goat show will be the biggest the world has ever seen. Altogether it will be a real livestock show.

Beet Tops Made Prime Beef

One of the big cattlemen of Southern California has a policy of not keeping a cow over winter if she does not prove with calf. Last year 14 out of a bunch of 60 pure-bred five-year-olds failed to get with calf, so he fattened them on beet tops until they averaged 1595 pounds. Their meat was displayed in Los Angeles windows as prize Christmas beef.

But one word of caution to anyone who may decide to use beet tops. The leaves contain oxalic acid and when fed in large quantities they tend to purge the animals and cause digestive disturbances. Consequently, it is better to feet the beet tops in connection with such dried roughages as hay, corn stover or straw. Or 3 ounces of chalk or ground limestone to every 100 pounds of tops may be used to counteract the effects of the oxalic acid.

Doings of Breed Associations at State Fair

LIVESTOCK SALE DATES.

Sept. 26—W. D. Trewhitt, Hanford, Poland-Chinas.
Oct. 9—Kings County Poland-China Breeders, Hanford.
Oct. 10—W. H. Ginn & Son, Corcoran, Holsteins.
Oct. 17—Second Modesto Sale, Modesto, Holsteins.

Nov. 12—A. W. Morris & Sons, Woodland, Holsteins.
Nov. 21—First Tulare Sale, Tulare, Holsteins.

CATTLEMEN'S ASSOCIATION ACTIVE.

Three different meetings of the California Cattlemen's Association were held at Sacramento during the State Fair.

The first was a get-together of cattlemen from Zone No. 2, covering the Sacramento district. It was addressed by President Nares, and the main subject discussed was the necessity of organization and cooperation. It is probable that a local livestock association of cattlemen in Sacramento, Yolo and Solano counties will soon be formed.

The second meeting was between the cattlemen and the Cattle Protection Board, which has in its hands the enforcement of the "Hide and Brand Bill." Because of the small revenue resulting from inspection fees, it was decided that cattlemen themselves should act as inspectors. Many names of cattlemen willing to act have already been submitted, and the plan will be put in operation as speedily as possible.

The third meeting was of the by-laws committee appointed at the June convention at Davis. The committee approved the form of constitution and by-laws for counties, zone and the central association as submitted to them, and recommended their adoption by the different units.

A call has been issued to all of the local livestock associations throughout the State to convene during October, if possible, to elect delegates to the different zone conventions to be held during the first half of November.

SWINE BREEDERS PLAN IMPORTANT WORK.

State Food Administrator Ralph Merritt expressed a desire that the swine breeders get together for mutual benefit, and at a meeting of the directors of the California Swine Breeders' Association, held during the State Fair, it was decided to launch a movement for a big membership and to start a campaign to put the industry on a more stable basis.

Shortly a definite program of procedure will be announced. One of the first moves will be to secure better marketing conditions, so that the small hog raiser may obtain the full market value of his animals.

Also, the organization is preparing to go before the next Legislature with a proposed law for the inspection of mill feeds. It would be a sort of pure food measure for the livestock man and would require all makers of proprietary feeds to indicate the food value of the contents upon each bag.

A bill intended to accomplish the same purpose was before the last Legislature, but no one was there to push it and it died on the files. This year both the Swine Breeders and the Cattlemen's Association will back it.

JERSEY JINGLES.

Jersey breeders were urged by Judge Peter J. Shields, at their banquet at the State Fair, to give their breed more publicity and put Jerseys "back on the map" again. He told them that they had the best breed, but lacked the animation to keep their breed before the public.

Other rousing speeches were made by Guy H. Miller, Ruland Hardy, Prof. Gordon H. True, Judge F. H. Scribner and J. W. Henderson, Jr.

Eight new members were admitted, and officers were elected as follows: President, Dr. H. W. Hand; vice-president, Guy H. Miller; secretary, J. E. Thorp; treasurer, N. H. Locke; directors, C. G. Marchus, E. E. Greenough, Mrs. Ruth Hardy, S. F. Williams, Dr. Grass.

DUROC-JERSEY DOINGS.

Great enthusiasm was worked up at the banquet and election of officers of the Western Duroc-Jersey Breeders' Association, held during the State Fair. A special drive for members was inaugurated and big things were planned for the coming year.

The following officers were elected: President, F. M. Johnson; vice-president, H. H. Braly; secretary, J. E. Thorp; treasurer, V. F. Dolcini; directors, H. M. Way, Donald Graham, H. P. Slocum.

Meetings will be held at the Los Angeles and San Francisco shows.

POLAND-CHINA PROGRESS.

The annual meeting and election of officers of the California Poland-China Breeders' Association was held during the State Fair and the following were elected: President, W. Bernstein; vice-president, George V. Beckman; secretary and treasurer, A. D. McCarty; directors, Fred Gatewood, H. I. Marsh, M. Bassett, W. A. Young.

Several important matters were brought up and, as many of them are of interest to all swine breeders, they will be covered more fully in a later issue.

BERKSHIRE BRIEFS.

The Berkshire breeders had a jolly good time at their banquet, held during the State Fair. James Mills proved an ideal toastmaster, and entertaining and instructive talks were given by Prof. Thompson and Prof. True of the University Farm, Prof. Wilson of the University of Nevada, Judge Peter J. Shields, J. L. Thatcher, A. B. Humphrey, Frank B. Anderson, J. Francis O'Connor, Chas. Maurer, and Joe Wilson.

SHORTHORNS PRAISED.

John E. Robbins of Horace, Ind., made the Shorthorn breeders happy when he told them at their annual banquet that the animals he judged at the State Fair compared favorably with those he had judged at Eastern shows.

A. W. Foster, president of the association, acted as toastmaster, and other speeches were made by W. S. Guilford, C. R. Thomas, T. T. Miller, T. W. Dibblee, Prof. Gordon H. True, D. J. Stollery, W. Hawkins, and Prof. Wilson of Nevada.

POLAND-CHINAS

September 26th

—at—

HANFORD FAIR GROUNDS

Owing to other business, I am compelled to close out most of my herd of tried

POLAND-CHINA SOWS

I will sell at auction 60 head of tried sows, bred and open gilts. These sows and gilts are from the best herds in the United States, a great many of them are from J. W. Pfander's herd of Clarinda, Iowa, who sold the highest priced Poland-China sow ever sold in America. If you want the best, come or send your bid.

I will also sell my three herd boars—all Eastern bred.

WESTERN MEAT COMPANY

Animal Food Dept. 704 Townsend St., San Francisco

During the past testing year 281 breeders of Holsteins divided $14,712.25 prize money among themselves. This is the amount that the A. R. O. department of the association distributed. Fifteen new 40-pound records were made. There are now thirty-five 40-pound cows.

State Fair Sales

[Written for Pacific Rural Press.]

Alexander & Kellogg of Suisun sold a fine Dairy Shorthorn bull calf to Cox Bros. of Los Banos; also a bull to H. Griepe, Stockton, and a heifer to W. Palmer, Davis.

Highland Stock Farm of Fair Oaks sold for $1,000 the grand champion Chester White boar, Highlander, to Lea Bleakmore of San Francisco, owner of Oak Knoll Farm, Lakeport.

Young & Clark of Lodi sold Poland-China boars to Thos. Purcell, Grand Island; Stevens & Bell, Maxwell; H. H. Windmiller, Elk Grove; American Beet Sugar Co., Chino; J. W. Wakefield, Acampo.

Jack Borge of Los Banos sold a Duroc boar to the American Beet Sugar Co., Chino, and one to Dr. Fred G. Burris, Woodland. He bought three sows and a boar from Dr. Weldon of Sacramento.

E. Miner of Lodi sold a Poland-China boar to Heath Bros. and two sows to S. W. Kidd, both of Ione. Mr. Miner won his first blue ribbon at the Fair this year and was as tickled as a boy with his first pair of boots.

John M. Bernstein of Hanford sold three fine six-months-old pigs, two gilts and a boar, to the Hacienda Chiclin Ranch, Drujillo, Peru, South America. The gilts were daughters of the noted boar, President, and the boar by Model Wonder.

Dixson & Dixson of Hughson took five Duroc gilts and a boar to the Fair and were offered such a good price for them by W. G. Myers of Arbuckle that they sold them to him. Afterwards they bought a corking good boar from J. M. DeVilbiss of Patterson.

J. H. Cook of Paradise, who is going to war, sold his great young boar, Forest View Bob, to C. Roy Marshall of Sebastopol. This massive herd header is by Caldwell's Big Bob, the 1122-pound world's grand champion, and out of a Long King-Big Bone sow.

H. P. Slocum & Son, Willows, sold their junior champion Duroc boar, Uneeda Model Col. 3rd, to D. O. Brant of Elliott-Brant Rancho, Owensmouth, for a long price. This boar was one of the outstanding individuals of the show. The same concern sold a boar to A. M. Bemmerly, Woodland, and their junior yearling sow to G. C. Craig, Owensmouth.

H. I. Marsh of Modesto probably made the banner sale at the Fair, disposing of his prize herd of Poland-Chinas to Fred Hartsook, the noted photographer, whose ranch is at Lankershim. The herd consisted of the famous boar, I B A Wonder, six sows and one gilt. The first prize sow weighed 900 pounds and the second 840 pounds. Mr. Hartsook will have Mr. Marsh show this grand herd at Los Angeles and San Francisco.

HANDLING THE HERD BULL.

(Continued from page 311.)

Don't try to stop him. That is merely an indication of vitality—the very thing you want.

If you have two bulls and they are dehorned (they certainly ought to be), keep them in the same pen. All animals like company, and dehorned bulls running together play enough to get the needed exercise, yet never hurt each other. At the start they will fight it out to see which one is the boss, but after that they will live together in peace.

VICIOUSNESS NO DETRIMENT.

If you have a bull that is vicious or ill-tempered, don't think of getting rid of him on this account alone. The most prepotent and therefore the most valuable bulls that have ever been known to the dairy world have been more or less vicious. The same nervous force which makes a bull ferocious also counts for production. So have an equipment that will enable you to handle him with safety, but keep the vicious bull. Get rid of his opposite—the sluggish, inactive one.

Don't make a pet of any bull. Never trust the most gentle one. Be on your guard at all times, and handle bulls as though they were vicious, for no bull ever lived a natural lifetime without having vicious moments. Don't allow a gentle bull to make necessary the services of the doctor or undertaker. It is better to be a live dairyman of judgment than a dead one of conceit.

SAN FRANCISCO SHOW AN EYE-OPENER.

"This exhibition will open the door to new possibilities in livestock production and development on the Coast," says Joseph E. Painter, the genial manager of this great enterprise. "Exhibitors are making heavy entries, realizing that the thousands of persons who will pass through its gates will afford a wonderful means of advertising their animals and attracting buyers." And we might add—just as good a means for those who are in the market for stock to find the best to be had.

The show promises to be a hummer. There will be classes, not only for breeding herds, but carloads of fat and feeder cattle and swine; classes for single steers in purebreds, grades and cross breeds. There will be a carcass contest and many other interesting features. Don't forget the dates—November 2 to 10.

Breeders intending to exhibit should bear in mind that entries close October 5. Don't wait until the last minute. Send in your entries now.

Purebred Registered
HOLSTEIN CATTLE

Are you paying for the privilege of milking your cows or do they actually make good? The Department of Agriculture estimates that the average cow yields 155 lbs. of butterfat per year, while it takes 170 lbs. just to pay expenses.

Some dairymen are making a big success, so many must be running at a loss. If you have any of these average cows, get rid of them and get some profitable ones.

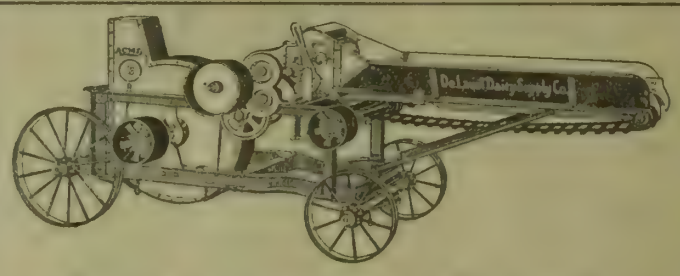
FOR SILO FILLING
AND
FEED CUTTING



The ACME Cutter

THE SPIRAL KNIVES CUT CLEAN
THE STEEL FRAME MEANS DURABILITY

INSURE a well packed, evenly cut silage by filling the silo yourself. The Acme Silo Filler will pay for itself in one season, by chopping your dry feed and making alfalfa meal.

Feeding hay in bulk is wasteful—chopped feed is all eaten. Don't lose $3 to $5 worth of hay out of every ton you feed. Chop it with an Acme Cutter.

A Size for Every Dairy. *Catalog on Request*

VETERINARY BOOKS NOT FREE.

Some time ago it was announced in this Journal that books on diseases of horses and diseases of cattle might be obtained on application to the Bureau of Animal Industry, United States Department of Agriculture. A recent communication from this bureau conveys the information that these books were issued as congressional publications and allotted to Senators and Representatives for distribution. The department received no allotment. The books may be purchased from the Superintendent of Documents, Government Printing Office, Washington, D. C., at $1 each.

LIVESTOCK DIRECTORY.

Holsteins

MODESTO, CALIFORNIA
Thursday, Oct. 17, 1918

Including the largest number of high record cows, high record bulls, sons and daughters of high record sires and dams, bred to the highest record sires, ever sold at public sale in the San Joaquin Valley. Among them:

A BEAUTIFUL 27-89-POUND COW, in calf to a 29-pound son of Prince Gelsche Walker.

A 26.90-POUND JUNIOR FOUR-YEAR-OLD DAUGHTER of Gordon Glen Pontiac. She is due to freshen October 20 to King Segis Alcartra Abbekerk, 30-pound son of the $50,000 bull.

A 23-POUND FOUR-YEAR-OLD, bred to a 29-pound son of Sir Chimacum Wayne, and she is a beauty.

A 21.90-POUND THREE-YEAR-OLD DAUGHTER of Spring Farm King Pontiac, bred to the twice grand champion bull, King Segis Alcartra Prilly, and due to freshen on November 7.

AN 18.51-POUND JUNIOR TWO-YEAR-OLD DAUGHTER of King Segis Pontiac, bred to King Segis Alcartra Prilly.

A DAUGHTER OF KING KORNDYKE SADIE VALE, out of a good record dam, and bred to King Segis Alcartra Abbekerk.

A DAUGHTER OF PRINCE GELSCHE WALKER, and she made 577 pounds butter in one year at two years two months. She will be fresh by sale time.

A 20-POUND COW that made 644.09 pounds butter in 320 days, and she is heavy with calf to Prince Alcartra Korndyke, son of Tilly Alcartra.

AN 18.21-POUND JUNIOR THREE-YEAR-OLD DAUGHTER of a 30-pound cow and a 37-pound sire, heavy with calf to the twice grand champion, King Segis Alcartra Prilly.

A 20.98-POUND SENIOR THREE-YEAR-OLD, due to freshen in November to King Segis Alcartra Abbekerk.

A GREAT COW that made 25.01 pounds butter in seven days as a senior four-year-old and at mature age made 18,362.3 pounds milk and 814.23 pounds butter in one year. She is fresh and milking heavy right now.

A 17-POUND JUNIOR TWO-YEAR-OLD, due to freshen November 8 to King Segis Alcartra Prilly.

AND DON'T FORGET THE BULLS.

There will be several real herd headers in the sale, including a 30-pound bull, two 29-pound bulls, and others with high record backing, both short and long time records.

Poultry for Profit

By Susan Swaysgood, Pomona.

LET ALL HELP TO RELIEVE THE POULTRY FAMINE.

The Pacific Coast is already beginning to face the shortage in table poultry that I have been telling you about lately. Prices on all kinds of poultry went up two cents a pound last week, and that just at a time when the market is supposed to be glutted with hens of light weight that have been thrown out as non-producers, or the molting hens. Heavy colored hens at 29c a pound—does not that price suggest to every farmer or rural resident a means of turning grass and a little grain into money?

THE HEN A VITAL NATIONAL QUESTION.

The question of raising chickens, ducks and rabbits, if only to supply your own wants and that of one other family not so favorably situated, ought to appeal to all of our readers, because it is of vital interest to the nation. Better put your thinking cap on, Mr. Farmer, and see where a good flock of hens would come in to rustle some of the waste on the farm into good chicken meat—chickens, bees and fruit, with a little patch of alfalfa on the side for dessert for both bees and chickens. What if you do have to buy a few sacks of grain, if you keep good hens they will put it to good use and return the money with interest.

The man who puts all his eggs in one basket may carry the load a little easier when everything is in his favor, but if an accident happens to the basket where is he? If he has ever so little in another basket, it relieves him that much.

CHICKENS RELIEVE A LOW EXCHEQUER.

This is not all surmise, folks—I've been there. Sonoma county never was known to have a failure of crops, but there have been odd years when the prune crop has been so light through late rains or frosts that if it had not been for my poultry I could not have paid the interest on the mortgage and pay other debts, to say nothing of living. It was up to the poultry to do the trick, and they did it under much less favorable prices than we have now.

Whenever I felt my exchequer getting low, the first thought was to get in and raise some chickens, and they always paid my expenses and gave me a good margin of profit. As a get-rich-quick business there are lots of things better than poultry farming, but as a reliable source of increase to the general fund there is nothing to beat it.

If you have not a flock already, this is a good time of year to start in with either a few hens or a hundred little chicks. By starting in with hens you can learn much from them during the winter, and if you already have some knowledge of chicks you can start in very cheaply by getting baby chicks from one of the hatcheries advertised in the Rural Press, who are reliable. Business men of today must advertise all the time to inspire confidence in themselves and their wares; those that don't do it lose out.

SEPTEMBER SUGGESTIONS.

This is the month of changes, when cool and perhaps damp nights are more contrasted with hot, sultry days, so that unless poultry is given care we may call September the trouble-making month. Colds are more easily taken by hens that have been laying heavily all summer and are a little out of condition, perhaps owing to the molt, and colds neglected soon progress into roup. So that this month extra care should be exercised to prevent colds. See that the roof is good and waterproof. Nothing causes colds more quickly than a leaky roof. See that there are no cracks around the perches; if a draught strikes a chicken on the head, it has to be a strong, well-conditioned fowl to resist taking cold. A draught under or over the roosting place does not cause much trouble, but when it is directly on them look out. Another thing that is dangerous is a mixed fence. So many ranches have a picket fence between field or orchard that one is tempted to use one side as a fence in yarding the farm poultry; but it does not pay. These nice mornings the hens seek the sunny picket fence and a cool wind, amounting to a draught, strikes them on the head. Next thing we notice sneezing, and closer inspection shows that the eyes are watery. If these things are noticed quickly enough, the cold can be nipped before it develops into roup. A good physic is the quickest way to cure incipient colds—about four or five ounces of castor oil to one hundred hens is perhaps the best remedy. Serve in moist mash just before they go to roost. It is best to dissolve the oil in the right amount of warm water to mix the mash, then the oil will be more evenly distributed. See that all the fowls get some of the mash, and if any is left pick it up and serve, with more mash mixed with it, for breakfast.

Coal oil can be used if nothing else is available—about a pint to one hundred hens, mixed with warm water. A little tonic may be given to good advantage after the oil, such as a tablespoonful of powdered sulphate of iron to each dozen hens in either dry or moist mash for a week or two. This increases the appetite and helps build up the resisting powers.

PTOMAINE POISONING.

To the Editor: My six-months-old pullets have been dying. They are fine and healthy, and suddenly are taken with a weakness in the legs and cannot walk at all. Then they begin to shiver and tremble. They live about four days and only drink large quantities of water till they die.—J. W., Brentwood.

[Your pullets are getting some sort of poisonous meat, gopher, squirrel, mice, or maybe dead chickens; but it is something that is producing ptomaine poison. Look around and clean up all outlying premises. Medicine is very little use when far gone, but if you find out early give each fowl ten drops of tincture of nux vomica in a little warm water, then keep water before them with ten drops of the tincture to a quart of water. Continue this until they recover.]

Repeating Shotguns and Rifles

for Shooting Right

WHETHER .22 repeater for the boy or autoloading shotgun for yourself, a high power autoloading rifle for that well earned deer hunt or a pump gun or rifle for general use, buy a Remington UMC and know you are getting the *right* arm.

Every Remington UMC shotgun or rifle is *right* in every mechanical detail—hammerless, with solid breech, has positive safety lock and either autoloading or slide action. And *right* in shooting qualities, balance, fit, material, workmanship, finish and appearance.

Buy Remington UMC Shotshells or Metallic Cartridges and add the *right* finishing touch. For example, for squirrels, woodchucks and other small animals, the Remington UMC .22 cartridge with hollow point bullet gives best results.

The wonderful Wetproof process used exclusively in the manufacture of Remington UMC Smokeless "Arrow" and "Nitro Club" Shotshells, produces a shell which can be exposed to wet for hours without harm.

In *black powder* shotshells, buy the old reliable Remington UMC "New Club," now wetproof sealed at turnover (crimp) and top wad.

"MY WAGE."

"I bargained with Life for a penny,
And Life would pay no more,
However I begged at evening
When I counted my scanty store;

"For Life is a just employer,
He gives you what you ask,
But once you have set the wages,
Why, you must bear the task.

"I worked for a menial's hire,
Only to learn, dismayed,
That any wage I had asked of Life,
Life would have paid."

—Jessie B. Rittenhouse.

THE TIME WHEN TOPSY STAYED.

Little Myrtle was having a hard time, she thought. Anyway she wasn't happy, for who could be "feeling nice," she said to her mother, "when folks had to stay in the house just because it was all wetty outdoors and the wind was a-blowing."

And mother answered, "Why, dear, you've got so many nice dolls and other playthings—I should think that any child with all that you have could be happy."

"Well, I can't," pouted Myrtle. "If only Dorothy would come, or I wasn't so tired of everything, I might."

"There's Topsy," said mother, looking out of the window, "she's bringing back the waists that her mother has been laundering. Go to the door, dear, and tell her to come in and get warm."

"Topsy," said mother, as the little black girl was standing before the fire, "do you think you could be happy to have to stay in this room for one afternoon, and play with eleven dolls, a doll bed, a buggy, dishes and ever so many other toys?"

Topsy showed her white teeth. "Yes'm, I'd like it mighty well," she laughed.

"But you'd get so tired you wouldn't know what to do next," said Myrtle.

"I could make a big, big house with those blocks, and put a nice big chimney (she called it chimbley) in it with my spools."

"Oh, could you?" cried Myrtle, delightedly. "Well, I'll get some spools—a whole lot of them—and you shall show me how to make an old-fashioned chimney."

Myrtle's mother smiled her assent, so they set to work. They made the house on a plan that Myrtle had never thought of, then Topsy showed her how she had made the chimney in her house, although her blocks were those she got from the men who were building across the street.

When they had the chimney up, Topsy laid some toothpicks on the hearth, then she set the doll's cradle near, "to keep warm,' 'she said.

They set the toy piano across one corner; then Topsy thought of something else nice, and, with much laughter, they made a lady of spools to sit on the piano stool, because, as Topsy said, the spool-lady would sit up straight and the doll-lady would fall off.

They set out the table, and got out the dishes; then Topsy spied a piece of old linen from which Myrtle's mother was cutting some dish towels, and she said to Myrtle, "If your mother will let us have the colored border, we'll cut out the birds in it and make something pretty."

Of course mother was glad to let them have the pieces; then she gave each of the little girls a pair of scissors, and they set to work to cut out small, round pieces—each piece had a red bird in it. These were used as doilies to put under plates and saucers. They nearly covered the whole table with these doilies, and even placed some on the dresser in the doll's bedroom, and finally they made a scarf for the little rocking-chair, pulling out threads to make a fringe.

"Mother, mother, just look! I never did have such a pretty house before," cried Myrtle, gleefully.

"I think you'll have to thank Topsy for giving you some new ideas," laughed mother; "but now it is dark almost, and I shall have to send Topsy home as soon as I can get a piece of cake and an apple for her."

"And I'll give her one of my dolls," said Myrtle, generously.

After Topsy was gone, Myrtle said, "Why, mother, I could have had a good time before if I'd just have made myself do things whether I wanted to or not."—Mary S. Hatch.

FRUITS IN SEASON.

Educate the family to demand fruit acids as an accompaniment of meat. Fruit is food; serve it well and better health will repay your good cooking.

With bacon, serve apples baked without sugar, or cut the apples from the core without peeling, place in a deep pan with a very light sprinkle of sugar and half a cup of water. Cover and steam until tender, remove cover, brush top with syrup and brown in hot oven. Serve hot.

Ripe peaches or pears steamed until just tender through make an appetizing sauce for meats. Peel, but do not cut. Cook in a saucepan, tightly covered, with just enough water to prevent burning. Allow one tablespoon of sugar to a dozen peaches or pears. Be careful not to overcook.

Blue plums prepared in the same way are especially good with chicken. Peaches or apples quartered and cooked clear in a thin syrup with a bit of lemon make a delicious accompaniment for chicken. Serve rice with this combination.

FRUIT BUTTER.

Fruit butters can be made without sugar. Add one quart of apple syrup or grape syrup to one quart of fruit pulp. Boil down to a thick buttery consistency and seal hot. This is a tart butter and an excellent relish. If a sweet butter is wanted, add sugar, sorghum or molasses when these are available, reheat and seal.

NEW RULING ON FLOUR.

Housewives will be interested to learn that a new ruling on the amount of white flour that may be purchased has gone into effect. Hereafter you may purchase four pounds of white flour for each pound of substitute flours.

CIDER JELLY.

Sweet cider jelly can be made without sugar. Boil apple syrup until the jelling point is reached. This jelly makes an excellent relish with meat.

Willie came to his mother with an expression of anxiety on his face. "Mother," he asked, "if a poor, hungry little boy was to come to the back door and ask for something to eat, would you give him that piece of pie that was left over from dinner?"

"Yes, Willie, of course I would," said the mother.

Willie's face cleared.

"All right," he said, "just wait a minute till I run to the back door."—The Continent.

Agricultural Summary

The New Almond Crop Prices.

At a meeting of the representatives of the California Almond Growers' Exchange, the following opening prices were authorized: Nonpareil, 25½c; I X L, 24c; Ne Plus, 22c; Drakes, 18c. These prices are to the trade, from which cash discount and expenses must be deducted. They are merely the best guess as to the market on the day they were fixed. They may later be lowered or advanced, as conditions require. Trade papers will quote higher prices, as the Exchange is trying to advance the market. At the end of each season a certain number of members complain that they have not received the prices as to the trade. From this price the cost of selling, warehouse expense, brokerage and cash discount have to be deducted. The Exchange will advance to members before it receives a dollar from sales approximately one-half a million dollars. The first advance has gone out promptly, which is: Nonpareil, 15c; I X L, 14c; Ne Plus, 13c; Drakes, 12c. Further advances will be made as fast as sales warrant. We understand that somewhat higher prices will be obtained by the association than those published.

Storage Butter, Eggs, Cheese.

The figures below are compiled from incomplete returns received by the Bureau of Estimates, Department of Agriculture, to requests sent out to the various storage plants of the United States for information. They are sufficiently full for purposes of comparison:

Commodity—	Holdings Sept. 1, 1917 (Pounds)	Holdings Sept. 1, 1918 (Pounds)
Creamery butter ...	107,776,392	100,503,488
Process butter	3,180,789	4,396,902
American cheese....	91,545,232	54,184,739
Case eggs	*6,369,312	*6,202,239
Frozen eggs	19,631,413	19,668,992
Swiss cheese	663,912	775,712
Brick & Munster Ch.	416,988	455,922
Limberger cheese ..	414,007	439,923
Cottage cheese, etc..	1,338,726	1,422,928
Cream and Neufchatel cheese	65,685	87,544
Other cheese	711,700	4,008,787

*Cases.

The 1919 Wheat Price Explained.

The price of $2.20 a bushel, minimum, guaranteed by the Government for the 1919 wheat crop is based upon No. 1 hard white wheat delivered at the terminal station. On other grades the price is lower. In the intermountain country, which applies to Nevada and Arizona, a minimum guarantee of $2 per bushel is made for the No. 1 grade f. o. b. loading station. In other words, if the freight rate from the f. o. b. shipping point to the nearest terminal exceeds 20c per bushel, the $2 minimum is effective.

The Apricot Market Dilemma.

It appears that heretofore about 70 per cent of California's apricot crop has been sold abroad, leaving 30 per cent for home consumption. The war has practically suspended the export of this fruit, throwing about three times the normal volume on the home market. Furthermore, apricots require more sugar than most fruits, and sugar is shy and purse proud. It looks as though the apricot grower is up against it until a restoration of normal export conditions is brought about.

Heavy Cut on Citrus Shipments.

The total shipments of oranges, lemons and grapefruit from California for the year ended August 31 aggregated 25,233 cars, or 42 per cent only of the previous year's shipments. The sum of $47,311,818 was received by the growers for their fruit. The short crop was due to the extremely torrid weather of June last year and the consequent heavy drop.

Tomatoes $20 Per Ton.

Healdsburg tomato growers, with a heavy crop, are to receive $20 per ton from the California Packing Corporation, regardless of their previous contracts. It will be remembered that at the beginning of the season a semi-governmental contract price of $15 was offered and accepted by many growers.

THE MARKET REPORTS

Figures Given are Independent and Reliable.
Prices Quoted as Paid to Producers.

SAN FRANCISCO

San Francisco, Sept. 18, 1918.

WHEAT.

Wheat is selling at the prices announced by the Federal Grain Corporation, and these prices will doubtless be maintained for the present crop. The prices quoted are for grain f. o. b. San Francisco, Los Angeles, Seattle, Tacoma and Portland, and guaranteed at least $2 per bushel f. o. b. shipping point. The price of sacks and sacking not included.

No. 1 hard....................$2.20
No. 2 .... 2.17
No. 3 .... 2.13
No. 1 soft.................... 2.18
No. 2 .... 2.15
No. 3 .... 2.11
Club or Sonora, No. 1.............. 2.16
do, No. 2.................... 2.13
do, No. 2.................... 2.09

BARLEY.

With the sale of barley to brewers prohibited, the market is stagnant and it is said that bankers are beginning to call barley crop loans. This, with the fact that barley must soon be moved out of storage to make room for the coming crop, has created a condition which may occasion serious loss.

Choice feed, per ctl............$2.40@2.47½

OATS.

The oats market is slightly stronger, but it is still inactive. There has been some inquiry for seed oats.

Red feed, per ctl..............$2.50@2.65
Red seed .... 3.00@3.25

CORN.

There is practically no demand for corn, but the limited stock on hand is strongly held.

(First-hand prices on strictly first-class grain, San Francisco.)

California sacked ....$4.20@4.25
Milo maize .... 3.95@4.05
Egyptian .... 4.05@4.10

HAY.

Receipts of hay for the past week were 1331 tons, compared with 1611 the previous week. These receipts are light for the season of the year, but the market has been dull and inactive. The recent heavy rains, which are extraordinary for this time of the year, will no doubt have a decided bearing upon the hay market of the future. There is a great deal of alfalfa hay yet on the rivers as well as in the interior districts, and as Central California had abnormal rainfall a great deal of this hay is sure to be materially damaged and will no doubt be shipped to this market to be disposed of. This market is in no condition to receive damaged hay, which must be used immediately, and it would be well for shippers to consult with their consignee before shipping this hay.

Wheat No. 1 ....$23.00@25.00
do, No. 2 .... 20.00@22.00
Choice tame oat.................. 24.00@26.00

Barley straw ....50@80c

FEEDSTUFFS.

The rains have had no effect upon the feedstuff market as yet, but early grass will have its effect. Rolled barley was somewhat weaker.

New alfalfa meal, per ton......$33.00@34.00
Coconut cake or meal.......... 45.50
Cracked corn .... 86.00@88.00
Oilcake 78.00
Rolled barley .... 51.00@52.00
Rolled oats .... 58.00@60.00
Bran, carload lots in S. F.... 23.75
Mixed feed, do, do.......... 25.00
Middlings, do, do.......... 25.75

POTATOES, ONIONS, ETC.

The heavy rains have had a marked effect on the vegetable market, and many green vegetables are temporarily off the local market. Potatoes were depressed 10 or 15 cents, but recovered. Onions were dull at unchanged prices. Peas and beans are off the market and none are expected for several days. Tomatoes were damaged, but are again on the market. Green corn is of poor quality and difficult to sell at the lower quotations.

Peas ....None
String beans ....None
Wax beans, per lb..........................None

BUTTER.

Butter has shown a steady advance in price throughout the week, closing at the top. This advance is said to be legitimate, brought about by the falling off in receipts. Even at 59½c, butter in San Francisco is said to be cheaper than in any of the large Eastern centers. The U. S. Food Administration has notified butter dealers that after September 15 no licensee shall manufacture and sell units of butter in print form that weigh less than one pound. This does not apply to retailers and does not prevent manufacturers disposing of their stock, already manufactured, up to January 1st next.

EGGS.

Eggs slumped off 3½c for extras and 6c for pullets from the quotations of a week ago. The cause is a mystery to dealers. Receipts were normal during the week and the only explanation suggested is that short-term storage eggs, less than 30 days, may now be sold as fresh, according to a recent decision of the Federal Food Administration. There is a disinclination on the part of consumers to pay the high prices asked.

CHEESE.

Fancy Oregon triplets again took the leadership of the cheese market, advancing to 31½c. With the exception of California Y. A. fancy, all descriptions of California were weak. There was no demand for the cold storage Oregon cheese. Monterey cheese is selling at a higher figure.

FRESH FRUITS.

The fruit market was seriously affected by the rains and for several days there were few arrivals. Berries were damaged, but they are again on the market. Peaches are coming in in larger quantities than ever, but the stock is green and unattractive. Grapes are the dominant fruit on the market at present.

CITRUS FRUITS.

There are few oranges on the market, and the best were advanced to $8.50. Lemons are plentiful and sell on a narrower range of price. Lemonettes and grapefruit are unchanged.

DRIED FRUITS.

The rains of last week did serious damage to the prune crop in Santa Clara Valley. Black figs in the northern part of the State were practically wiped out. The white figs in the northern part and about Modesto were badly damaged, but most of this description comes from the Fresno district and were not damaged.

Special Deciduous Market Report

By J. L. Nagle.

Sacramento, Sept. 16, 1918.

All markets showed a decided improvement this past week over the week previous. This was due to a large extent to lighter receipts, though the offerings were about as heavy as the previous week, on account of the great number of cars that had been parked at terminals.

Overripe pears that had flooded the New York market from the Northwest and certain points in California have about been disposed of, and good, firm stock met with a ready sale.

There is a decided improvement in the grape market, the market advancing on good quality Tokays and Malagas, and indications are that on account of the light receipts now in transit there will be a noticeable advance this coming week.

Few peaches and plums are appearing on the market.

The heavy rain in the upper San Joaquin and Sacramento valleys during the past few days has unquestionably damaged the Tokay crop at least 50 per cent. It will also have the effect of forcing discontinued shipments of wine grapes, which to a large extent had not been previously arriving in good condition. Fortunately the rain did no damage to the Malagas or Emperors or any other fruits in the Fresno district.

Scarcely better than 20 per cent of the Tokay crop had been marketed, and, though favorable weather conditions may dry out a certain percentage of the grapes, this will depend largely upon the condition of the bunches, and shippers may find it to their advantage to ship in lug boxes, which style of package will be safer under the circumstances.

Practically 75 to 80 per cent of the Malaga crop has been marketed and the Emperor season will open this coming week. On account of the scarcity of grape packing material, such as redwood sawdust, the shippers will be compelled to pack from 40 to 50 per cent of the Emperors in lug boxes.

Averages for the week:

New York: Pears—Bartlett, $2.60; B. Hardy, $1.87; B. Clairgeau, $2.80; B. Bosc, $2.73. Grapes — Tokay, $1.95; Malaga, $1.45; Alicante Bouchet, $1.68; Muscat, $1.37. Plums—Grand Duke, $1.75; Giant, $1.28; Gros, $1.66. Peaches—Georges Late, $1.85; Albright Cling, $1.20; McDevitt, $1.42; Phillip, $1.50; Elberta, 87c; Lovell, $1.05; Orange Cling, $1.55; Lemon Cling, $1.45.

Boston: Peaches—Salway, $1.30; Orange Cling, $1.15; Lemon Cling, $1.22; Strawberry Cling, $1.32; Hulls Late, $1.12; Picquettes, $1.22; Phillips, $1.43. Pears—Bartlett, $2.98; B. Clairgeau, $4.00; B. Hardy, $2.88. Grapes—Tokay, $1.85; Malaga, $1.46; Muscat, $1.15; Cornichon, $2.12. Plums—Giant, $1.05; Gros, $1.47; Kelsey, $1.57; Hungarian, $1.43.

Chicago: Peaches—Lovell, 93c; Picquettes, $1.09; Salways, $1.21; Phillips, $1.33; Levi, $1.32; Yellow Free, $1.25; Elberta, 98c. Plums—Kelsey, $1.78; Giant, $1.54. Grapes—Malaga, $1.63; Tokay, $1.98; Rose Peru, $1.10; Muscat, $1.24; Cornichon, $1.70. Pears—Bartlett, $3.42; B. Hardy, $2.52; B. Clairgeau, $2.50.

Total shipments, from September 7 to 12, inclusive: 53 peaches, 88 pears, 1157 grapes. Total to date, 1918, 14,225 cars. Total to date, 1917, 12,971 cars.

Special Citrus Market Report

San Francisco, Sept. 17, 1918.

The residue of Valencias now on hand has become so reduced that the offerings on the various markets are very light and are promptly bought up even at the high asking prices. Fancy fruit is selling in New York at from $9 to $10.80 and on board at shipping points at $7.50 to $7.75. The condition of the approaching crop of navels is very promising, according to late reports, except in the San Joaquin districts, where there is a slight setback.

The lemon market continues weak. It is said that pickings latterly have been very heavy and that some belated steamers laden with foreign lemons have been unloading heavy consignments in the New York harbor. It is estimated that the output of California's lemon growers are now adequate to supply the requirements of all domestic markets. Eastern quotations: $2.35@3.80. St. Louis offered a low market of $1.75@2.55.

Total shipments of oranges for this season up to the close of last week were 16,296 boxes; last season, 43,815 boxes. Total shipments of lemons for same period, 5525 boxes; last season, 7549 boxes.

LOS ANGELES

Los Angeles, Sept. 17, 1918.

BUTTER.

The markets are again higher in the Central West and East, advancing the past week there 3@5c on extras. This had a sympathetic influence upon the market here and caused extras to advance 2c on Saturday and the market has remained firm at this improvement since.

We quote:

California extra creamery	53c
do, prime first	51c
do, first	50c

Daily quotations—

Extra	51	51	51	51	53	53
1917—						
Extra	41	41	41	41	44	44

EGGS.

The market has lost that snap that has characterized it heretofore. The prices of fresh ranch eggs have gotten so high that consumers are taking hold of cold storage more willingly. Yet under the influence of the light receipts last week's prices were sustained. The receipts by rail for the week were 425 cases, against 396 cases the same week last year. The receipts by truck continue to run about four times as heavy as the arrivals by rail, making the supply for the week 2125 cases, against 1980 cases the same week last year.

1918—	Tu.	Wed.	Thu.	Fri.	Sat.	Mon.
Extra	59	59	59	59	59	59

1917—						
Extra	44½	46½	46½	48	48	48
Case count	42	44	44	47	47	47
Pullets	37	39	39	40	40	40

POULTRY.

Receipts continue light and under a little better demand for most offerings the market ruled stronger the past week. Turkeys are also a little higher, but ducks and geese are unchanged and the demand for them light.

The following prices were agreed upon last Friday, September 13, and hold good until the coming Friday:

Broilers, 1@1¼ lbs	35c
Broilers, 1½@1¾ lbs	35c
Fryers, 2@3 lbs	31c
Roasters (soft bone), 3 lbs. and up	31c
Stags and old roosters, lb	20c
Hens	24@31c
Tom turkeys	32@35c
Ducks	22@28c
Geese	15c

VEGETABLES.

Bell peppers were dull and lower, also cabbage. Potatoes were a little firmer. Onions were steady but slow sale. String beans and lima beans and summer squash and cucumbers and tomatoes were all unchanged and demand fair.

We quote from growers:

Potatoes, local per lug	75c@$1.00
do, do, per cwt.	$2.00@2.25
do, northern, per cwt.	2.50@2.75
Sweet potatoes, per lb.	2½@3c
Garlic, per lb.	8@9c
Onions—Stockton Yellow Danvers, cwt.	$1.75@2.00
Onions, White Globe, per cwt.	2.00@2.25
Onions, Small Bermuda, per crate	80@90c
Cabbage, per 100 lbs	$2.00@2.25
Bell peppers, per lb	2½@3c

FRUITS.

There is a good demand for all fancy offerings, but poor stock was hard to move. The market was well supplied with grapes of excellent quality, which sold at steady prices. Peaches and pears also continue in very good demand. Plums steady and selling well. Apples coming in more freely; slow sale and lower.

We quote from growers:

Figs, Black Spanish, 7-lb. box	35@50c
do, White, 7-lb. box	30@50c
Peaches, freestone, per lug	$1.00@1.25
do, clings, per lug	1.25@1.50
Pears, local, per lb	2@3c
Pears, Mountain	3½@4c
Plums—Satsuma, per lb	4@4½c
Nectarines, per lb	4@5c
Grapes—	
Malagas, per lb	2½@3c
do, Muscat, per lb	2@2½c
do, Liberty, per lb	2½@3c
do, Rose Peru, per lb	2½@3c
do, Tokay, per lb.	4@4½c
do, Cornichon	4@4½c
Apples, Bellefleur, 4-tier	$1.65@1.75
do, 3½-tier	1.70@1.80
do, Gravenstein, 4-tier	2.25
do, do, 4½-tier	2.00
do, Bellefleurs, local, per lb	2@2½c
Avocado pears, small, per doz	50c@$2.00
do, large, per doz	$4.00@5.00
Plums, per lb	5@6c

BERRIES.

There were more strawberries in the past week and the market was slow. Too much other fruit in for the good of the berry market. Blackberries and raspberries were in light supply.

We quote from growers:

Strawberries—	
Fancy, per 30-basket crate	$2.25@2.50
Poor to choice, 30-basket crate	1.60@1.80
Blackberries, 30-basket crate	2.50@3.00
Raspberries, 30-basket crate	2.75@3.00

MELONS.

Receipts of cantaloupes continue to fall off and the tone of the market the past week was stronger and the demand very good for all good stock. Not so many Honeydew melons in.

Cantaloupes—	
Tip Top, home-grown standard crate	$1.15@1.25
do, do, pony crate	70@80c
do, do, jumbo crate	$2.50@2.75
Columbia, jumbo crate	2.75@3.00
Paul Rose, standard crate	$1.25
Casabas, per lb	1½@2c
Pineapple, standard crate	$1.15@1.25
Watermelons, per 100 lbs	1.00@1.25
Honeydew melons, 16-inch crate	1.00@1.10
do, jumbo crate	3.25@3.50

BEANS.

The new crop has begun to move and there was a little more doing the past week. Buyers, however, are refusing to bid prices up, though the tone of the market was firmer. Limas and the whites were in most request. Quotations unchanged.

HAY.

There was a dropping off in the receipts the past week and the market, under lighter arrivals, held steady. The dairy people took what little alfalfa is coming in, but there was little or no demand for horse hay.

We quote f. o. b. Los Angeles—

Barley hay, per ton	$24.00@26.00
Oat hay, per ton	26.00@28.00
Alfalfa, northern, per ton	21.00@22.00
Alfalfa, local, per ton	22.00@24.00
Straw, per ton	9.00@10.00

Special Livestock Market Report

San Francisco, Sept. 18, 1918.

CATTLE—The shortage of good beef cattle is still a feature of the market, and all classes are firmly held. Good cow stuff is stronger than last week and there is a noticeable improvement in good steers. The rise in prices noted in our quotations is doubtless influenced by the higher prices prevailing at the Eastern and Northern markets. Prime beef cattle are quoted in the Chicago market today at $16.50@19.50.

Grass steers—	
No. 1, weighing 1000 to 1200 lbs.	11½@12c
No. 1, weighing 1200 to 1400 lbs.	11½@11¾c
Second quality	10@10½c
Thin	8@9c
Cows and heifers—	
No. 1	7½@8c
Second quality	6½@7c
Common to thin	4@5c
Bulls and stags—	
Good	6@7c
Fair	5@6c
Thin	4@5c
Calves—	
Lightweight	11c
Medium	10c
Heavy	8½c

SHEEP—While there is little change in the sheep situation, prices are strongly held. Lambs are coming in more freely.

Lambs—	
Yearlings	12@12½c
Milk	14@14½c
Sheep—	
Wethers	11½@12c
Ewes	9@9½c

HOGS—The hogs now coming in are much better in quality and they are coming in in increasing numbers. The quotations below are the highest ever recorded in the history of the San Francisco market. On the Chicago market yesterday good to choice hogs sold from $19.00 to $19.50.

Hogs—	
Hard, grain-fed, 100@140	18c
do, do, 140@300	18½c
do, do, 300@400	18c

Los Angeles, Sept. 17, 1918.

CATTLE—There was a better tone to this market the past week. But few choice fed steers being offered and they were in good demand and firm, in sympathy with strong markets East. Thin and medium stuff is still plentiful.

Per cwt. f. o. b. Los Angeles—

Beef steers, 1000 to 1100 lbs.	$9.00@12.00
Prime cows and heifers	7.50@ 8.50
Good cows and heifers	7.00@ 7.50
Canners, per cwt.	5.00@ 5.50
Calves, per cwt.	8.50@ 9.50

HOGS—A firm market and fair demand for what hogs are coming in. Continued high markets in the Central West having a sympathetic influence upon the market here.

Per cwt. f. o. b. Los Angeles:

Heavy, averaging 275@300 lbs.	$15.50@16.50
Mixed, 225@275 lbs.	16.00@17.00
Light, 175@220 lbs.	16.50@18.00

Rough docked 20 pounds, piggy sows 40 pounds and stags 40 per cent.

SHEEP—The past week was quiet. Not many wanted, but as the receipts were light, killers paid steady prices for what they got. California and Arizona furnished most of the supply.

Per cwt. f. o. b. Los Angeles—

Prime wethers	$9.00@10.00
Prime ewes	8.50@ 9.50
Yearlings	9.50@10.50
Lambs	15.00@16.00

North Portland, Sept. 16, 1918.

Offerings for the opening day totaled approximately 1300 head of cattle, running from the fair to medium handy grades up to the choice heavy grades. Prices are generally well maintained. Quotations are: Prime steers, $12.00@13.00; good to choice steers, $11.00@12.00; medium to good steers, $9.75@11.00; fair to medium steers, $8.25@9.25; common to fair steers, $6.00@8.25; choice cows and heifers, $8.00@9.00; medium to good cows and heifers, $6.00@$7.25; fair to medium cows and heifers, $5.00@6.00; canners, $3.00@4.00; bulls, $5.00@8.00; calves, $9.00@12.00; stockers and feeders, $6.00@8.00.

Seven hundred hogs counted into the hog division over Sunday. Buyers were bearish, but with a light run the sellers were able to hold prices steady. Prime mixed, $19.50@19.75; medium mixed, $19.00@19.35; rough heavies, $18.00@18.35; pigs, $16.00@17.00; bulk, $19.35@19.50.

With 1900 head of sheep and lambs counted into the sheep alleys over Sunday, prices are held steady with last week's close. Quotations follow: Prime lambs, $13.50@14.50; fair to medium lambs, $11.00@12.00; yearlings, $10.00@11.00; wethers, $9.00@10.00; ewes, $6.50@8.50.

UNCLE SAM SAYS:

On October 2 all subscriptions that are six months or more in arrears must be stopped.

He doesn't mean by this that he wants you to go without your paper. He considers a good farm paper a war-time necessity. He knows that it means more to you now than ever before. But he expects business to be conducted on practically a cash basis nowadays, and he wants to relieve the paper shortage.

Look at the date on the yellow label and see if your subscription has expired. If it has, hustle along your remittance so that it will reach us before the new law goes into effect. Better send a couple of dollars or more, so that you won't have to think about it again for a long time.

Regret follows delay. Don't put this matter off.

Correct Lubrication for the Ford Engine

The Ford automobile engine, illustrated here, like all *internal combustion engines,* requires an oil that holds its full lubricating qualities at cylinder heat, burns clean in the combustion chambers and goes out with exhaust. ZEROLENE LIGHT fills these requirements perfectly. *because it is correctly refined from selected California asphalt-base crude.*

"Zerolene is the Best"

—Say leading motor car distributors, because the records of their service departments show that ZEROLENE, correctly refined from selected California asphalt-base crude, gives perfect lubrication with less wear and less carbon deposit.

Most cars are now lubricated with ZEROLENE because their owners have learned through experience that there is no better oil.

ZEROLENE is the correct oil for all types of automobile engines. It is the correct oil for your automobile. Get our lubrication chart showing the correct consistency for your car.

At dealers everywhere and Standard Oil Service Stations.

STANDARD OIL COMPANY
(California)

ZEROLENE
The Standard Oil for Motor Cars

Get Every Drop of Cream Out of the Milk!

Get Every Dollar of Profit Possible Out of Your Herd!

THERE'S only one way to do that. That is by getting every possible drop of cream out of their milk yield. Right **there** is where most dairy farmers have their profits stolen away from them. Wasteful separation methods—inefficient separators eat into profits faster than rust eats into a neglected tin roof.

Investigation covering six counties of one big dairy state show conclusively that an average of $20.00 per cow per year in cream is fed in skim-milk to the pigs. This loss is due mostly to the use of gravity or shallow-pan skimming methods. The farmer who uses no separating machine is, of course, the greatest loser. But those who use old and inefficient separators are also **big** losers. For your own sake—for the sake of the U. S. A.—

Stop Cream Waste—Save Labor—Use A

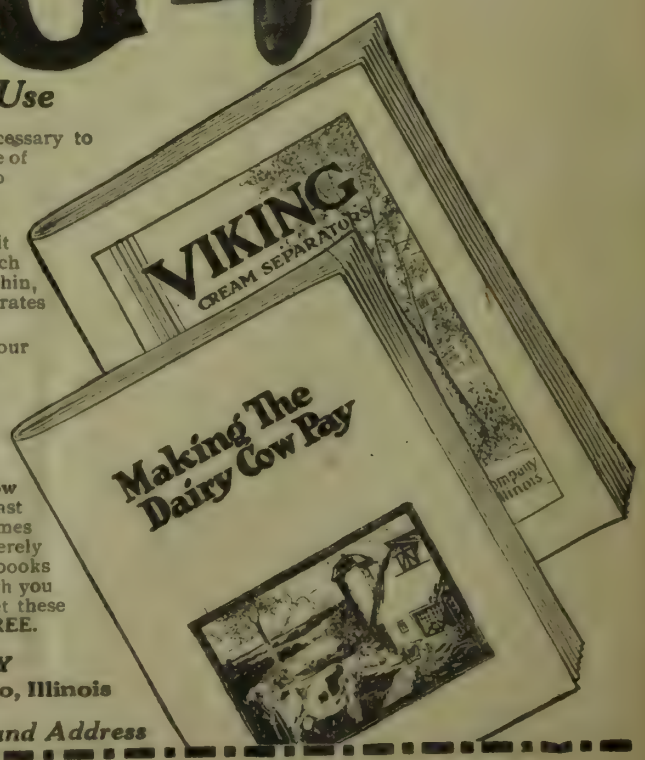
VIKING CREAM SEPARATOR

Over One Million Now in Use

The **need** for more efficient cream separation makes it necessary to produce over 180,000 **Vikings** per year. Each **Viking** is made of finest quality Swedish iron and highest grade tool steel. No separator **at any price** uses finer tool steel in its working parts.

It is marvelously simple in its design. That's one of the secrets of its economy of first cost—and also the reason why it operates so easily. The smooth, easy action of the **Viking** (which starts the minute you move the handle) distributes the milk in thin, even, smooth layers over the discs. The cream **naturally** separates from the milk. You get more cream and you do less work.

Learn **all** the facts in regard to the **Viking**. Don't do this for our sake. Do it for your own sake. Do it to learn **why** and **how** you can increase your dairy profits



These Two Books Will Show Any Dairy Farmer How To Make More Money

They are both fact-packed books. Just filled with ideas of **how** to increase the yield per cow—**how** to breed up the herd at least expense and in shortest time—how to know when a cow becomes a "boarder" and not a producer. These books are not merely advertising literature. They are helpful and authoritative books on dairy farming and dairy farming profits. Even though you don't think you will ever buy a **Viking**, write and get these books. We are not stingy with them. Both are **FREE**.

Greatest Tractor Demonstration in the West

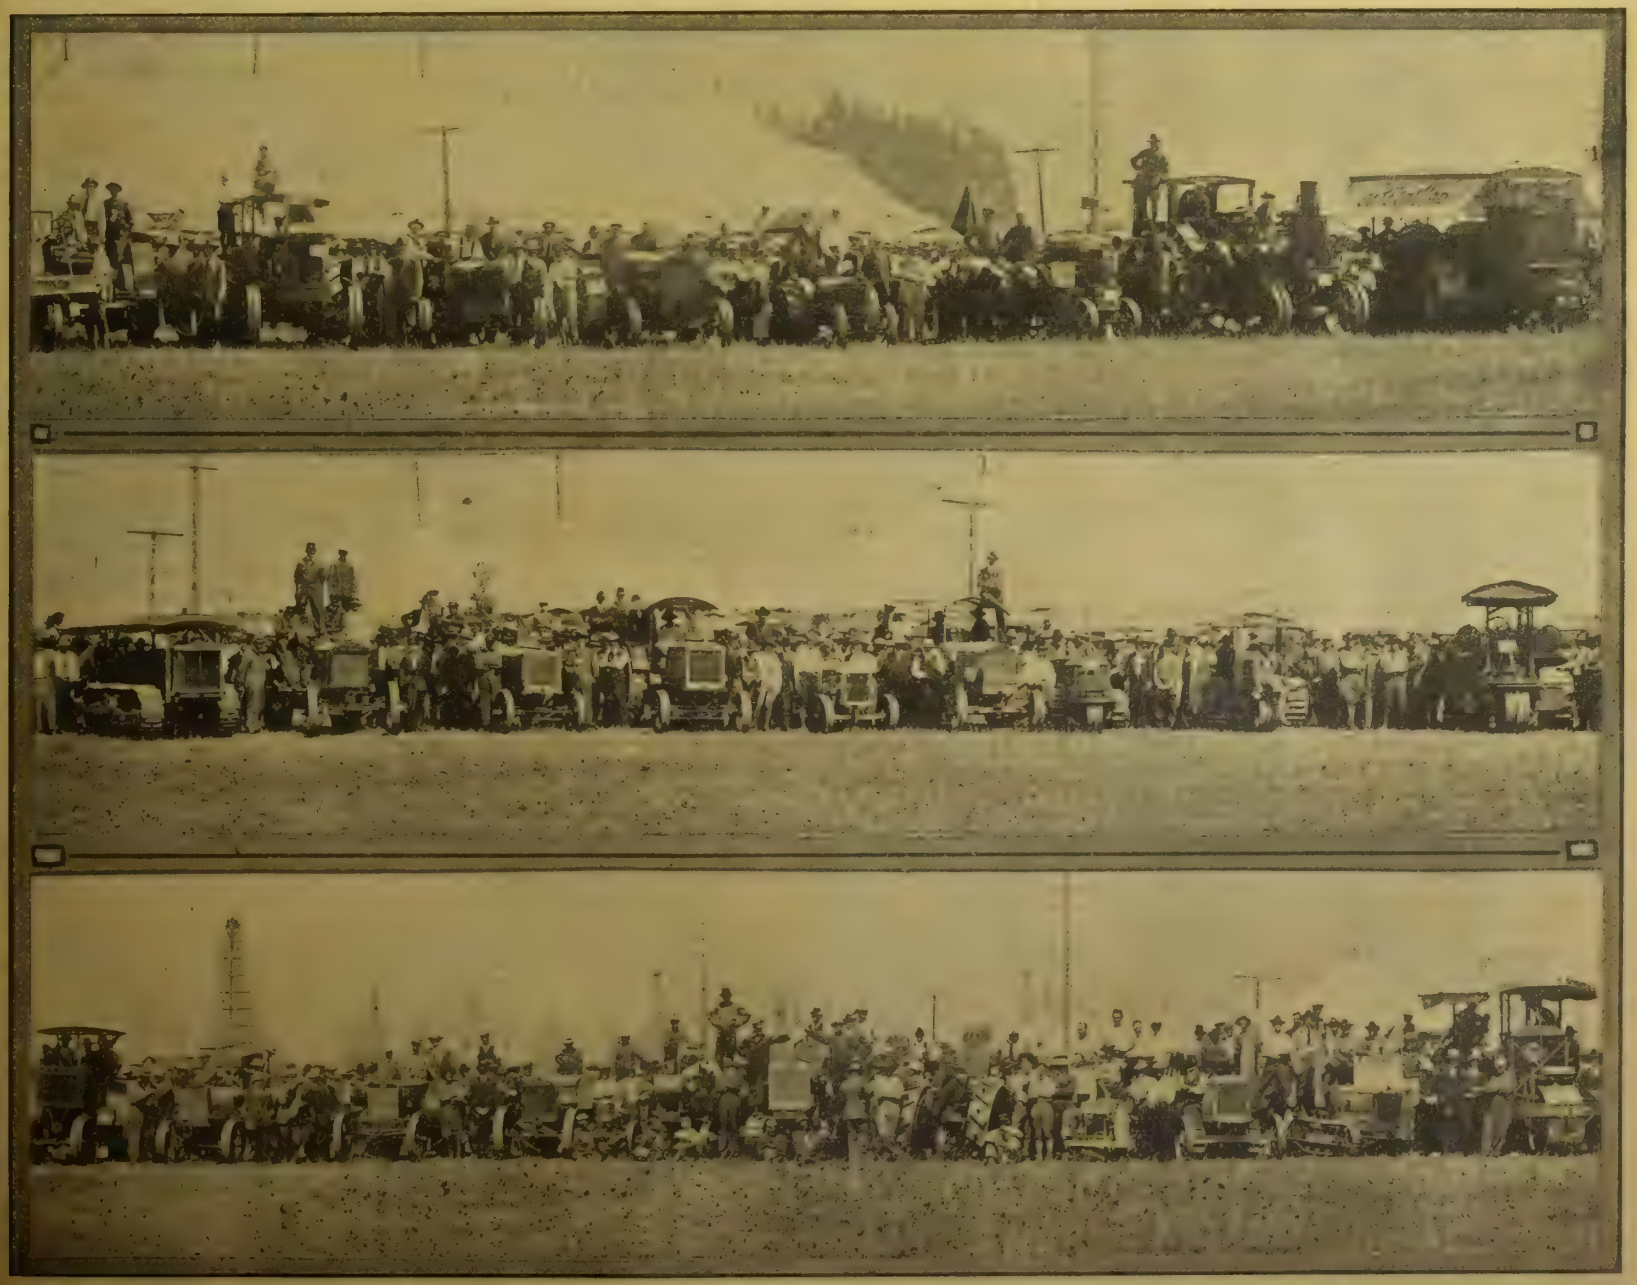
Written for Pacific Rural Press by R. E. Hodges

PASSING strange it is that the burial grounds of ancient flesh and blood mastodons should now be yielding oil that furnishes life to a myriad of modern mastodons of steel and fire. Curiously enough, it was this burial place and this source of life which was chosen as the background of a performance that signifies life to the human race. A forest of oil derricks was a fitting background for the greatest demonstration of the power of man to supply his most fundamental physical need. The modern mastodons, presaging bountiful food supply with the least proportion of human effort, performed magnificently, September 17 to 22, near the oil fields of Los Angeles, a spectacle that might well strike more terror to German hearts than as many cannon of great caliber. For with the splendid increase of dependable, man-saving, stock-saving tractors, the main German hope of dominating the world by starvation of its peoples has gone the way the Germans have been going since the food situation has become more settled among the allies. But where could such satisfactory fullness be found now, had it not been for the magnificent service of tractors, not only in producing human food but in saving millions of acres for production of human food instead of horse feed that would have been required!

Demonstrations Convincing.

Yet their work is not finished, their sphere of labor has wonderful room for increase, there are millions of farmers yet without sufficient knowledge of the absolutely necessary function of tractors in the universe. These millions of farmers become convinced when they see tractors actually operating under conditions that show ability to do farm work with less of human and livestock labor. It was to convince as many as possible, and to give them opportunity to select from the models available in the West, that the Los Angeles demonstration was carried out. Its influence will spread in unending circles by word of mouth of spectators, by reports in the farm press, and by the example set by those farmers who will soon have tractors because they saw or heard or read of the demonstration. Its success can never be measured. The credit is due to the Traction Engine and Implement Dealers' Association of Southern California.

(Continued on page 336.)



The above groupings are taken from a panoramic view of the very successful tractor demonstration held at Wilshire boulevard, Los Angeles, September 17-22, 1918.

BARLEY BUSTING.

BARLEY is surely the most rebellious beast in the food corral at this moment and any "buster" who can break it into some service which will bring back to the grower the big money it has cost him to drive it into the enclosure can surely command a profitable engagement. Many growers are working by organization and influence to get the barley situation into some reasonable shape, as we have shown in recent issues. Their undertaking is commendable and should have the strong support of all who have barley to protect and render profitable, if they can. Other growers are easing their minds by cussing the agencies which they believe have brought the grain into its deplorable plight. Colonel Irish orders out the kickers' battalion in his letter elsewhere in this issue. It is quite possible that both boosting and cussing may accomplish something—both are surely better than glooming and groaning and doing nothing.

WHAT IS THE MATTER WITH BARLEY?

IT IS apparent enough that the United States put in altogether too much barley last spring to serve the normal uses of barley in this country and was induced to do it for two reasons. One of these was the irresistible commercial impulse to grow a grain which would yield more bushels per acre than wheat and had sold for more dollars per bushel. The other reason, which encouraged the idea that the price would remain good, was the general exhortation that enough of any kind of food would beat the kaiser. Probably some growers also reasoned that as distillers of hard liquor had got it in their necks because other peoples' necks were closed to their product, therefore brewers of soft liquor would have a better chance at the aggregate thirst of the country and would be calling for a whale of a lot of barley to make at least near-beer in unprecedented volume. All of these calculations have been knocked out. Some of them disappeared perhaps in the way Colonel Irish points out—the final blow coming through the announcement by the Food Administration that, by the authority previously granted to the President, the manufacture of beer would be prohibited after December 1 next, as a war measure. This action, it is explained, was taken for the conservation of both coal and grain as well as transportation and labor for war work.

A GREAT "SHORT ORDER" FOR BEER!

OF COURSE, as the order to stop brewing on December 1 does not forbid the selling of the product on that date, but leaves the selling open for six months after that or until the going into effect, as a war measure, of national prohibition from July 1 next until the American armies are demobilized at the end of the war, it is clear that the brewers might calculate that beery Americans would desire to get full enough of it during the winter of 1919 to last them to the ends of their natural lives. If this calculation is sound, they might make enough money on post-December sale of pre-December brewing to cover the cost of their beer-making outfits and give them a good start in other business. If that is possible, they surely would make a drive for it. We do not know how true or possible it may be, but the situation might be much like that of our wine-grape growers who are getting fabulous prices for their grapes this fall because the cellar-men see such a chance for a turn in new wine before Uncle Sam's or some other line of prohibition ropes them.

But no such quick call for barley could reach our present barley surplus on this Coast. The national increase in barley production this year was about thirty million bushels over the average of five years preceding, or about 14 per cent, and practically all of it is nearer to the brewers of the Middle West than we are. Even if we had more of it, Mr. McAdoo would hardly be likely to let his trains haul it to minister to speculation in quick-turn beer.

Although we confess to not knowing much about it, we do thoroughly discredit the rumor that the Milwaukee brewers are so keen to accumulate beer for sale before July 1 that they propose to drive a bung into the neck of Lake Michigan, pump away the present contents through the Chicago drainage canal and use the cavity to store up beer for sale after their St. Louis rivals, who have no such storage capacity, are sold out. One obstacle, however, to all beer storage is found in the fact that all malting of grain for either "far" or "near" beer was stopped by the Government on September 21.

BARLEY SHOULD BRING A GOOD PRICE.

BUT though we are quite out of reach of all such great speculative possibilities for barley, we are quite sure that our growers who are holding barley should not too quickly sacrifice it. The Food Administration has just issued an exhortation to saving and a declaration that the need of food is as great as ever, if not more so, and that we must keep on sending it to Europe. Locally, however, it is unfortunate that barley flour is not popular as a wheat flour substitute. Though the millers say they can furnish it at about the top price for wheat flour, the demand is very light, as both bakers and family cooks refuse to use it except in very small amounts.

No one can tell how soon the ships which are being built in such large numbers on this Coast may take to carrying barley again, as they did a year ago and since then. As we have no wheat to spare to get in the way of barley movement, and as we have a decided advantage over the Middle West in getting barley aboard ships for Europe, our present barley surplus should not be sacrificed. Much of it should be going into pork and milk and eggs with at least as much profit to barley growers as they got last year—when the prices were boosted by speculators who gathered in most of the profits thereof. Let all who have barley in store join the new Grain Growers' Association and take part in the work of the barley committee of that association under the chairmanship of T. A. Kilkenny of Dixon. If our barley growers combine their knowledge and influence and take counsel together as to what courses to pursue, they can possess themselves of all the chances there are in the situation.

THE FARMER MUST TAKE HIS MEDICINE.

THIS is a time for every American to take his pills, and the Food Administrator will not give him any sugar to coat them with either. President Wilson administered such a dose to the striking shipworkers the other day when he told them if they did not quit striking for more pay they would lose their exemption as skilled workmen and would be sent to the ranks at thirty dollars a month. It seems too bad to make army service a punishment, but it must be remembered that, though service in the ranks is an earthly heaven to a man who has a well-spring of patriotism in his heart, it is also hell to a striking slacker who has no soul to be stirred by personal sacrifice for his country's glory. No such punishment threatens the farmer who is worthy of his country and his calling. Like his ancestors in the Revolution, if one pull at the trigger flashes in the pan he must clear the touch-hole, prick in more priming and try another shot. It is now no time for kicking if his country's servants, who are his rulers, are not always as wise as they ought to be. It is his business and duty to take another shot at production. If he gets a little chill in heart or pocket because some bunch of bureaucrats does not understand or appreciate his effort and his dangers, let him subscribe for another Liberty Bond, fill his head with fuller knowledge of what it is all about and warm over his heart with the thrill of being a serving, sacrificing patriot. No matter what other men may do, let him be right in the sight of his own conscience and let him recall the dictum of a democratic statesman of the olden time: "I would rather be right than President."

THERE WILL BE A TIME TO KICK.

BUT while we are positive that it is not now a time to arraign our authorities for ignorance, foolishness and self-interest, and certainly all of these things have a place in the current national attitude toward the farmer—the time is rapidly approaching when kicking will be both timely and the farmers' duty, not only for his own fairer treatment but for the general good of the country. The allies have the west front crumbling and shifting towards the Rhine; the south front is pushing northward all the way from the Trentino to Salonica; in Palestine they have already bagged fifty thousand Turks for an allied Thanksgiving. While these things are going forward for the welfare of all mankind, the farmer must be content that striking workmen will be stricken in their unpatriotic greed, that profiteers will be disgorged by the revenue collectors, and make his mind to go forward himself to maintain the national resources to the very best of his ability in spite of temporary injustice and sacrifice imposed upon him. His far-seeing patriotism should make it clear to him that present comfort is less important to him than to secure a world victory which will assure national stability and opportunity to right wrongs for all time to come and to attain the producers proper place in public affairs which has been a vain dream through all the ages which have passed. The present conflict will not attain that, but it will attain a fair starting point towards it. Therefore, it is not now a time to kick but rather to secure a firm footing from which to kick effectively. This will be the reward for patient, persistent, sacrificing patriotism, which is the present duty of all who are producing things needful to victory.

KEEP YOUR LEGS LIMBER.

OF COURSE, we do not mean that during the struggle for victory farmers should maintain sheep-like patience and patriotism. They should discern the rights of their industry, remind each other of them and fill the ears of all Americans with the sound of them, but still go forward toward their utmost attainment in production. While they thus give unyielding support to their armies abroad, they should put to flight the Midianites who prey upon their industry at home—the hosts of profiteers in labor and trade and the privateers in politics who are retained by them. And there is a great farmers' movement now taking form in Washington which aims to do just this. There was a meeting held in August in which farmers from thirty-seven States took part—California being represented by George A. Turner of Stockton, president of the California Bean Growers' Association, and perhaps by others also. At that meeting the following declaration of purposes was adopted:

Agriculture is the first, the most important and the most fundamental of all occupations. There is in the city of Washington no place where the farmers of America can bring together their interests and their needs. Labor, commerce and other great interests have established general headquarters through which their demands and desires can be promptly formulated and effectively transmitted to Congress and the executive departments. The farmers of America have never had such headquarters and have suffered greatly from the lack thereof. At this time the need for united action among American farmers is greater than ever before in the history of our country, and the service which a national headquarters for the organized farmers of America can render is greater than ever before. Therefore, the National Board of Farm Organizations approves the erection, endowment and maintenance of a temple of agriculture in the city of Washington to serve as a general headquarters for the organized farmers of America and a committee

of seven be appointed to prepare plans and to raise the necessary funds and procure by purchase or otherwise such a temple of agriculture.

This idea is not new. Three years ago a bill was introduced in Congress to establish a National Chamber of Agriculture—the proposition coming from David Lubin, founder of the International Institute of Agriculture at Rome, after careful study of the ways in which organized agriculture heads up against the national governments in Europe and secures its due influence in public affairs in several countries. The problems of the war interfered with the serious consideration of Mr. Lubin's plan. Since that time agriculture's lack of representation in councils which determined agricultural affairs has become more grievous and more clearly recognized by farmers. Every other great industrial interest in the country has mixed its own war medicine in Washington and compounded also the dose which farmers have had to swallow. And while the war is on there is nothing for farmers to do but take their medicine, as has been suggested. But when the victory, which now is clearly on its way, does come, the time will arrive with it for agriculture to assert its right to be heard and respected and to have governmental policies determined in accordance with its indispensable requirements. It is our farmers' present duty to keep their legs limber, for there will be high kicking to be done, and a good strong kick from the portico of the American Temple of Agriculture in Washington will be felt around the world. Californians should be getting ready for it. It is to this end that we have been exhorting all our producing groups to organize for their own affairs and for their own share in the general readjustment of production, commerce and finance in this country which will follow the war. Good progress is being made toward covering all our special products with co-operative selling and buying organizations. When they are all thoroughly affiliated in a representative State assembly, California can bid against the whole country for the choice of apartments in the American Temple of Agriculture in the national capital.

QUERIES AND REPLIES

By the Editor.

Inquirer Must Give Full Name and Address.

Split Piths and Split Pits.

To the Editor: In your issue of August 17 you tell an inquirer that you do not know the cause of split pit in peaches. I wish to give you my idea. If you plant the pits and grow them until they begin to bear fruit, there are no split pits. But you bud the young trees and set the bud on the side of the tree under the bark. Next year you cut the tree off above the bud and you have the pith half or three-quarters of an inch from the bud. The pit of the peach gets its main support from the pith of the tree. If you graft scions onto large stems, it is the same. But if you graft young trees with scions of the same size, so the bark on both sides connects them, the pith of the scion and tree are connected and you will have no more split pits. In the spring the tree begins to grow and make fruit crop, the sap clogs and does not get to the limbs fast enough to support the pit, so the fruit is bastardized. Apples and all other fruits lack their natural growth by budding large stems, but connect the piths by grafts and there are no more split pits, unless split limbs are allowed to remain on the tree.—Reader, Calpella.

The pith has no more to do with the growth of an exogenous tree than the hole in a doughnut has to do with the science and practice of nutrition. All our common fruit and other trees are exogens—that is, they grow by making new tissue around the outside of the stem just under the bark, which protects this growing-ring. In budding, the growing-ring of the bud is planted flat on the growing-ring of the stock, and that is the only place where a growing contact can be made. In grafting on a split stock the growing-ring of the scion must match or cross the growing-ring of the stock or there will be no growth at all. If you join the piths and do not make contact of the under-barks, not a graft will grow. The pith in a stem is dead as a mackerel—even deader than the hard old wood which surrounds it, because that, especially in its newer portions, does transmit some sap and holds the tree up—neither of which the pith can do, for it has neither sap nor strength. Your argument that the pith influences the growth and behavior of the tree, and in that way causes the pits to split because the piths do not join, has no foundation because piths never join and, because there is no growth activity in them, cannot do so. Our conviction is that you have another guess coming.

Sawdust as Fertilizer or Mulch?

To the Editor: What value has sawdust as a fertilizer and also what decomposed state would it have to be in to be of any value, and what, if any, would be the value of sawdust in soil as a mulch to keep soil from packing?—F. L. H., Modesto.

Sawdust is less valuable than straw as a fertilizer because, though it has about as much phosphorus and potash as straw, it has only about half as much nitrogen. But even this comparison gives sawdust too much credit, for the plant food in sawdust is so much more remotely available than that in straw because the latter decomposes so readily. In fact, sawdust is so slow that its contribution to an annual crop is almost negligible. Of course, discoloration of sawdust is not a measure of its decay. If it were, it might be claimed to become speedily available to feed plants. The action of sawdust in the soil is almost wholly mechanical and this may be either good or bad for a plant. It makes a heavy soil more mellow, helps its aeration and assists it to get rid of surplus water. On the other hand, it hurts a light soil because it makes it too coarse and too disposed to dry out. A mulch of sawdust is useful in reducing surface evaporation and holding moisture up for shallow-rooting plants, but as a mulch is soon worked in by tillage one has to remember to use such a mulch on a heavy and not on a light soil. It keeps a heavy soil from packing when used as a mulch and afterwards renders it less liable to pack.

Clovers vs. Bermuda.

To the Editor: Can you recommend any effective method of eradicating Bermuda grass, especially in alfalfa fields?—H. A., Shafter.

To the Editor: We have about twenty acres of otherwise good land badly infested with Bermuda grass. This land overflows during the winter season. What can we do to get ride of this nuisance? Will heavy pasturing have the same effect as on Johnson grass?—T. R., Grand Island.

No to the first querist; if the alfalfa gives it up we pass also. But perhaps you have a poor stand of alfalfa. If so, wet down deeply and get the land ready for fall sowing of alfalfa as fast as you can and resow generously and get as quick start as you can. Though alfalfa is very tender as a young seedling, it can grow enough in the fall to get quite hardy before frost comes on the plains, and then it grows at a lower temperature than needed to wake up Bermuda and with this advantage will fight Bermuda better than any other plant we know of, and the combination of the two makes fine feed or hay.

On the low land described by our second querist alfalfa does not have so good a growing chance and on such places we should put up red clover (Trifolium pratense) against it. It will stand the overflow and high ground water much better.

Heavy pasturing with un-ringed hogs will discourage Bermuda, but no pasturing will extirpate it. It will survive rougher treatment than Johnson.

Fall Irrigation of Deciduous Trees.

To the Editor: In fall irrigation, should the prune trees have lost their leaves or at least be autumn tinted before the water is turned on? A neighbor claims that as soon as the tree is dormant it is no longer in need of added moisture, as all function ceases. A number of us are interested.—Reader, Napa.

The rains have killed your question, but it may be well to remember that it is better to get on the water before the leaves show such signs of dormancy because when then applied it prolongs the activity of the leaves and their service to the fruit buds, as well as leaving enough moisture in the soil to prevent extreme desiccation, which kills rootlets. For this reason irrigation should be applied as soon as possible after the fruit is gathered. Late fall irrigation of dormant deciduous trees is only reasonable when the previous year's rain shortage leaves the soil extremely dry and fall rains are very late in coming. What we call dormancy is not complete inactivity and does not preclude the desirability of a certain amount of moisture in the soil. Dormant trees in a very dry soil will die by actually drying up just as nursery trees will dry dead if left too long on the freight-house platform. The same thing happens when dormant trees are frozen dry in more northerly regions. Freezing dry is measurably prevented by soil moisture and is understood by experienced growers in places where it is likely to occur.

SELL US YOUR TIME

Are you draft exempt? Have you an automobile? Are you free to travel? Are you convinced that the Rural Press is the best paper of its kind on the Coast and that it should be in every farm home?

If so, we need you to take the place of field men who have been drafted. Pleasant work, attending to our renewals and presenting the paper to those not already subscribers.

Straight salary; permanent work, with advancement. Lack of experience no barrier. If you are a live wire, are willing to learn and want to make more money, let us tell you how to do it. Our offer is a liberal one.

For a Heavy Flat Over Gravel.

To the Editor: I bought last year a piece of land which has been in grain for years and set out prune trees in March last. I plowed deep in April and disked and cultipacked it in May and June and got a heavy growth of morning glory. I cultivated it with a drag back of cultivator and got in three weeks another heavy growth of morning glory. Then I put on the weed-cutting blade and cut the morning glory, and now I have a heavy growth of it again. The soil is very heavy and dark 2½ feet deep, then the gravel starts and water appears at 4½ feet from the surface. Would it be advisable to transplant the trees this winter to another piece of land and put this flat into alfalfa? Will the alfalfa kill the morning glory, and will it be necessary to irrigate the alfalfa in order to get results?—H. H. B., Santa Rosa.

If you had purposed to get a full stand of morning glory, you could not have hit upon a better way to do it. We should transplant the trees to deeper land, free from gravel streaks and where there is more depth to water. Between the morning glory, gravel and high water your trees would not have much chance on the flat. Put in the alfalfa and let it fight the morning glory. It will not kill it out, but it will put it where the German army is now. The alfalfa will not need irrigation. It will probably not be long-lived, but it will put the land into good shape to get a whale of a crop of hay or grain in a very reasonable rotation and will be profitable both directly and indirectly if you work it right to get a good stand at first.

Longevity of Prune Trees.

To the Editor: I purchased in 1912 a prune orchard which had been neglected. There was a great deal of dead wood and I pruned the trees heavily, knowing I would have a small crop until new wood had time to grow. For three years I had very poor crops, but the crops of 1916-17 and this year have been very satisfactory. During these years I have put in cover-crops (vetch), irrigated and cultivated, and the fall of 1917 I put on some lime. I have also put down a deep turbine pump with good results. I also pruned carefully each fall. With this treatment, should the crops continue as at present? The orchard is about thirty years old. How long, in your opinion, should the orchard last? I have been told that with proper care it should last indefinitely. Is this your opinion?—G. H. K., Campbell.

If the trunks are sound, free from sunburned bark and burrows of decay from old wounds into the wood, and if the amputations of your severe cutting back in 1912 are healing over well, we should count on the trees for crops for fifteen or twenty years to come—perhaps longer—if they are kept in good vigor by such treatment as you describe. Keep them growing enough new wood, protect them from pests and especially guard against decay in trunks and main forks, and we should expect them to be serviceable indefinitely.

California Weather Record

The following rainfall and temperature record is furnished the Pacific Rural Press by the United States Department of Agriculture Weather Bureau at San Francisco for the week ending at 5 p. m., September 24, 1918:

Stations	Rainfall Data: Past Week	Seasonal To Date	Normal To Date	Temperature Data: Max'm	Min'm
Eureka	.02	1.83	.96	60	46
Red Bluff	...	7.08	.51	90	54
Sacramento	.02	3.48	.23	80	52
San Francisco	.01	2.53	.15	71	56
San Jose	.08	6.33	.26	78	48
Fresno	.07	.08	.10	92	54
San Luis Obispo	...	.61	.32	84	54
Los Angeles	...	.22	...	80	60
San Diego	.02	.19	...	74	58

Artificial Manures as an Auxiliary

(Written for Pacific Rural Press by John J. Fox)

THE use of the cover-crop in California is now becoming general. For our fruit-growing sections have not the stock to furnish their requirements in barnyard manure. But we don't expect the cover-crop to do everything—under all conditions.

I think on our very best bottom land the cover-crop will maintain the fertility of the soil almost indefinitely if persistently grown. But on the bench lands, sandy loams and upland gravelly loams we will have to supplement the cover-crop with artificial manures if they are to produce crops of fruit that shall be remunerative in quantity and quality. Artificial fertilizers are comparatively new to California, but their use has been steadily growing through the last 25 years. Not nearly enough public demonstrations on a commercial scale are being made outside the University of California.

We have already decided that we must depend largely on cover-crops, spoiled alfalfa hay, bean and cereal straw or chopped corn stalks, as well as barnyard manure, to furnish humus (and a part also of the chemicals) necessary to plant life. After awhile we become more or less satisfied as to what we can furnish our orchards and vineyards in our own localities at the least cost. But I have never yet met the grower who was perfectly satisfied with what he was doing in the shape of commercial fertilizers.

We ask ourselves the following questions: "Did I apply too much or wasn't it enough? Did it go on at the right time? Should I have plowed it in? Am I getting adequate returns for the outlay? Is the soil depleted by its use or have I still got something coming? Has any of it leached away or been lost?" These are all very pertinent questions, but they cannot all be readily answered definitely—not even by soil analysis. We only know that some plants thrive on what we provide for them and others cannot assimilate what we provide and show distress in their foliage just as a human or animal's condition is apparent through the skin or hair. As plants vary in their requirements both in form and quantity, so must we be ready to study and provide for them as we do for our livestock. But, just as it is easy for the stockman to feed away all his profits in the stalls—and incidentally produce indigestion if the feed is not judiciously administered—so can an orchardist throw away his profits by injudicious use of artificial manures, either by using too much at one time or expecting results from too little. For though the air furnishes moisture (or part of it), and the carbon in the form of carbonic acid gas, of which the greatest bulk of the plant is composed, it has to draw on the soil for the other essentials—potash, phosphoric acid, nitrogen and lime, and it is the aim of the farmer to conserve and increase these plant foods. First, by not drawing unduly upon the reserve that nature has accumulated in all soils; secondly, by keeping the soil well supplied with humus by whatever means; thirdly, by keeping up fertility by judicious applications of fertilizer sowed at the right time; and fourthly, by rotation of crops, careful tillage, draining and occasional liming.

Of the principal plant foods we have nitrogen, potash and phosphoric acid, also lime. Of these, the highest priced ingredient and the most volatile is nitrogen. Apart from the nitrogen obtained through the use of leguminous cover-crops, nitrate of soda is the one substance ready for the immediate use of the plant. It should therefore never be applied till it can actually be used by the plant, as it is not held by the soil and what is not used immediately will largely leach away with

> ***The science of fertilization of the soil can never become exact because conditions vary to such an extent in even one field as to preclude the possibility of uniform results. But all the time we are groping and striving for better results and—obtaining them.***

the winter rains or irrigation water. Also it should only be applied as the plant can use it, so far as can be judged, and not to exceed two or three hundredweight to an application, even for citrus. Where half a ton to the acre is used in the orange groves, it would be better for the trees and less loss if it were put on in several applications than in one, and surely less likely to disturb soil conditions and consequently the assimilating organs of the plant. Even sulphate of ammonia, which is held by the soil, would be better plowed in in the spring—except where there is a winter growth, though the nitrifying process of this substance is governed largely by plant requirements. Dried blood and tankage are excellent forms of organic nitrogen and their price is governed by their units of fertilizer. Fish guano contains both nitrogen and phosphate of lime and is especially valuable where there is plenty of lime present in the soil.

I have elsewhere alluded to nitrate of soda as a stimulant and I justify the statement in this way: That although it is one of the most concentrated plant foods we have, it draws on the soil for its balance of the plant ration. It is a stimulant as meat is a stimulant to man; being easily digested, but overdone, it weakens resistance. I have called the artificial fertilizers auxiliaries because that is what they are in fact. They only supply the soil with plant food and (except lime) do not exercise any apparent mechanical action on the texture of the soil.

And now as to potash. Most of our best soils in California are not deficient in potash, though some of our light lands are deficient. In experiments carried out in California on the best lands, no appreciable gain has been apparent in the trees or fruit, though I have never seen one carried out to its full end in weighing of the fruit. As it is so rare and high priced now, it is hardly worth discussing. As I have said, heavy land (clay loams and clays) are generally well supplied with potash. The commercial forms chiefly used are muriate of potash and sulphate of potash, though I still look for the time when Kainit may come back into its own in spite of its impure salts.

PHOSPHATIC MANURES.

Here we are generally all at sea. Every man says: "What form shall I use to the best advantage of my crops—the raw or the acid manures?" The raw phosphates comprise bones, Peruvian guano and basic slag or mineral phosphate. The acid manures are dissolved bones and superphosphate. The results of experiments both here and abroad have decided — generally speaking—that where the soil possesses plenty of lime, super phosphate or dissolved bones is probably the most efficacious and economical, while on soils deficient in lime, bone meal untreated with sulphuric acid or mineral phosphate would be preferable. But, broadly speaking, the most economical use of mineral phosphates is to make them into super phosphates, as this makes the phosphoric acid more readily available. This also applies to the bone meal.

Peruvian guano is richer in phosphates than is bone meal, but its quality varies in ammonia content, probably due to exposure. But where this is guaranteed by an accredited fertilizer company you are generally safe. The fish guano also contains phosphate of lime and nitrogen.

To show how rapid was the rise in use of phosphate rock—called basic slag—4500 tons were used in England in 1887. Three years later this amount had risen to 24,000 tons and its use has been increasing ever since. Good samples contain from 14 to 18 per cent of phosphoric acid.

In the amount to be applied it is absolutely impossible to make recommendations of the amounts necessary for different orchards. This must be apparent. For the physical condition of the same land in two different farms may be vastly wide apart, according as it has been farmed. However, we will take a good clay loam with an annual cover-crop. This crop has 1 cwt. of nitrate of soda to the acre three weeks before it is plowed in and preferably just after a rain. If necessary 1 cwt. more can be sown on at the first disking or cultivation. No potash, and if phosphate is needed it can be applied in the fall and worked in at the rate of half a ton to the acre, or superphosphate at two dressings.

Gypsum helps a legume crop as much as nitrate of soda under some conditions. It should be sown on when the leaves are wet preferably, and 2 cwt. to the acre is enough. The best time to apply is after a rain and when the weather is warm enough for the plants to grow. The effects of gypsum are more readily observed on light and especially chalky soil. Where lime is deficient its effects are much lessened. Except where it is used to neutralize black alkali, not more than 2 or 3 cwt. to the acre should be used. Where cover-crops are used and turned under green, and especially where sulphate of ammonia is used as a source of nitrogen, the land will need liming once every three or four years with from one to two tons of hydrated lime (at two dressings), or its equivalent in ground limestone. Gypsum or sulphate of lime does not possess the neutralizing qualities that hydrated lime does on an acid soil. But liming must not be practised too often or more than is necessary. There is an old proverb that runs: "Lime makes the father rich and the son poor"; that is, that it is possible by its injudicious use to exhaust the soil. And this exhaustion also takes place if a heavy "unbalanced ration" of nitrate of soda is persistently given. I have often wondered if this has anything to do with mottled leaf and other ills the orange is heir to. Mottled leaf is the outward and visible sign of an invisible unhealthy condition of the tree's system, just as a yellow skin shows on a man suffering from jaundice. Only we have been able to trace that to the bile. We have not yet discovered all there is to know about plant ailments. Yet it occurs to us that an insanitary condition of the soil or a plethoric condition of the root system may have something to do with it.

Of one thing we are certain. Now that our lands have become so profitable and high in value, we must learn to build up and sustain them to the highest stage of fertility or go broke. And to do this without throwing all our earnings back in the ground we have to learn to use cover-crops as a foundation and a judicious use of artificial manures as auxiliaries. And if we expect to get the whole of that money back in the fruit we imagine a vain thing. A part of that money spent for fertilizer has gone to build up the stamina and vitality of the tree. And that is obviously an unknown quantity.

Farm Products Must Increase

If we are to win the war and win it quickly our soldiers and our allies must be well fed. We cannot expect them to do their best to win unless we do our best to back them up. How are you going to make every acre of your farm produce to its utmost? Just as our army must be well fed so your soil must be fed. You must supply it with the elements necessary to produce crops.

GOLD BEAR FERTILIZERS

are scientifically manufactured to meet California soil conditions and crop necessities. They are made from animal products that contain the necessary elements to feed your crops.

Review of the Citrus Situation

[Written for Pacific Rural Press.]

Citrus growers' supplies are not all assured, but there is a big conservation job ahead of the growers which may result in enough to go around. A. E. Barnes of the Fruit Growers' Supply Co., the auxiliary buying organization for members of the California Fruit Growers' Exchange, believes there will be enough box shook for the fruit, though the sort of lumber it is made of is in heavy demand for other purposes. Delivery of nails is beginning to come freely. There is ample paper on the coast, though delivery has been slow both for wrappers and for labels. Citrus fruits must be wrapped to avoid excessive decay, but conservation pledges are being signed. Paste, which may not be made of wheat and corn as heretofore, is scarce and experiments have not developed a satisfactory substitute; but the supply company has dug up small lots at various places in America that had already been made up. Orange clippers, being made of high-grade tool steel, are hard to get and growers are being asked to send their discarded clippers in to have them repaired by experts to reduce the demand for new ones. Farm machinery is high priced and hard to get on account of the need for steel in war industries and the company is with the Government in urging that wherever old machines can be economically repaired to do efficient service new ones of the same kind should not be bought. Now more than ever before people should borrow and lend machinery wherever this will be economical.

Cyanide is plentiful on the Pacific Coast because less has been used for fumigation than in recent years. Liquid cyanide is still considered somewhat experimental and costs and results are being watched closely. Fertilizer is being demanded more all over the United States on account of the more intensive farming, while at the same time the supply is reduced. Use of potash as fertilizer was largely discontinued several years ago. Nitrate of soda and sulphate of ammonia are needed more in munitions than in soil and are being taken for that purpose. The supply company patriotically released to the Government a rather large shipment of nitrate which the War Board had approved for fertilizer. Slaughter house products, especially digester tankage, is being diverted from fertilizer into hog feed. There are practically no building operations now among the citrus exchanges on account of difficulty in obtaining hardware, lumber, labor, etc., and the undesirability of diverting them from more pressing needs.

ORANGES SCARCE.

There are probably not over 700 carloads of Valencias yet to be shipped, as against about three times that many which are usually on hand at this time of year. The Valencia season started earlier than usual on account of the navel shortage, but even Valencia shipments have been very light all summer. About thirty carloads a day are now going from California, distribution to small markets being restricted by high prices. The high prices are not staying with the growers, however, but are largely being spent on increased costs of supplies and labor and are not so big anyway because the yield per acre is short. No difficulty has been experienced in getting cars for shipment, but all are loaded to the maximum, 432 boxes per carload.

The coming Valencia crop gives good promise, but the northern navel crop seems to have been reduced by a heavy drop to about 35 per cent of what it might be; and the southern navel crop in California promises about 70 to 75 per cent. Sizes are likely to be correspondingly large.

CLEAN TRAYS.

Fruit trays and boxes should be thoroughly scrubbed with lye before being put away this year or the mould is likely to get into the wood and be ready to damage the next crop that comes in contact with it. The practice of stacking trays away on edge is a good one, especially where they are not under shelter. The rain runs right down through and they do not mould so badly.

Up to September 1 upwards of 200 carloads of fruit have been shipped from Placerville, including pears, peaches, plums and prunes—the most prosperous season the county has ever had as regards fruit. And the end is not yet.

A. Gunnarson of Kingsburg claims never less than 10 tons to the acre on his Levi Late cling peaches and will have 15 tons this year. Also last year he sold $525 worth of apricots from one acre—nine tons green.

GROZ-IT

HIGHLY
Concentrated - Pulverized
Manure

A mixture of cattle and sheep manure from animals fed on cotton seed meal and cake and alfalfa (highly nitrogenous foods) aged for several years under climate conditions that remove moisture but prevent leaching and fermenting.

No odor.
No flies or insects.
No weed seed or foreign matter.
Many times plant food values of ordinary manure.
Guaranteed contents.
Nitrogen, 1.5 to 2%.
Phos. Acid, P^2O^5, 1.25 to 2%.
Potash K^2O water soluble, 4 to 5%.
We are shipping GROZ-IT in immense quantities to Southern and Eastern states, where present freight rates make it $10 per ton more than cost to you.
Place your order now to insure delivery.
Sold in bags or bulk.
Write for circular and prices.

GIANT FARM POWDERS
STUMPING — AGRICULTURAL

For more than 50 years Giant Powders have cut the cost of western blasting. In all this time they have been constantly improved and adapted to western conditions by a western company. Naturally they make western land clearing easier, faster and cheaper.

Giant Farm Powders—Giant and Eureka Stumping—go further than ordinary dynamites. Farmers and orchardists find that they can do more and better work at less cost with Giant Powders. Hundreds write us that Giant brands "save money"—"give better results"—"have wider breaking power"—"shoot the roots"—and "are always uniform in strength and action."

Caution: Be sure you get the genuine Giant Powders, the product of the manufacturers who originated the name. Look for the Giant trade-mark. It is your only sure protection against imitations.

Send coupon (or postal mentioning this paper) for the big free book "Better Farming." It tells you scores of money-saving ways of doing farm jobs. Write for this gold mine of information today.

The Best Methods of Peach Pruning

[Written for Pacific Rural Press by John J. Fox.]

For the sake of knowing what kind of a tree we have to deal with, let us start by planting it and heading it 1 foot to 15 inches from the ground. As the inland valleys lead in the production of the peach, and it waxes warm there occasionally, we head the trees low: (1) For the purpose of affording shade to the trunk right from the start; (2) that we may gather our fruit at the least possible cost. And the more that can be gathered from the ground the greater the profit to the grower. It costs money to pick peaches from a 15-foot ladder and if the peaches drop onto a clod from up there they are wasted or injured.

VASE-SHAPED TREES.

Our little tree, if all goes well, makes a good, strong growth the first year, especially if it be judiciously suckered at the bottom. The leaders are thinned down to three or four of the strongest and are cut back to a foot to 18 inches, according to the strength of the wood. This will force a heavy wood growth for the following year. During the summer the horizontal and downgrowing suckers can be removed, being careful, however, to leave the small fruit wood in, to protect the tree. The next year one-half the wood will be cut back or perhaps more and thinning out of undesired laterals, from the inside if possible. In this way a vase or cup-shaped tree is obtained, which, though open in the center, has its branches protected against sunburn by inside fruit wood. Thus, fruit that is of good quality and color is produced inside the tree as well as outside. If one side of the tree is running away, prune it back heavier and give the weak side a lighter pruning so as to even things up. The wood growth is forced, then thinned till the peach tree has attained the size we want, the fruit being allowed to set on hangers and no shortening of fruit wood practised. Only thinning of them down and using those of a drooping nature, by preference. The heavy growth at the top is now kept cut back each year clear to the secondary buds, so that the tree shall go no higher. When the hangers have been used, they are cut clear back and new ones selected for the ensuing year.

EXCEPTIONAL YIELDS OF FRUIT.

D. L. Reed's orchard at Reedley is about as good an example of the vase system of pruning as I have seen. Last year he sold 51 tons of dried peaches from 17½ acres of orchard—a most exceptional yield. His trees are 10 years old, on sediment loam soil. He has plenty of water and irrigates twice. He will irrigate once more this fall. He checks and floods the ground like alfalfa, but it is easy to see that the trees must be of large size to be capable of bearing 3½ tons of dried fruit to the acre. They were headed at from 1 foot to 18 inches and are built with 4, 5 or 6 leaders at 6 feet from the ground. His trees were very small when planted, but were well rooted and well protected from the sun. On sandy ground he wishes his trees were even lower-headed. Protection from sunburn, both direct and reflected, is most important to the peach, and there is no reason why it should not always bear fruit from top to bottom—fruit of first quality. Last year five acres of Elbertas returned 12 tons of dried fruit, though they dried out over 6 to 1. Many trees produced 16 boxes of fruit. The Lovell is the favorite peach with him; it bears so well, dries well and the smaller fruit rapidly sizes up when the first fruit has been picked off. Elbertas bear more on the spur than on wood buds. If the tree is vigorous, the hangers do not set much more fruit than they can properly mature. Mr. Reed says it costs him about 8c or 9c a tree for pruning. He plows directly after the crop is off, then levees up and floods. The trees are well-built and generally sound and need far less propping than is usually necessary. I have mentioned this exceptional orchard because it is what is desired in the vase tree.

THE SIMS SYSTEM.

We recently called on William Sims of Farmersville (who originated this method), accompanied by C. F. Collins, Horticultural Commissioner of Tulare county, who described this method several years ago in an article which was published at the time. The trees are headed at about 18 inches and four or five main leaders are chosen from the new growth to make the framework of the tree. These leaders are all cut to a uniform height, which is governed by the season's growth. After topping, all laterals are removed from these leaders. The second winter these main leaders have all new growth removed from the top except one, which is allowed to continue its way upward and is topped at 10 to 12 feet. All laterals are also cut clear back that are larger than a lead pencil. Enough small laterals are left to completely shade the tree and provide fruiting wood. After this, each year cut out any larger laterals, leaving only the small fruiting wood and only as much of that as the tree should carry. The new heavy wood at the top is cut clear back to the secondary buds each year. This system seems adapted to the peach section of Tulare county, where the trees make a strong growth. The trees we saw are 23 years old and sound. They have never been propped because the upright character of the scaffold sustains the load. Mr. Sims claims that this system lengthens the life of the tree and his orchard certainly justified him in the assertion. I still think the vase system preferable because it gives a larger bearing area, shades the ground better and can easily be wired to sustain its load. Its fruit can also be as easily harvested, as so much of it is reached from the ground or from a light step ladder. Mr. Sims has 70 acres of peaches ranging from four to 23 years old—all pruned on the same system. The soil is a good sandy loam—second bottom land. He has Fosters, Muirs and Lovells (free), with Tuscan, Phillips and Sims Clings. The latter he sells through the local Cling Peach Growers' Association, which has 80 members. The water-table stands at 8 feet, and he never irrigates except in a dry season, and then only once.

THRIFTY AND PRODUCTIVE ORCHARDS.

His 60-acre prune orchard also is not irrigated. F. H. Wilson of Dinuba, president of the California Peach Growers' Association, has 80 acres of 15-year-old peaches at his home, pruned on the vase system, half freestone and half cling. Last year—an average crop—there were 130 tons of clings shipped and 50 tons of dried peaches.

This place is irrigated two or three times a year. Probably an average crop on upland will run in this district about one ton of dried fruit to the acre.

One of the most thrifty young peach orchards I have seen was that of Nicholas G. Nelson, president of the Farmers' National Bank at Kingsburg—80 acres of Tuscan Clings, four, five and six years old, pruned on a modification of the vase system. The ground was well shaded and fruit wood hangs to within a foot of it. Last year 375 tons of peaches was marketed from this baby orchard. This year the frost cut down the crop to about a ton to the acre. The general price was $65. This place is irrigated twice a year. It is on the banks of Kings river and a subsidiary pumping plant has been installed, so this year it will have a fall irrigation.

Except in the Farmersville district, where the Sims system is in vogue, the best system of pruning peaches is the vase or a modification of it. A low heading, the fruit grown on "hangers" and the top of the tree kept within due bounds—not higher than it is profitable to pick rapidly.

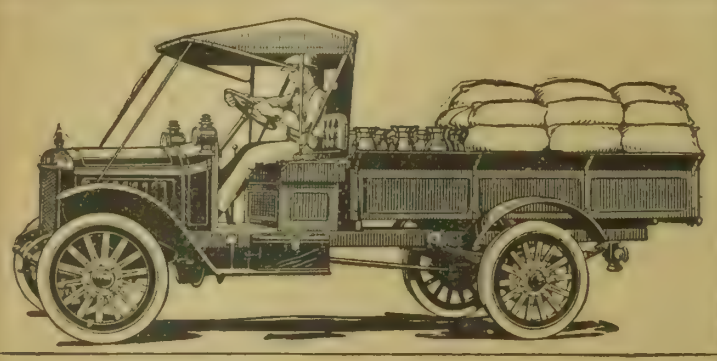
GRAPES AFTER THE RAIN.

It is reported from Napa and Sonoma counties that grapes are in a delicate condition after the rain. Clark Fawver of Oak Knoll says that Malvasias are badly split and there is quite a little rot in the Sauvignons. Alicantes are dropping at a touch and in some places Zinfandels are past redemption. The loss in sugar has, of course, been heavy in all varieties and the best of weather will not give it all back. The 22 per cent sugar content demanded on contract sales will have to be lowered. Vineyardists are getting their fruit to the crushers as fast as condition will permit. A few days of good warm weather will add rapidly to condition. Fortunately a very large proportion of the fruit is well up on the vine. All that fouches the ground is gone. Where there is a heavy foliage some mildew is present. Every man is "up o-comin'" now—nobody is taking it easy these days. More power to his elbow.

EARLY RAINS AND PEAR BLIGHT

In view of the new growth in pear trees that has lately been started by the rains, State Horticultural Commissioner George H. Hecke has issued a warning to pear growers to be on the lookout for pear blight. The young growth will be susceptible and blooming is probable under certain conditions—has indeed been reported. Mr. Hecke recommends careful inspection of trees till the danger is over. Should any blight appear, it must be cut back at once. He reports that Dr. F. C. Reimer of Oregon, the noted pear expert, recommends cyanide of mercury to disinfect cuts and wounds instead of corrosive sublimate—1 grain of pure cyanide of mercury to 500 grams of water.

Haul your produce to the best market



A Republic Motor Truck makes it possible for you to deliver whatever you have to sell to the *best* market.

You are not limited to the markets which lie within a six or seven mile radius of your farm. Many farmers are hauling their produce with Republics, twenty miles, forty miles and even further. They go where they can get the best prices and make the trip quickly and economically.

Republic Motor Trucks will make money for any farmer if given the opportunity. They combine every feature necessary or desirable for farm use.

The Internal Gear Drive delivers more power than any other form of drive. It permits the use of a separate load carrying axle of solid forged steel—the lightest and strongest axle known to engineers. It gives 45% greater road clearance, preventing stalling in mud or snow. There is less unsprung weight which means big savings in gasoline, tires and all upkeep expense.

Republic Trucks are easy-riding and easy to drive and care for. And there are seven models from ¾ ton to 5 ton capacity so that you can select just the truck needed on *your* farm.

The Internal Gear Drive delivers 92.5 of the motor power to the wheels. We know of no other drive that delivers as much.

Republic Trucks are built by the largest manufacturers of motor trucks in the world who build nothing but trucks and know just what is required for every kind of hauling. Last year more than twice as many Republics were produced and sold as any other make.

1300 Service Stations, distributed all over the United States, insure prompt efficient service no matter where you may be located.

See the nearest Republic dealer and write us for latest booklet.

Further County Crop Reports

[Written for Pacific Rural Press.]

From Ventura county, Professor E. O. Essig, County Agent of the Department of Agriculture, reports: Beans being harvested. Prospects for a normal crop; slight damage by rain. Citrus fruits practically a normal crop. Lemons especially good. Walnuts beginning to drop; nearly normal crop. Nuts of especially fine quality—free from blight and other injury.

Last week's report from H. H. Ladd is borne out by later reports this week. Beans practically undamaged. Injury to grapes, prunes, barley and hay not yet determined. Late beans, which may be started out into vigorous new growth, will be cut or pulled at the usual time.

County Horticultural Commissioner Lamiman of Shasta county reports no damage to prunes or peaches. Will hasten maturity.

County Horticultural Commissioner A. L. Rutherford estimates the greatest loss in his county to figs; 75 per cent spoiled. Beans and corn will not be injured by the storm as a whole.

M. J. B. Neff of Anaheim reports for that section 75 per cent of a crop of oranges, 85 per cent of lemons, 80 per cent of walnuts, 70 per cent of beans, and tomatoes poor. "Walnut gathering has begun and the quality is excellent—probably the best we ever had."

Sheridan W. Baker of Santa Rosa reports grain in Sonoma county 10 per cent damage from rain, and hay perhaps 15 per cent.

George Marchbank, Horticultural Commissioner of Madera county, reports that practically no damage was done to any crop in his county excepting figs, and he estimates the damage to them at 10 per cent.

Little real damage was done to crops in Merced county, as reported by Arthur E. Beess, County Horticultural Commissioner. Figs suffered worst. Probably one-half of the White Adriatics and one-third of the Smyrnas were under cover. The figs on the ground suffered most; those that were not picked up promptly. All of these had to be washed and many of them have soured. A large proportion of the riper figs on the trees have been split and soured. Practically no damage to raisins and no noticeable increase of mildew apparent on shipping grapes, though many bunches that touched the ground have begun to decay. No injury was done to beans or sweet potatoes.

Charles F. Collins, Horticultural Commissioner of Tulare county, reports figs a normal crop, but sizes running rather small. Prunes are 60 per cent of a crop and 75 per cent of them are cured. There was no rain and the weather is most favorable possible for the curing of crops. Valencia oranges are about 45 per cent of a crop and navels 25 per cent.

Nevada county reports little damage and more benefit from the heavy rain. The young orchards will be invigorated and the green feed is most timely and needed. All the stockmen in the hills are well pleased. What little old pasture was injured is more than made up by the new growth.

J. H. Stephens, president of the Rice Growers' Association, predicts an increase of the rice crop of from 10 to 15 per cent as a result of the rain.

Salinas growers have been hard hit by the recent storm. Schools have been adjourned to allow the children to go into the fields to help handle the crop. The extent of the loss will depend on weather conditions. A fair wind and sunny days are badly needed to relieve the situation. E. E. Kaufman of the U. S. Bureau of Crop Estimates says: "The greatest loss to bean growers is in the Salinas Valley. No estimate of this can yet be made. Next in importance are losses in Sacramento and San Joaquin Valleys. Damage in the south is negligible. The damage to prunes is probably more than half the crop. There will be some small loss to late canning peaches. Of table grapes the Tokays bore the brunt of the loss."

T. C. Tucker, manager of the California Almond Growers' Association, reports that damage to almonds is chiefly confined to Drakes, Languedocs and Seedlings, and consists in stain damage. These can be shelled and sold as shelled almonds and of course the returns on this fruit will be proportionately less.

Berkshire Breeders Set a Hot Pace

[Written for Pacific Rural Press by R. H. Whitten.]

Step aside, all ye breeders of other kinds of hogs, and make way for the Berkshire boosters. For the stunts they performed at the State Fair and the plans they laid for the future certainly entitle them to first place in the swine breeders' Hall of Fame.

First of all, they had Judge Thatcher explain, after judging each class, why he placed the awards as he did. This plan gave universal satisfaction. Some exhibitors were a little sore when the ribbons were passed around, but after Mr. Thatcher had given his reasons all dissatisfaction disappeared like dew before the morning sun. Those who failed to win understood why, and they went home determined to breed out the faults that the judge objected to, and to come back next year with a herd that would surely win. "It doubled the value of the judging," was the universal opinion.

Then these live wires held a sale of young sows. They first had all of them judged, and donated the winner to the Red Cross sale. Then they sold the balance, and the proceeds went into the treasury to be used for promotion work. Two hundred and fifty dollars of the amount was given as extra premiums at the Fair, a large proportion of it going to exhibitors who had never shown before. A fine stunt to get beginners into the show game.

At this same sale, in order to induce liberal bidding, purchasers were offered free the service of any boar owned by any breeder represented. Think of it—a purchaser could have his choice of almost any blood line of the breed and could have his sow bred to one of the best boars of that breeding! What an opportunity to start constructive breeding!

Another similar sale of 50 head will be held at the Los Angeles Liberty Fair, but here these progressives will go a step further. They will appoint a judge, who will inspect the stock consigned to the sale, and all animals not up to a very high standard will be culled and sold to the butchers.

At this Liberty Fair $250 will be contributed from the Berkshire Congress treasury—two-thirds to be added to the regular premiums and one-third to be offered to breeders who have never exhibited before.

Here's another original stunt: A killing contest will be held, and one of the leading Los Angeles packers will have charge of the killing, chilling and judging. Then the winning animals will be put up for sale. The amount that the carcasses bring over what ordinary carcasses would sell for will be determined and the excess will be donated to any patriotic organization designated by the breeders.

How many breed organizations have taken enough interest in their work to have a special day named for them? The Berkshire fellows have, and Thursday, October 24, will be officially known as Berkshire Day. The killing contest will occur in the morning; the sale will be held in the afternoon; and in the evening a banquet and meeting of the Western Berkshire Congress will be held at the Alexandria Hotel, which will be headquarters for these breeders during the fair.

Our space is too limited to tell you about all of the plans that these originators have up their sleeves, but we have said enough not only to prove that they are worthy members of the Brotherhood of Brains, but also to warn other breed organizations that they will have to buck up.

Organization is necessary to put any breed to the front. But organization alone won't do the trick. An organization is like an axe—what it accomplishes depends upon the man power behind it.

We have plenty of breed organizations in this State, but too many are half asleep. They hold annual meetings and elect officers; they transact routine business; they sometimes hold a banquet and have a jolly good time. But they do very little real promotion work.

This paper is not for any one breed or set of breeders. We are for more and better livestock of all kinds and all breeds. We will gladly help any breed association in its work, and there is always space in our columns to tell of such constructive work as that being done by the Berkshire breeders.

Don't try to imitate them, for you know imitation is the sincerest form of flattery. And besides, the imitator is always a lap behind the originator. There is no corner on original ideas. Plan some real novel, practical stunts that will make the Berkshire fellows look like a bunch of amateur pikers. We'll back you up in every progressive movement you undertake. You'll find us right there, ready and willing to do our part.

The reason for choosing the Salway pit for planting for tree stock is (1) that it is hardy and makes more growth; (2) continues to grow later in the fall and is not inclined to sucker.

PEELING PEACHES FOR DRYING.

To the Editor: How are peaches peeled for drying? They were formerly peeled by hand after sulphuring, and at Fresno they peeled them with lye. But they have a new way of doing it now.—Anton Kerz, Ramona.

[The peeling of ripe peaches for drying is still carried out by small growers by hand, directly following the sulphuring process. Hot lye is also still used. The dried peach peeling process under the Beekins patents have been issued to and are controlled by the California Peach Growers, Inc., at Fresno. The Dunkley Company of Michigan appealed against a decision that their patent rights in fruit-peeling machinery in canning operations had been infringed by the peach-peeling machines used by many of the canners in California, but the case is not yet settled, as notice of appeal has been entered.]

Farmers' short courses will be held at Davis, Sept. 30 to Dec. 13, 1918.

Here and There in the Fruit Business

[Written for Pacific Rural Press.]

Berryessa Valley.

Cook & McKenzie of Monticello, Napa county, shipped 6000 boxes of Bartlett pears this year out of a possible 10,000. One thousand boxes were shipped from 200 trees. Under average conditions, $1.25 a box is netted. This means net on the trees, after paying cost of cultivation, pruning, etc. These gentlemen have planted extensive young orchards and have 200 acres set to trees, including 40 acres of old prunes and a considerable acreage started into bearing. This year they will have 150 tons of dried prunes of fair size and quality. H. J. Knowles, also of Monticello, has planted 75 acres of pears on the old Coleman place and 25 acres of French prunes. It is expected that the Berryessa Valley will plant out some hundreds of acres more to pears, as this is a pear section.

Jam and Apricot Pits.

All the apricots used by Crosse & Blackwell used to come from California—boiled to a pulp and shipped in 28-pound tins. When we start Jam-making we can beat the world in competition provided there is no duty on cane sugar. The Prune and Apricot Growers' Association is handling an immense pit-cracking plant on the Campbell Road. The shells are sold to the Government to make carbon used in gas masks, and the kernels make essential oils and are used (when blanched) by jam-makers to improve the flavor and appearance of the apricot jam. Some day they will be kept in the State to go into our own made jams, which will be distributed "all up and down the world" in American ships.

Care of Soldiers' Orchards.

Officials of the California Fruit Growers' Exchange are working out plans whereby expert care will be given to the orange groves of all members, without charge, after their enlistment or call into the military establishment.

Indications are that a considerable number of property owners will be inducted into the service by the terms of the new man-power bill, and those members who so desire may arrange for the handling of their property during their absence.

A form of contract for the work has been approved by attorneys for the fruit growers' organization.

Commercial Varieties of Fruit.

In planting out a young orchard on a commercial scale it is most important to keep strictly to commercial varieties and those for which a market has been created and which the market demands, no matter what kind of fruit you favor. The newcomer to this State especially must find out (1) what he wants to grow; (2) has he suitable land and a proven location; (3) if he can get trees of a marketable variety. There are too many "seedlings" of all kinds in the State today. The sooner varieties are combed down to a few leaders of each kind of fruit, the better for the whole industry of horticulture.

Portuguese Export of Olive Oil.

As olive oil is considered a necessity in Portugal and as the future crop of olives will not be equal to the local demand, the Government has prohibited its exportation, excepting to the islands of Azores and Madeira and the African colonies. Sardine packers are prohibited from using olive oil of more than one degree acidity and must pay a tax on all oil used, either domestic or foreign, amounting to 0.20 escudo per kilogram. Prices of olive oil are fixed at 0.60 escudo per liter to the producer, 0.68 escudo to the wholesaler, and 0.72 escudo to the retailer.

Shortage of Labor.

Placerville has experienced a shortage of labor in the fruit harvest, the reason for which is not clearly explained. A good many tons of pears that ripened faster than they could be dealt with were hauled away for hog feed. The land army has been utilized to its fullest capacity by a few patriotic ranchers and has aided largely in competition with Oriental labor. With the exception of one local merchant, every store in Placerville tendered help to take care of the crop. If there is a nigger in the woodpile, it is better to put him to work than to destroy the woodpile during war time.

Government Buying Apricots.

The Government has bought 1300 tons of dried apricots, which will doubtless help as much as anything to permanently extend our markets for this delicious fruit, which at present is not as widely known as it deserves. "A change is the spice of life," and the British Tommy always welcomes a change from his eternal ration of plum jam—good as it is. The fruit that our boys get will surely be sampled by their brothers-in-arms, no matter what it is.

Record Crop of Apricots.

For the last seven years the average production of apricots on a green basis has been 110,000 tons. In 1917 it was about 125,000 tons. This year the estimated production is for a crop of 160,000 tons—the largest the State has ever produced and easily and satisfactorily marketed. The Prune and Apricot Growers' Association has relieved the grower of that anxiety.

Nursery Notes—Suggestions to Planters

[Written for Pacific Rural Press.]

We have recently taken a trip through Fresno, Kings and Tulare counties and visited some of the large nurseries on the way. We found that, owing to the requirements of the Government regarding concentration of effort on necessary industries, fewer ornamentals were being prepared for the market. The Fancher Creek Nurseries are not propagating anything useless—not only on account of the extra labor involved but also to conserve every ounce of fuel possible. And greenhouses can not be run for propagating purposes without some artificial heat.

We found that about 50 per cent of prunes and plums are budded on Myrobolan stock, with peach root running second. Santa Clara Valley and clear on down into San Benito county will plant a large acreage of apricots on Myrobolan—chiefly Royals and Blenheims, together with a sprinkling of Moorparks and Hemskirks. Generally, planting of new acreage is expected to be governed in some degree by the labor supply. If that supply is forthcoming, a normal planting is looked for. Demand for new stock is so far about average of other years. Stock is good quality and clean but a little short of average supply. Mr. Moliere, manager for George Roeding, said: "Next year we don't know what labor will be available for the nurseries, in view of the draft."

There will be quite a run on pears and peaches, as well as prunes. And if all the vines we saw in the vicinity are set out there is going to be a large added Muscat and Thompson Seedless acreage. There is a little better than a normal demand for Bartlett pears — chiefly on Japan root, but some on French.

The seedling plantations are in first-class condition and have made good, thrifty growth. The new Calipper method of grading should prove

A Pennsylvania Farmer Says Concerning Electric Motors on His Farm

"A one-horse power motor is located in the spring house for separating milk, churning butter, turning a grinding stone, etc.

"In the house, my wife has a ⅙-horse power motor for running a washing machine. This motor can be attached to any lamp socket.

"In the barn a 15-horse power motor mounted on a little truck may be moved to any part of the barn or barnyard for grinding feed, baling hay and threshing grain. By extending the cable we have used this motor 400 feet from the barn."

This letter suggests equally profitable installations around your house and barns. The General Electric Company manufactures all sizes of electric motors for farm use. Information will be gladly furnished by your lighting company or our nearest motor agency.

MORSE'S SEEDS FOR FARM AND RANCH

YOU MIGHT AS WELL Plant the ORIGINAL

strain of Hairy Peruvian Alfalfa—and plant now! When you plant Morse's you know that it is not only true to strain but of proved germinating power. In common with all other Morse's Seeds, it is specially selected, extra recleaned, soil-tested.

Morse's Hairy Peruvian Alfalfa

will make money for you because: It starts before other alfalfas—stands greater extremes of temperature—yields an EXTRA cutting per season—and always produces heavily.

Remember—no matter when you plan to put in your alfalfa—BUY YOUR SEED NOW! And see that it's Morse's. Big demand—limited supply—prices apt to go up any day. Order by mail or wire!

C. C. MORSE & CO.

Seedsmen and Seedgrowers

731 Front Street :: San Francisco

satisfactory to both grower and planter.

It will be well for growers to plant up the misses and vacancies in their young orchards before launching out into new acreage. This is a thing that is sometimes overlooked—I plead guilty to it myself—but the ground has to be worked over anyway. Also, growers should get in their orders as early as possible and plant early. If not quite ready to plant, the stock should be heeled in upright, in a good deep trench, with the earth filtered through the roots and firmed to exclude the air. To order early means that the trees are on hand, thoroughly inspected, whenever the orchardist gets ready to plant. A low spot not well drained must be avoided in heeling in.

M. Jackson, manager of the Fresno Nurseries, ran us 'round to several of the plantations of nursery stock. In speaking of newly planted trees sometimes making a poor start, he said: "Don't sucker the young trees too early after they start growing. Wait until the buds you want have made some growth. Then you can remove the suckers and concentrate the energy of the young tree on the shoots you want to keep." We noticed some young trees last year whose terminal buds were almost destroyed by thrips just after they broke into leaf.

All the large nurseries are as keen on bud selection for improvement of type and production as cattle breeders are for pedigreed sires. It is the irresponsible alien and the cheap-tree peddler from God-knows-where who is responsible for much of the disappointment experienced by small men of small means. The business grower knows better than to buy cheap stuff from an unknown. The foundation of his business must be built of the best material he can obtain. Summary: Regard with suspicion unknown stock whose only recommendation is that it is low priced. Order early; heel in promptly; plant with care. To which may be added: "Protect from the south and western sun."

And now regarding the varieties that are in best demand by the markets. In prunes the first preference is, of course, for French, then Clairac Mammoth, Sugar and Robe de Sargent for drying purposes. For shipping green, the Standard, Sugar and Tragedy. The latter is more of a plum. The Silver is not a commercial variety for drying and is not recommended.

Plums.—The President is becoming a favorite; Burbank, Wickson, Hungarian, Giant seem to be in the lead.

Peaches (early). — Alexander, Hale's Early (second early), Foster, Early Crawford. Free (drying or shipping).—Lovell, Muir, Elberta, Susquehanna, Wheatland, Salway. Clings.—Phillips, Tuscan, Orange, Levi Late. Many other varieties are also local favorites.

Pears. — First, Bartlett. Good quality and shipping varieties which are growing in favor are Beurre d'Anjou, Comice, Winter Nelis.

Cherries (early).—Purple Guigne, Chapman, Rockport. Main crop.—Black Tartarian, Royal Ann, Bing, Lambert.

Apricots.—Blenheims and Royals first; then Tilton, Hemskirke and Moorpark.

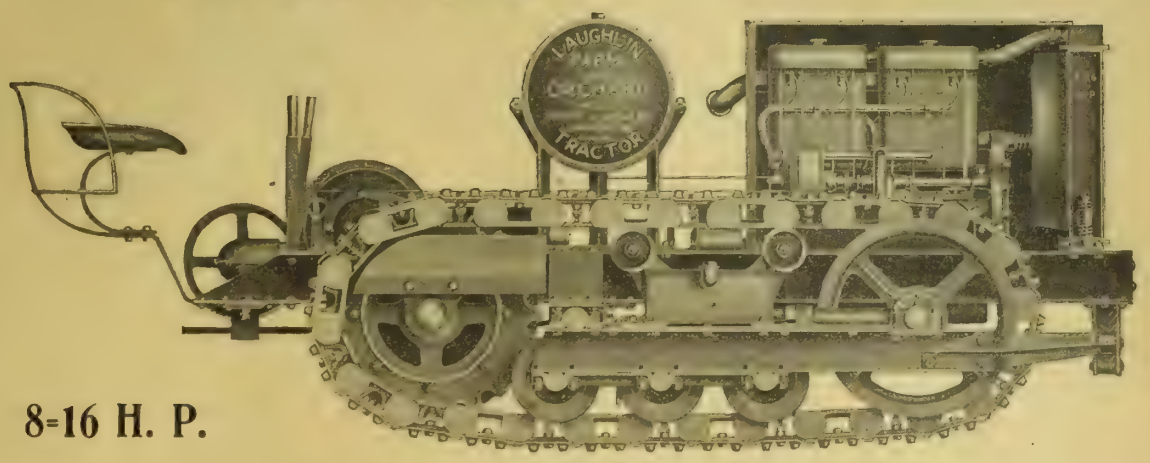
Almonds.—Nonpareil and enough Drake's Seedlings for pollination; also I X L, Ne Plus Ultra and Peerless. Texas Prolific has limited market.

Walnuts.—Franquette, Placentia Perfection, El Monte and Eureka in the south; Franquette, Mayette, Concord and Eureka in the northern part of the State.

In both almonds and walnuts there is said to be a limited demand for hard-shelled varieties on the part of "genteel" hotels and those who desire that their guests may not consume in an absent-minded way more than is really good for them. Also the necessity of using mechanical means, such as a hammer or shoe heel, for extracting the kernel often affords relief and even entertainment during post-prandial speeches in small municipalities.

Little Husky TRACTOR

Compact
Powerful
Durable



8-16 H. P.

Built to meet the severest tractor plowing conditions.

There are a number of patentable features on the **Laughlin "Little Husky"** Tractor which have been developed and perfected by a man who has followed the trend of the creeper type of tractor since its inception. He has studied and overcome the difficulties of the past and has produced a dependable machine, embodying improved features.

The oscillating frame is hinged independent of the sprocket axle and takes all the strain off from the track drive gears.

The track links are really a solid railroad tie with no loose spools or pins to work out and delay your plowing.

The "LITTLE HUSKY" Tractor is not an Experiment

Some Distinctive Features

Valve in Head Motor—Enclosed Valves.
Two Independent Side Clutches—Enclosed.
Large Cooling Fan—Gear Driven.
External Cut Drive Gears—Enclosed.
Spring Mounted Radiator—Perfex.
Stationary Drive Pulley.
Dixie High Tension Magneto—Impulse Starter.
Patented Sure-Grip Track Links.
Laughlin Heavy Duty Slow Speed Motor. 700 R. P. M.
Demountable Sprockets, Rim Mounted on Hyatt Bearings.
Double Flanged Idler. Mounted on Hyatt Bearings.
Transmission—Sliding Gear Type, Enclosed—running in oil.
Sent on request—descriptive literature, giving full specifications.

THE SELF-OILING WINDMILL
has become so popular in its first three years that thousands have been called for to replace, on their old towers, other makes of mills, and to replace, at small cost, the gearing of the earlier Aermotors, making them self-oiling. Its enclosed motor keeps in the oil and keeps out dust and rain. The Splash Oiling System constantly floods every bearing with oil preventing wear and enabling the mill to pump in the lightest breeze. The oil supply is renewed once a year. Double Gears are used, each carrying half the load

The rain damaged only slightly the grape crop around Winton.

The Latest on the Prune Situation

[Written for Pacific Rural Press by John J. Fox.]

We reported last week the state of affairs in the great prune section of the Santa Clara Valley. At this writing, September 21, things look a little brighter. If the weather is propitious and keeps clear, the Vacaville section will not lose over 10 per cent of the crop. They have had the sun over there. And the rain has put their orchards into such fine shape that their gains far outweigh the individual losses of fruit, though all their figs are gone, too.

The Napa and Sonoma people had much of their fruit stacked and most of this is fairly safe except the last dips, but it won't stand very much more inclement weather. If the weather clears up and is good from now on, the loss in Napa county should not exceed 25 per cent, and it would not be nearly so much if the fruit that has fallen since the rain could be saved. Owing to the poor drying weather preceding the storm, almost everybody's trays were in use and none are available to take care of the green fruit. D. A. Dunlap of Yountville has 5000 trays full of fruit and some fruit in the bins, but he says that at least 50 tons will be lost that have fallen since the rain. He is putting about 300 trays a day through his evaporator. As the fruit is dried, he will redip them and get them thoroughly dry before they go into the bins.

REDIPPING.

A year like this it is most important to do this. Dry well all now on the trays, then redip and dry thoroughly before putting in the bins. Look over the trays and pick out any stuff that is soft or undercured—also pick out all slabs. The greatest pains must be taken this year to send the fruit in right. In redipping, use about 1 pound of cooking soda to 20 gallons of water, adding a little lye or caustic soda as is seen necessary. Then dump them onto clean trays that have been scrubbed clean of mould or much labor will be lost. We suggest that, after scrubbing, the trays be sprayed with formaldehyde—1 pint to 25 gallons of water.

By the time this article appears it will be too late to make many suggestions, but the fruit must be kept moving. The sooner it is changed to other trays after it is firm enough to handle, the better. Fruit that has soured halfway through and that which has been mouldy and afterwards dried must be kept separate from the sound fruit. Otherwise it will all be placed in the second class.

The California Prune and Apricot Growers' Association recommends that four grades be maintained by the grower in his deliveries this year: 1, Prunes dried before the storm and in perfect condition; 2, prunes that are skin-damaged; 3, cracked prunes; 4, slabby prunes. The last three grades must be bone dry. It will necessitate quite a little hand picking, but there are many little hands that can assist in this light work.

COMPARISONS OF WET SEASONS.

We remember the season of 1904, when we had in Napa county 4.37 inches of rain between the 23d and 26th of September. But the season had been good for curing and what was left out was redipped and came out with practically no loss. In 1912 we had nearly 3 inches of rain on the 6th and 7th of September. It was early in the season and many prunes were cracked and many more never did sugar up well. Some were redipped along in the winter and much hand picking was done. This year of grace Napa averaged about 2½ inches of rain September 11 and 12. But the prunes were already in a delicate condition as to the skin because of the cloudy weather that had prevailed ever since picking began—not enough sun to toughen them up. Some prunes had been on the trays already for two weeks. These were stacked and safe, but it indicates the poor drying conditions. Now those people who are drying on alfalfa ground have to shift off or they never will get through, and the trays will have to be tilted off the ground till it gets dry or they will simply mould on the bottom and retard drying. The Government will probably require most of the sound fruit there is. Sour or moulded fruit will not be accepted for the use of our boys. It is up to our growers to go to any trouble and expense to have their fruit well handled this year, not only for their own sakes but for the honor of the industry. This can only be done by using cleaned trays to dump redipped fruit on and by careful hand picking.

Sheridan W. Baker of Santa Rosa reports a present loss for Sonoma county of 25 per cent. He says: "Of my personal fruit, we had half of it stacked and one-third is now in jeopardy. We are picking from the orchards direct onto the trays and have constructed a large vat into which we are dipping tray and all to save extra handling of fruit. We are dipping the prunes that have begun to sour in a solution of common baking soda, using 1 pound to 15 gallons of water, hot if possible. If not, we use cold water. While this fruit will not be first-class, if it has not soured clear to the pit it will have some food value."

SUGGESTIONS FOR SALVAGE.

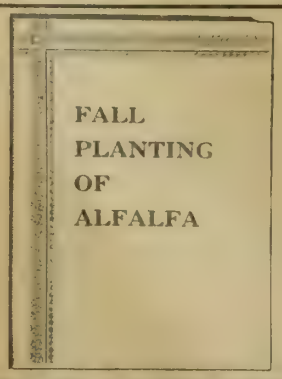
Ralph P. Merritt, California Food Administrator, has forwarded to Washington a plan to salvage the waste of the prune crop by converting it into denatured alcohol. In addition to the fermented portion of the fruit being utilized, the pits could also thus be saved for the Government. This use of fermented fruit is, we hear, always practised in Germany. The apples, plums or what-not are dumped into tanks to rot and about Christmas time the farmer begins to dip it out and distil it, there being no tax on the farmer on his private still.

The denatured alcohol from California's waste fruits may become a very valuable by-product.

SUGGESTIONS FOR PRUNING TREES.

If the very best pruners obtainable were sent around the country by the associations to prune, say 10 trees in different parts of each member's orchard, and keep the trees marked, it would help the industries. These object lessons would be especially beneficial now that we shall probably be dependent on untrained help, both male and female, in "carrying on" the fruit industry.

Helpful To Planters



This booklet is assisting hundreds of alfalfa planters to secure a better and longer-lived field of alfalfa. It is sent free on request.

Plant the kind of alfalfa that will yield heaviest and live longest under your own soil and moisture conditions.

There are seven kinds of Green Gold brand alfalfa seed. One will suit your conditions.

Write today for booklet describing different kinds of alfalfa and prices on new crop seed.

What Does It Mean

Ignition K-W High Tension MAGNETOS With IMPULSE STARTER

In reading over the specifications of the leading tractors, you will see under *Ignition* the phrase "K-W High Tension Magneto with Impulse Starter."

The Impulse Starter

What Does It Mean? To owners of these tractors, it means Sure and Easy Starting, regardless of the weather, how large the motor or how slow the engine is cranked. It means *No* Batteries, *No* Starting Coils, and *No* Complicated Self Starters. It means absolute protection against motor "kick-backs" while cranking even when the spark lever is left fully advanced.

What It Does! The K-W Impulse Starter holds back the shaft or rotor of the magneto until the firing point of one of the cylinders is reached. The shaft is then automatically released and is propelled forward (by means of a powerful spring) at a very high rate of speed—until it catches up to its former position. This produces a spark as large and hot as though the engine was running at full speed, thus insuring an explosion in the cylinder and a positive immediate start.

K-W High Tension MAGNETOS

not only insure the Easy and Quick starting of cold motors, but increase the power derived from the same amount of fuel, over that of any other ignition system. They permit the use of the cheaper grades of fuel and give "No Trouble" service.

Before You Buy a Tractor: Look up a neighbor who is using a K-W Magneto and talk it over with him. Then we know you will insist upon a K-W Magneto on *any* tractor you may decide to purchase.

Choosing the Variety of Wheat

[By W. W. Mackie, University of California.]

Many new wheat fields are to be planted in response to the request of the Government. In many instances the farmer has difficulty in selecting the variety best adapted to his soil and climate. A description of the characters of the available varieties and a definition of regions where each has been proved well adapted will assist the farmer in his choice.

The varieties which have proved their worth through the severe tests of California conditions include the following: White Australian (Bluestem), Little Club, Sonora, Defiance, Early Baart, Galgalas, Turkey Red, and Marquis.

White Australian, which is identical with Bluestem, is a medium early, fairly drought resistant, heavy yielding wheat. It is classed as hard white. Ordinarily it does not shatter, but under severe winds heavy losses may occur.

Sonora is noted for its drought resistance, earliness and heavy yields. It is well adapted to late planting, especially under irrigated conditions, but it is very susceptible to rust and wind shattering. It is classed as soft white and sells at the lowest price.

Little Club is a very heavy producer; stiff, short, erect straw, which does not lodge. The small, compact heads do not shatter even under severe wind storms. It is rust susceptible, medium early and is classed with Sonora in quality and price.

Defiance is noted for its rust resistance. Under rust attack it will give larger yields than any other bread wheat commonly grown. As it stools profusely and is very late, it should be planted early and seeded thinly. It is non-shattering. The quality is excellent and is classed as hard white.

Early Baart, a wheat new to California, is a heavy yielding, early bearded wheat of excellent milling quality. The kernel is long and white and is classed as hard white. It is subject to loss from shattering where heavy winds prevail. In such areas it is best to harvest when slightly green with a self-binder.

Galgalas is a heavy yielding, late wheat, somewhat resembling Sonora in red-colored, velvety head, but differing in its long white kernel of excellent quality. It is classed as hard white.

Turkey Red is a heavy yielding, bearded, drought resistant winter wheat. It is adapted to regions of snowfall. It is subject to lodging and shattering. It is classed as hard red winter.

Marquis is a new wheat which has given good results in several parts of the State. It is medium early, quite wind resistant, and somewhat rust and smut resistant. It is excellent in quality and classed as hard red spring.

Experience has shown that these wheats are adapted respectively to the following regions: Sonora to the San Joaquin Valley below Madera county, the dry west side below Newman, the dry valleys of San Luis Obispo county, and the Imperial Valley; Defiance to the cool, moist, rusty coast regions and elsewhere where long seasons, moisture and rust exist; Galgalas to the northeastern counties as spring wheat, Tulare Lake region and San Luis Obispo county; Early Baart wherever the soil is rich and moisture abundant; Marquis to the valleys of northeastern California as a spring wheat.

Charge For Tractor Work

[Written for Pacific Rural Press.]

To the Editor: I have a Samson S25 tractor, which is to be used in operating a bean thresher. The thresher is small, requiring about 12 horsepower and two horses to pull from place to place. What would be a fair price per day (about eight hours) for the engine—they to furnish engineer, distillate, oil, etc., but I would stand any repairs? I have been told that $7 per day would be a good price for that variety of work.—Subscriber.

[We surmise that unless you choose the engineer and know how he will treat the engine you might have to charge a rate that would cover nearly 100 per cent depreciation. Where you stand the repairs, there would be a tendency for the engine to be neglected. If your engineer conscienciously looks over the machine daily, replaces the oil when it gets dirty, keeps all nuts tight and all breakage or wear promptly repaired, you could then figure your daily depreciation on the probable life of the machine, adding this to interest on the investment and cost of insurance. Under these conditions both parties would be advantaged, because otherwise you would be paying the depreciation without return. The wear on your engine at that work, if well cared for, would not add much to the depreciation charge. Seven dollars per day would be a good price for that variety of work, considering the repair possibilities.]

Deep Plowing for Grain

[Written for Pacific Rural Press.]

There is a danger in deep plowing for grain, as observed by N. H. Fales of southern Monterey county. One of his neighbors has plowed deep for grain two years and has had smaller crops than those who plowed shallow. Mr. Fales plowed 30 acres as deep as possible on adobe ground with no plowsole, using horses, after rains came last winter, and made nothing from it. About 100 acres simply disked before the rains and harrowed after the rain made 60 tons of volunteer wild oat-wheat-barley hay. The disking was done to cover weed seed so they would sprout quickly when moistened. The principal reason for poor crops due to deep plowing just before seeding is that the subsurface soil is not pulverized and compacted. It has so many air spaces that moisture evaporates into them and gets away so the plant roots die for lack of moisture. The other objection is that deep plowing turns up chunks of plowsole and subsoil which do not have much available fertility until they have weathered a year. On the other hand, there are implements built to pulverize and compact subsurface soil and if there weren't the loss of one crop, with a full crop next year, is better than two half crops.

POWER NOTES.

The Yuba Mfg. Co. reported recently that it was behind 98 orders on its 20-35-horsepower tractors, but about even with orders on the 12-20. About 25 of the 40-70s have been built and sold.

Eighteen tons of Malaga grapes per load are to be hauled from Tulare to Kingsburg by Frank Gianini with a five-ton Fageol motor truck and two five-ton trailers. Mr. Gianini has been hauling peaches and other farm products by truck for his tenants.

Kings county last year produced 5110 tons of dried peaches and shipped about an equal weight green to the East. Armona is the fruit center, the southern part of the county being alfalfa, pasture, grain and summer crops only.

The Ventura County Fair will be held in Ventura, October 2, 3, 4 and 5. Plans have been completed whereby Santa Barbara county may

Lima Market and Crop Prospects

[Written for Pacific Rural Press by R. E. Hodges.]

Lima bean shipping in a large way began about the middle of September this year, the season being later than usual. A limited quantity were sold by the California Lima Bean Growers' Association at 12¼c for immediate shipment, according to Manager R. L. Churchill, and the first larger offering at 12c for October-November delivery has been taken in a satisfactory way. The policy of the association is to sell at whatever price current conditions justify, so later quotations may be either higher or lower, according to the course of events. Mr. Churchill, however, believes that the tendency will be upward. California limas have been practically cleaned up in all markets. The association sold the last of its holdings in July, and Mr. Churchill estimated that not over ten carloads remained in California September 1. At a recent meeting in Oxnard, H. Clay Miller of the Food Administration told the growers that Government requirements and prices had not been set, but that England, which last year imported quantities of Madagascar limas, will depend more on California this season on account of ship scarcity. The Government and allies last year took about 3,000,000 pounds of California limas. Mr. Miller felt confident that they would take more of all varieties this year.

Directors of the association recently estimated that in nearly every one of the lima producing counties there is increased acreage, but due to about 85 per cent of last year's yield per acre on the land that produced limas last year, the total crop may be even less than that of last year. A hot wave early in August materially decreased the prospective yield, while wireworms, aphis, and corn-ear worms did considerable damage. Corn-ear worms are new pests on lima beans, but considerable areas were damaged by them. Sprays frequently killed the vines and thus inconvenienced the worms, but no satisfactory way of preventing the worms has been worked out. They are hard to reach with anything after the vines mat.

Wireworms, especially in Orange county, cleaned up considerable patches. They worked on the roots as much as a month after the beans were up. Considerable acreage here that ordinarily would have gone into beets was planted to beans this year and on much of this the crop is poor, though a beet and bean rotation is quite commonly practiced. In Santa Barbara county and parts of Ventura over-luxuriant growth of vines caused the blossoms to set poorly and in some cases a second crop has set so late that it may not mature. Meanwhile the big threshers are at work on fields already cut. Rain did not hurt the crop materially, though the writer saw some fields in Los Angeles county where a large per cent of pods in the piles had bursted since the sun dried them off.

THE ASSOCIATION.

The California Lima Bean Growers' Association expects to handle about 40 per cent of the crop this year, which is nearly double its tonnage of last year. The membership is more than double what it was last year. The association is for the first time marketing other varieties grown by its members. Bags and twine bought wholesale for members last year saved them about $30,000 over current prices. This is the only venture aside from marketing the crop.

Glenn Co. Fair Makes Excellent Showing

[Written for Pacific Rural Press.]

Glenn county held its second annual fair at Orland last week and it was a big success. While war conditions worked adversely in some ways, they helped in others. Wonderful music by a band from the Naval Training School at Mare Island and acrobatic stunts by an aviator—who made the trip from Mather Field—were two features that attracted the crowd and swelled the gate receipts so that expenses were covered as early as the middle of the week and the financial success of the fair assured. While last year's fair set a pace hard to beat, we believe that every department showed an improvement this year. The Farm Bureau, school and industrial exhibits were housed in two large tents and commanded interested attention. Most of the leading tractors and implements were shown and demonstrated in a field adjoining the fair grounds.

THE LIVESTOCK EXHIBITS.

The livestock show was much more complete than last year, in the number of breeds and the quality shown. Of dairy cattle the Jerseys were in the majority. The exhibitors were: S. F. Williams, Dr. H. W. Hand, W. G. Gurnett, A. K. & Nellie Morey, M. Forlini, Guy Baugher, N. S. Nelson, J. E. Grout, John Harriger, Arthur Gearhart, Arthur Erickson and John Button of Orland; N. H. Locke Co. and J. E. Thorpe of Lockeford. The awards were well distributed by the judge, Prof. Ruble. S. F. Williams' Golden Maidekins Boy was made grand champion bull and N. H. Locke's Borello's Golden Laddie reserve grand champion. J. E. Thorpe's Salome was made grand champion cow and Dr. H. W. Hand won the junior championship.

The Holstein exhibitors were: J. S. Gibson Co. of Williams and J. Salvagne of Orland. The latter was awarded reserve senior champion and first prize two-year-old bull, the other awards going to Gibson Co.

Berkshire swine were exhibited by W. F. Sandercock, Anchorage Farm and Superior California Land Co. The Anchorage Farm was awarded first prize for best herd bred by exhibitor, boar one year to eighteen months, boar six to 12 months and boar under six months. The other firsts and championships were awarded to W. F. Sandercock.

Duroc-Jerseys were exhibited by W. T. Hollingshead & Sons and Adam Lachenmyer of Orland and J. E. Thorpe of Lockeford. Hollingshead & Sons were awarded the junior champion boar and first under six months boar. Lachenmyer first boar under eighteen months and first sow with litter; other firsts and championships to Thorpe.

The Poland-China awards were hotly contested by R. J. Yates of Orland and J. H. Cook of Paradise. Yates won grand and senior champion sow and boar, Cook won junior champion sow and boar. Yates won six firsts, Cook three, and Frank Reiman of Orland two. All Chester White awards to Dewey Huffman.

Sheep were exhibited by Burroughs Ranch and Alfred Kuhn of Orland, A. H. McInnes and Ellenwood & Ramsey of Red Bluff. The Butte City Ranch had a good exhibit of Shetland ponies. There were also exhibits of horses and Polled Durham cattle.

The poultry, pigeon and rabbit show was made up largely by local breeders and was good, in both quantity and quality.

EARLY BAART WHEAT.

Early Baart wheat is coming into surprising popularity in various parts of the State. Several farmers in Placer county tried it last year. One of them plowed about Christmas a year previous. He replowed after the rains, leaving it rough all summer and planting last fall before the rains on red land a little better than the average. He called the piece six acres and said he got 15 sacks per acre. It was cut right after oats were harvested, between early and late wheat. He likes it best of all varieties.

Order Germain's

HAIRY PERUVIAN Alfalfa Seed NOW!

BUY PROVEN TESTED PEDIGREED SEED!

LIMITED SUPPLY + INCREASED DEMAND

ORDERS FOR 20 TONS UNFILLED LAST YEAR

BUY FROM THE INTRODUCER

BUY THE GENUINE "Germains"

Orders for Germain's Hairy Peruvian Alfalfa seed are pouring in. Owing to the small amount of seed raised last season the supply of the genuine, true-to-type Germain strain is extremely limited, and those who intend to plant and who fail to place orders at once, may be unable to obtain seed later on. Last season we were compelled to disappoint hundreds of patrons—and this season promises even greater disappointments.

Remember—we urge you to buy at once—no matter if you do not intend to plant until next spring, buy your seed NOW!

Results obtained by practical ranchers show an average of 2½ tons more alfalfa hay per acre with Germain's Genuine Hairy Peruvian Alfalfa than with the ordinary types.

Special folder upon request.

Inoculate your seed with FARMOGERM and get bigger and better crops. Farmogerm-treated seeds mature earlier and produce larger and better crops than untreated seeds.

Germain Established 1871 Seed & Plant Co. N.E. Corner Sixth & Main Sts. Opp. P.E. Depot Los Angeles, Cal.

Please mention this magazine when you write.

CAUTION—For your protection, Germain's Hairy Peruvian Alfalfa is sold only in sealed and stenciled bags.

HARDSHIPS OF BARLEY GROWERS.

To the Editor: Your article on "The Future of Barley" was interesting. We are just now interested in the present price of barley. At this years' seed time we were officially implored to raise barley so as to save wheat for war export. At that time there were three uses for our barley: milling, malting and stock feed. In the midst of our harvest malting was officially limited and finally practically forbidden. We tried to cheer up on milling and stock feed, for the official regulations required 50 per cent of barley flour in bread. Just as we finished harvest, having paid from $7 to $12.50 per day for harvest hands, official wisdom changed the bread regulation to require only 20 per cent of barley in our daily bread. This consumes so little of our crop as to be negligible in its effect upon prices, and we are left with the most expensive crop ever raised anywhere, with no market, required to pay storage and insurance and to borrow money to pay the season's expenses.

Let us be pious or impious, as may happen, and say that we farmers are the victims of substituting official regulation for the laws of God. At a meeting of these substitutes for God, recently held in Washington, it was decided to so fix markets and prices as to let the farmers "break even." It is expected, of course, that Providence will provide us the means to plant the next crop.

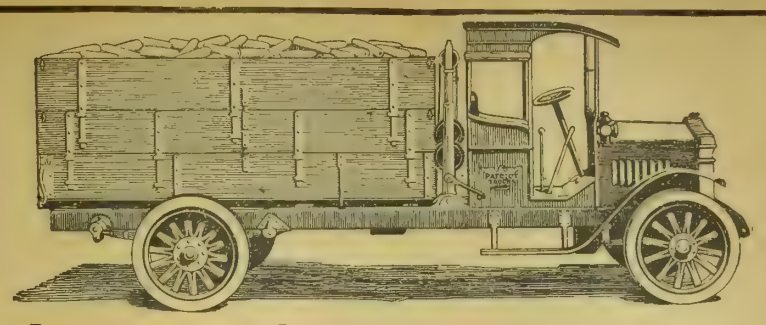
Over every crop in this State is the shadow of labor shortage. On my ranch is a potato patch of 300 acres. From the beginning of the season, to continue until the crop is dug, this has required twenty Chinese farm laborers, paid $75 per month and board—which at the present price of rice amounts to $100 per month per man. Potatoes, beans and onions must be hoed, and only Chinese and Japanese will touch a hoe handle. Official authority and the scholastic prowess of the university have piffled through the season, solving the farm labor problem with a survey and a card index, while the shortage grows and the official cry for more production gets louder—and common sense seems to be outlawed.—Jno. P. Irish, Oakland.

FOUR-ROW BEET DIGGER.

[Written for Pacific Rural Press.]

Digging sugar beets has been a more or less unsatisfactory job with horses and beet "pullers." The tail of a beet contains a higher percentage of sugar than the body of it, but the pullers leave a great many tails in the ground. They require four horses to pull one row at a time and the horses must rest a great deal. It was our privilege recently to watch the operation of a four-row Killefer beet digger on the Springville Ranch of the American Beet Sugar Co. in Ventura county. It was pulled by a 75-horsepower Caterpillar. One man, Ellis Lund, operated the engine, and one man, Morton Brezee, operated the digger. According to these gentlemen, they would dig ten or twelve acres a day with the cutting wings running fourteen or eighteen inches deep in the silt adobe. The cutting wings are ¾-inch steel plates about eight inches wide and 18 inches long, fixed so they project diagonally backward on each side of each of two subsoiler points. They give the ground a perfect subsoiling, for they cut every inch of it. They lift the ground about six inches, leaving the beets entirely loose, unbruised, and with long tails. The operator rides the machine and turns a hand wheel to raise or lower the cutters.

The beet rows are 18 inches apart. The tractor tracks are 12 inches wide and 72 inches apart from center to center. They do not bruise the beets except where the rows run together in poor planting. To make good turning at the ends, about 24 rows are skipped at each turn so the outfit never has to travel across the end of an entire field.



Increasing the Value of the Farm by Bringing it Miles Nearer the Market

The value of a farm depends largely upon its distance from a good market.

Today distance is measured in minutes, not in miles.

The Patriot Farm Truck (Lincoln Model, 1½ tons capacity) readily transports much more in weight with several times the speed of a horse-drawn wagon. It lays down at market 15,000 to 20,000 pounds in practically the same time that a team will deliver 5,000 pounds, literally bringing the farm to about one-fourth its actual distance from market.

PATRIOT FARM TRUCK

Built for Country Roads—Built for Country Loads

The Patriot is the first motor truck built for farm work, and is equipped with a practical farm body, similar to what you have always used on your farm wagon.

It saves horses and high-priced feed. It brings better markets nearer, for with a Patriot you can readily drive loads to a market fifty or one hundred miles distant.

Business farmers can easily see how such perfect transportation greatly increases the value of their farms, to say nothing of the convenience in being master of roads and weather.

Every farmer with 160 acres or more should find out what a Patriot Farm Truck will save. Write for information.

Walnut Crop and Market Prospects Bright

[Written for Pacific Rural Press.]

California will have a 4 per cent larger walnut crop than last year, which was the largest ever, if unfavorable conditions such as sunburn, rain, or labor shortage at harvest do not change the prospects; and it now looks like the yield will be 32,000,000 pounds, according to Carlyle Thorpe, manager of the California Walnut Growers' Association. The sizes seem likely to be about normal and the quality unusually fine. Last year the sizes were rather small and No. 2s comprised about 42 per cent of the total; while this year they will be only about 4 per cent. As about 80 per cent of the plantings for the past ten years have been of Budded varieties, which withstood the 1917 hot spell better than the Softshells, the crop of the latter is likely to be less this year, considerable fruit wood having been killed in 1917, while the Budded nuts are increasing annually. Growing conditions have been fine and the trees are in better condition than for years. The crop is maturing uniformly and the harvest will take less time, finishing about as usual, though it will probably start ten days later than last year.

Market prospects are unusually bright. The demand is keen, though association opening prices will not be announced until October 1.

Mr. Thorpe has just returned from the East. The War Trade Board has prohibited importation of all Oriental nuts on account largely of need of shipping for other commodities. About 5,000,000 pounds of "Manchurian" walnuts have been imported annually in previous years. The French have an embargo on all nuts in the shell, but this embargo cannot be depended upon. France is the largest producer in the world and our principal competitor. She has a normal crop. There is no holdover in France or America. Italy and Spain have good crops and a large part of these will probably get to the United States. At all events, California must be depended on largely for the holiday trade, which in this country is normally around 45,000,000 pounds.

The association now has 2400 members, as against about 2100 at this time last year, and it controls about 75 per cent of the crop. Supplies for the growers who are members of the association were ordered early and have practically all been delivered, so members are safe in that line. Owing to the high price of burlap, about half of the nuts will be shipped in saxolin bags. These are made of strong paper, open weave, being more attractive because they show the nuts through the weave. As they do not stand much wetting, about half the crop will be shipped in the usual burlap bags.

Scramble for Tomato Crop

[Written for Pacific Rural Press.]

Tomato shipments from California have been light and will continue light all fall, for reasons cited by H. H. Warner of the U. S. Bureau of Markets, with headquarters at Los Angeles. In previous years canners had contracted acreage with the verbal understanding that growers might ship whatever green tomatoes they desired. Owing partly to the effort before planting time to fix a maximum price of $15 per ton to the growers, tomato acreage was reduced in California. When shippers went out as usual to buy for their purposes, the canners pointed to their contracts and had the shippers called before the Food Administration for violating the rule which prohibits solicitation of produce which is already under contract. The Government has requisitioned about one-third of the canned output and canners are holding strictly to their contracts, fearing that otherwise they will be unable to supply the demand. Shippers are therefore having great difficulty getting enough tomatoes to supply their needs. Unofficial estimates of the acreage in Southern California are as follows: Los Angeles county, 8800 acres; Orange, 1700; Riverside, 1300; Ventura, 1200; and San Diego, 1050. Two or three years ago, when we had early fall rains, late blight practically wiped out the crop in Orange county in two or three weeks. It is probable that the recent rain has resulted in rot and perhaps blight, though reports are not in. Summer blight has been particularly bad in San Gabriel Valley, Los Angeles county, and in the Escondido district of San Diego county. Nematodes have been bad in Ventura and Orange counties and the Chino district of San Bernardino county. Mosaic disease has been prevalent in nearly all fields, but has done only slight damage. Notwithstanding these troubles, R. G. Risser of the Bureau of Crop Estimates, whose acreage figures are given above, estimated September 11 before the rain that the yield per acre should exceed that of last year if we get no early frost like that of last mid-October.

Most of California tomatoes shipped out of the State are now going to Texas and Oklahoma, but will go north even as far as Chicago when frost kills the northern crops.

Household Method of Making Grape Syrup

[Written for Pacific Rural Press.]

The following simple method for making syrup from grapes is much used in Southern Italy and can be employed in California just as well. This syrup can be made in any kitchen and is suitable to be used with hot cakes, cooking and other purposes for which corn syrups are used. It is much superior to most of the syrups at present on the market.

The grapes are stemmed, crushed and then heated to nearly the boiling point for a few minutes. The juice is then strained off, through a muslin bag in the usual way, and placed in a wide shallow pan on the stove. Egg shells are put in with the juice to neutralize certain of the acids—say about a dozen egg shells to the gallon of juice. Or prepared chalk (from the drug store) may be used instead of the egg shells—about 1½ to 2 ounces to the gallon.

The juice is then kept boiling slowly until it thickens to a syrup of the desired consistency. It is then again strained through a bag and kept in jars, bottles or cans for use. Prof. Fred T. Bioletti, to whom we are indebted for these notes, is preparing a bulletin to be published shortly by the Agricultural College at Berkeley, in which is to be set forth suggestions based on recent experiments for utilizing a limitless tonnage of grapes on a commercial scale.

LEMON MARKET SLOW.

Lemon prices for the past month or more have been shot to pieces. Eastern weather has been cold during that time and probably the sugar rationing has had an effect. Heavy arrivals of late cargoes of foreign lemons at New York have also depressed prices on account of their poor quality. An entire cargo of 45,000 boxes, which had been in transit since June 1, has been abandoned by the importers because of its bad condition. Another cargo of 26,000 boxes arrived in bad condition due to a fire at sea. The pickings of California lemons are heavier than usual at this time of year, but the quality is very fine. There has been no more decay in transit than usual.

participate, and Friday, October 4, has been fixed as Santa Barbara Day at the show. Agriculturists and fruit growers of the two counties will compete individually instead of by counties, which will tend to promote a friendly rivalry that is very desirable in adjacent counties.

A SENSATION AT THE RECENT LOS ANGELES DEMONSTRATION

18-36 STINSON TRACTOR

THE STINSON TRACTOR has a greater per cent of reserve power beyond its rating than any other tractor on the market. It transmits its drawbar power through spur gears only, and not through bevel gears. All gears on the Stinson are enclosed in a dust-proof housing and operate in a bath of oil.

There is positively no side draft on the Stinson, the pull being direct from the center of frame. The Stinson Tractor is equipped with the stinson-Beaver motor with a 4¾-inch bore and 6-inch stroke.

Field and Garden Suggestions

[Written for Pacific Rural Press.]

Deep Dry Plowing Paid Well.

Dry, early, deep disk plowing made a good crop of barley for A. O. Crawford of Yolo county last season, while plowing after the rain yielded grain which paid less than it cost and some of which did not get out of the boot. Mr. Crawford first plowed about 30 acres with a moldboard. That forced him to either get below the plowpan and turn up big chunks or slide along on top of the plowpan, as had been done previously. He got a disk plow and ran it eight to twelve inches deep on about 300 acres, cutting almost but generally not quite through the plowpan, so the rains penetrated it and met moisture from below. Barley was springtoothed into both lots after the rain, but the dividing line was noticeably better all season where the disk plow worked. The yield averaged 19 sacks per acre of grain weighing 103 to 108 pounds per sack. Sixty or seventy acres plowed with the disk plow after the rain and only about six inches deep scarcely paid for the harvesting. It took a 60-horsepower tractor to pull 60 inches of plows, but it paid.

Fig Growers to Hold Institute.

An institute for fig growers is to be arranged for Merced orchardists next month, under auspices of the Merced Colony Farm Center, with County Horticultural Commissioner A. E. Beers directing the program. Similar institutes are to be held in Madera and Fresno near the same time. each being for two days. It is planned to have the leading fig growers and experts of the State address the meetings. Professor Ira Condit of the University of California will be among the speakers. The question of soil fertilization for figs will be dealt with at length.

Grain Growers' Meeting.

The California Grain Growers' meeting at Sacramento, September 7, discussed two systems of organization, one a capital stock project, the other purely co-operative and without capital stock. Sentiment favored the latter, but no conclusion was drawn; and a new committee on permanent organization was appointed by nomination. The new committee is composed of Edgar Hunter, Willows; W. Q. Wright, representing San Joaquin county; O. E. Lambert of Modesto; T. A. Kilkenney, Dixon; and Jesse Poundstone, Grimes.

Fair Oaks Buys Irrigation Lines.

Fair Oaks, Sacramento county, and a part of Citrus Heights, are included in the 4000-acre district which recently voted $200,000 bonds to buy the irrigation pipe lines now used there and to distribute the water as a district. The Railroad Commission has valued the pipe lines at $62,500, and the Fair Oaks Water Co., which now owns them, has agreed to accept bonds to that amount as payment. Water will be bought from the North Ditch Water Co. Not over $100,000 is to be spent while war conditions last.

Large Moldboards for Alfalfa Plowing.

At least a 14-inch moldboard plow is needed in plowing out alfalfa, according to John Sprandel of Tehama county. The big plow does not shove roots ahead like smaller plows, but cuts them better. Its big landside holds it more firmly in the line it should follow. Steel shares or regular alfalfa shares are best because they keep a good cutting edge which does not wear smooth and shove the roots ahead. A disk plow is not satisfactory for alfalfa because the roots shove it aside.

Shock Poor Corn Green.

On many farms we see corn which has produced only nubbins or no grain at all being left to dry up while the farmers are hollering about the cost of hay. They are losing half or more of the feed value of that corn because they do not shock it while it is green. Save the leaves and small ends of stalks in attractive form and the livestock will cost less.

Four-Row Bean Cutter.

A 20-sack lima bean crop mixed luxuriantly with morning glory vines was being cut four rows at a time recently while all the vines were still green on the Hugo McCraw ranch, in Ventura county. It took seven heavy horses to pull the cutter, which is a sled with long knives spreading backward from each side of each runner.

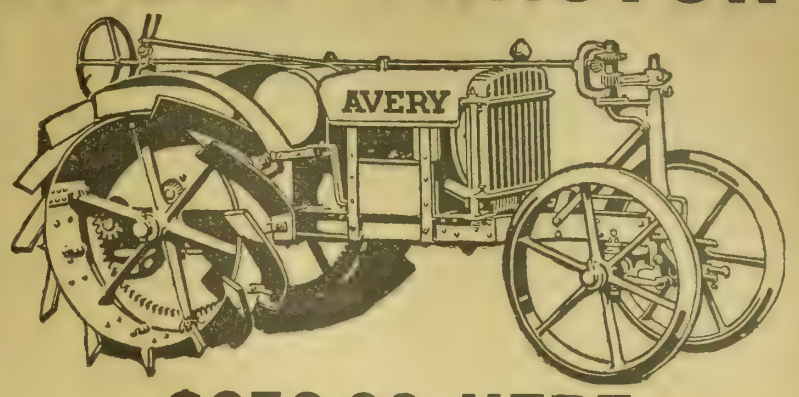
Cabbage, Cauliflower, Kale.

It is time to plant cabbage, cauliflower and kale for winter growth, and those who have not already planted seed may well buy plants. Too late planting or too warm weather frequently results in headless cabbage.

KILLING WILLOWS.

To the Editor: It may help N. B. W. of Thalheim to know that he can kill willows by cutting so as to leave a stump a foot high, then let cattle browse the shoots for two summers. I have done this for ten years and have never seen it fail.—C. F. W., Tancred.

AVERY TRACTOR



$650.00 HERE

¶ The Avery costs you less to buy—less than any other tractor of equal horse power—it does not require an experienced engineer to run, and you cannot duplicate its power in horses or mules for less than twice its cost.

The Avery Ends Farm Slavery

¶ Let us explain why.

F. H. POSS COMPANY
California Distributors
67-69 Beale Street SAN FRANCISCO

TEN (OF MANY) CASE Betterments

1 Weighs only 3400 pounds, little more than a team of horses. Low and compact with short wheelbase. Turns in 22 ft. circle. Stays on all fours.

2 Rated 10 H. P. on drawbar, but develops nearly 14 H. P. Rated 18 H. P. on the belt but delivers about 24 H. P. This insures abundant reserve power.

3 Four cylinder Case valve-in-head motor. Removable head. Motor is set crosswise on frame, affording use of all straight spur gears. This conserves power.

4 Belt pulley mounted on the engine crank shaft. No gears used to drive it. Pulley is part of the tractor, not an extra-cost accessory.

5 All traction gears are cut steel, enclosed and running in oil. No bevel gears, chain, worm or friction drive parts.

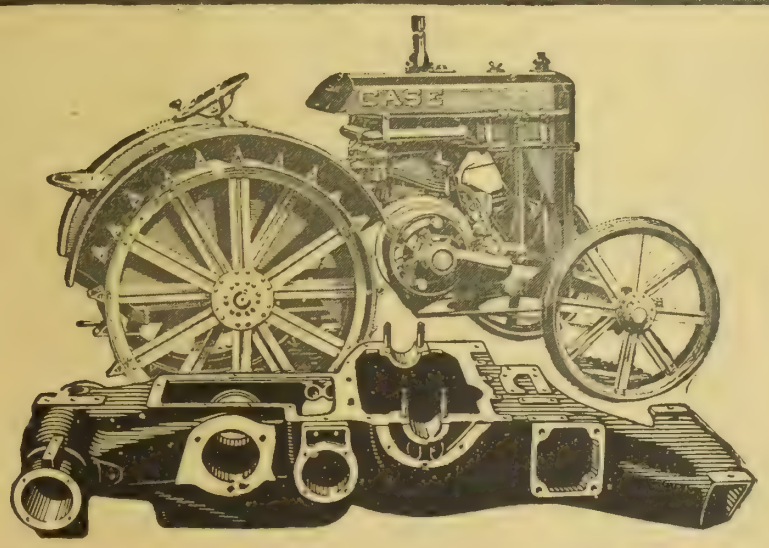
6 Case-Sylphon Thermostat controls cooling system and insures complete combustion of kerosene in the motor. Prevents raw fuel from passing by pistons and diluting oil in the crank case.

7 Case air washer delivers clean air to carburetor. No grit nor dust gets into cylinders to minimize their efficiency and shorten their life.

8 All interior motor parts lubricated by a combination pump and splash system. Speed governor, fan drive and magneto are dust proof and well oiled.

9 Complete accessibility. No dismantling necessary. Removable covers permit you to get at parts quickly.

10 Hyatt Roller Bearings in rear axle, bull pinion shaft and transmission case. Kingston ignition and carburetor. Five-piece radiator with a cast frame. Core is copper. Fin and tube non-clogging type.



This One-Piece Main Frame
Reduces Vibration—Prevents Disalignment

Here we picture a new tractor achievement—the frame of a Case 10-18. It is the fore-runner of new-day ideas in designing.

Note that this casting constitutes a dust-proof housing for the rear axle, bull pinion shaft, transmission shafts and the bearings for these parts. It also provides a base for the motor, which sets **cross-wise.**

This type of frame construction brings rigidity unattainable in a fabricated frame. It insures constant alignment of bearings, shafts and gears. Owners avoid gear troubles. Thus we prevent power losses.

And we multiply strength while reducing weight.

This one-piece frame is one of the greatest advancements in tractor history. It was inevitable. Others are bound to follow. But Case is in the lead. Case offers you **now, today,** what later on will be adopted generally.

This is only one of many betterments, some of which are itemized at the left. Do you know of any tractor offering all these superiorities?

A complete description of the Case 10-18, with illustrations and specifications, will be mailed upon request. Write for it today. Or visit a Case dealer.

CASE KEROSENE TRACTORS (781)

Greatest Tractor Demonstration in West

(Continued from first page.)

An awe-inspiring spectacle it was each afternoon to see forty-five tractors, each of different model from all the rest, turning over 30 acres an hour of fiercely resistant, hard adobe. Three or four other kinds of soil as bad or worse at various parts of the furrows served to keep the plowmen guessing and showed not only the best operators but also the best plows for such conditions. Tractors having a total of 634 rated drawbar horsepower pulled plows built to cut 1390 inches wide each time across the field in the daily afternoon collective demonstrations, which were designed to give the best possible opportunity to compare their pulling power at the job where steel operated by fire is most needed. In the individual demonstrations, which occupied the rest of each day on large plots of ground assigned to exhibitors for the purpose, about 100 tractors of 52 models performed at the request and for the inspection of visitors who crowded around them and asked pointed questions.

Practically all the modern implements for preparation of seedbeds were hauled about by the tractors until in places those great adobe or cement clay chunks were reduced to dry dust shoetop deep. Great subsoilers tore gashes in the flinty earth so deep that the 20-inch mark on a yardstick would go out of sight in them. One tractor cultivated 45 feet of adobe clods at a trip. The smallest tractor had a drive wheel not over a foot in diameter and generated less than a horsepower on the drawbar. Tractors were turned loose running backward and forward in circles. One was run onto a block two feet square, being left with one drive wheel cocked up that way without straining the frame and afterward being backed off and driven off forward as gently as you would lay your hand on a sick friend. Another pushed a four-row bean cutter ahead of it through soft soil. Another operated a feed and forage grinder for alfalfa, bean straw, and all kinds of grain. One operated a hay press. Another pulled an orchard irrigation checker which itself closed the gaps made in crossing borders at right angles. A tractor operated a mammoth ditch digger working on a new but very effective principle. A revolving apron studded with sharp, heavy teeth dug into the earth on the level at any depth desired, cutting under the surface as it was pulled forward and caving or tearing the top dirt downard with great speed and minimum power per thousand yards of earth handled. Tillage implements of every kind useful in California, representing the best and latest devices for saving labor, were exhibited and explained in the tents.

DEMONSTRATION ARRANGEMENTS.

The weather was perfect. The attendance was fine and energetically interested. The management of the demonstration went forward without a hitch. Agricultural implements and tractors were individually exhibited and demonstrated in acres of tents and on other acres beside them. The individual demonstration grounds were laid out along driveways not much, if any, less than a full mile long. Each exhibitor was allotted space according to the number and horsepower of the tractors and implements he wanted to show. Each one had chairs, tables, and drinking water in his tent for free use of visitors. On these individual demonstration grounds stunts were performed and a variety of implements used at the pleasure of the exhibitor and of the farmers who were there. Perfect seedbeds covered by real dust mulches were worked up on most of the plots before the end.

In the daily afternoon collective demonstrations of plowing, fields approximately 30 or 35 acres were laid off in plots 500 feet long and varying in width according to what each dealer thought his machine could plow in an hour. It is noteworthy that the allotments varied from a width of five feet per drawbar horsepower down to one and a half feet. This partly explains why some tractors finished their lands long before others did. It also indicates the unsettled condition of horsepower ratings of tractors.

WORK PER HORSEPOWER VARIED.

As a further indication of wide variation in the horsepower rating with respect to actual power applied to the implements, it is curious to note that the plow width pulled by the various machines varied from 1 1/5 inches width per rated drawbar horsepower to 3 1/3 inches. This is not a full criterion, however, for the depth of plowing varied enormously, and the tractor which drew one of the narrowest plows went deepest most consistently of all. Another of the exhibitors, whose work was more extensive than most of the others, went consistently uniformly deep and finished up the most beautiful plowing of all because of the size and uniformity of the job, pulling 2 4/5 inches per rated drawbar horsepower. Most of the tractors pulled over two inches per drawbar horsepower and the average of all was close to 2 1/5 inches. Inches of plow width per motor horsepower varied from 0.6 to 2.0, and it is curious that the difference in inches plow width per horsepower between the rated drawbar horsepower and the motor horsepower varied as widely, showing but little real relation between the motor and drawbar horsepower ratings. If the other ratings had been precisely proportional to the plow width actually pulled, we might figure that the variation between motor and drawbar horsepower really represented greater mechanical efficiency of some tractors over others. Such greater efficiency undoubtedly exists, but the commercial ratings are poor guides to it. A recognized national system of rating motor horsepower is much needed along with authoritative dynamometer test records. The farmer who would choose the tractor which delivers most of its horsepower at the drawbar must watch and compare closely the actual sustained unlabored pull of various motors of similar sized bore and stroke. Herein lies a great value of a working demonstration as the one held at Los Angeles, if the work of suitable sized motors was carefully compared. It was remarkable that while a considerable number of the tractors pulled an overload they almost uniformly had power to slip their tracks and drivewheels before the motor stuck. This is as it should be, to avoid the greatest motor strain.

OTHER FEATURES TO LOOK FOR.

Mechanical efficiency, however, does not vary widely enough to repay a food producer's delaying the purchase of a tractor until he can study it out scientifically. More important points than this are dustproof bearings and accessible parts. If the engine is so built that various wearing parts are not easily accessible, they are almost certain not to receive proper frequent attention and troubles become numerous. If bearings are exposed to the possibility of California dust getting into them, they are sure to grind out as you would grind valves, only faster. Be it said that very few tractors on our Western market have exposed bearings. This problem has engaged most careful attention from designers of tractors.

Steering ability is an important feature in which great variation was noticed, not only in the end turns but in riding the huge clods that fell into the furrows. Even most of the tractors which run their steering wheels in the furrow were with difficulty kept in line. Turns at the end of the furrow are of far less importance; for even in orchard and vineyard work the turns need not be so short as people generally think. Comparison of these and other vital points was most easily and surely made at the demonstration, where so many machines

Nilson Lever Hitch TRACTORS

NILSONS are the tractors which are light in weight, but which, because they are built principally of Steel, are also dependable and durable. They combine strength and big traction with light weight and fuel economy to a wonderful degree.

The Nilson Patented Lever Hitch insures good "Grip" or Traction under all conditions. Three Drive Wheels keyed to the axle form a **Wide Drum Drive.** This keeps the tractor **on top** of loose ground and prevents packing of the soil.

In every detail Nilson Tractors set a high standard of mechanical perfection. They are equipped with the famous Waukesha 4-cylinder Tractor Motor and Hyatt Heavy Duty Roller Bearings. The transmission gears are of especially case-hardened steel, machine cut, and are enclosed and run in oil. This means a great deal in increasing the life of the tractor. All working parts are enclosed against dust and grit. The motor is equipped with the famous Bennett Carburetor Air Cleaner. In building Nilson Tractors everything has been done to make them long lived and reliable so that every Nilson buyer may receive the greatest value for his money.

Built for California Conditions

Nilsons have made good in California.

American Fruit Distributors, Brawley (Imperial Valley), Cal., have used a Nilson Junior, discing 50 acres per day of 12 hours, using 18 gallons distillate and 2 quarts lubricating oil. They have purchased their second Junior.

J. M. Warner, Turlock, Cal., has used a Nilson Senior this season to plow and disc 300 acres of river bottom land, pulling four 14-inch plow bottoms, and later operated a 26x46 grain thresher during the entire threshing season.

It will pay you to investigate Nilson Lever Hitch Tractors. Write or wire us.

Distributors, with Repairs and Service, at Los Angeles and Stockton.

NILSON TRACTOR COMPANY

worked under practically similar conditions.

OBSERVATIONS ON PLOWING.

Tractors in a demonstration cannot help but be judged even by the fairest minds partly by the finished job of plowing. Farmers, of course, saw that much of the poor plowing was not the fault of the tractors nor necessarily the fault of the plows. It was notoriously apparent that many of the men in charge of the plows were incompetent to handle them in the particular soils of the demonstration fields. Under such management the best and most suitable of plows would make a poor showing, both for themselves and for the tractors that pulled them. On the other hand, due to the hardness of the soil and the desire of tractor men to make a showing, many of the tractors had too much plow width in proportion to their power. The soil generally was such that plows must go deeper than the six inches required by the rules of the demonstration, in order to stay in the ground properly and do a good job. With the deep plowing thus required, many of the tractor drivers realized their inability to pull the plows, so they set them at lesser depths and let them ride on their points either in an ineffectual effort to get them deeper or in an effort to make the public think the plows would not go in and that therefore the tractors were not to blame for the shallow, bum plowing. One tractor was noticed, however, which on the first day tried to pull two tens and made a miserable job. Its operators were wise enough to pull one 14-inch plow the following days and do a thorough job of it. In this case, even the 14-inch plow proved altogether too much for the traction possessed by the tractor. Less width of plows and greater depth would have been far more creditable for many tractors. There was a large number of two-gang 10-inch moldboard plows which were never designed for the class of work they tried to do on this field, and the result was unfavorable to the whole demonstration. Clods as big as small wash tubs were commonly turned up and tractors were frequently stopped to knock such clods from under the plow beans, where they had clogged the whole works. Larger plows were not so badly afflicted this way. The smaller plows were scarcely strong enough to go deep enough in this soil to make the finished job look right. Even some of the bigger plows were broken and their beams straightened out. Where disk plows could be held in line, they did the best plowing of all because they did not throw up such big clods. Here, as with the moldboards, good plowing seemed more a matter of proper adjustment than even of weight or strength. It was noticeable that in the length of some furrows about three different kinds of soil required three different adjustments to make them go the same depth. Many of the plows did not get the required adjustments.

FREE TRACTOR LECTURES.

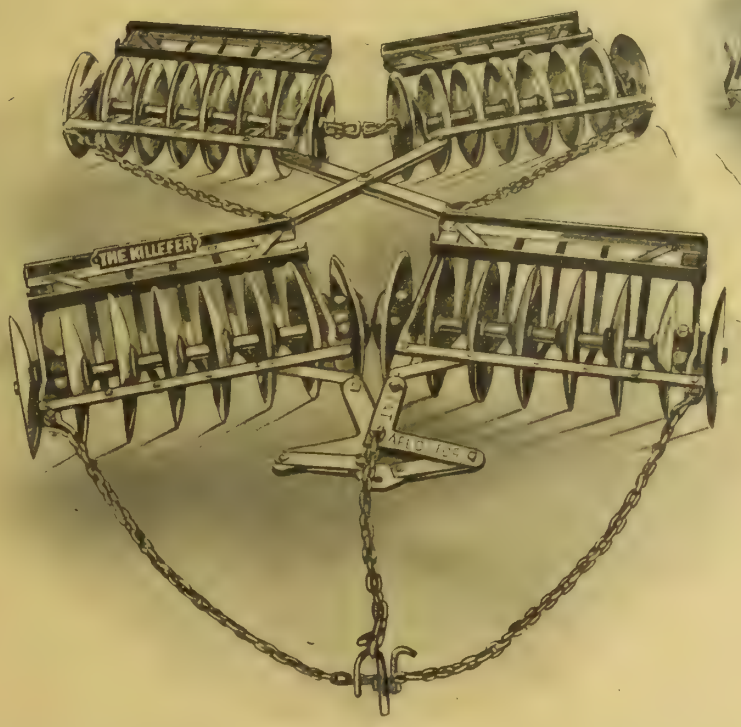
It is useless to tell a man that he can or will run a machine without knowing its inner workings and what takes place when he moves a lever, pulls a wire, or makes an adjustment. It is useless to tell him what will follow certain adjustments unless he knows why and how that result follows. It is useless to tell a man all about how and when to lubricate various parts of the machine unless he is made to understand why and how disastrous results follow lack of attention. If he doesn't know the inside of the machine, he will not adjust or lubricate or protect it properly, and early grief comes with its attendant advertisement of the supposed imperfections of the machine. It was to enable tractor owners and drivers to know what takes place in a machine when adjustments are made or neglected, and why it takes place, that the National Tractor and Automotive School and other authorities gave free lectures in the tents. These lectures were well attended and excited the closest interest.

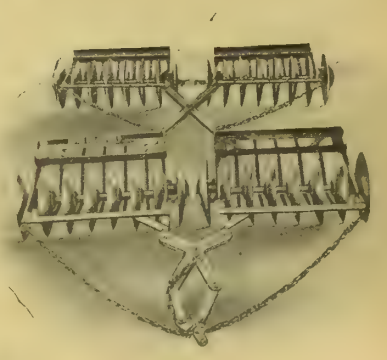
KILLEFER QUALITY

The Killefer Automatic Double-Disc Harrow

KILLEFER EFFICIENCY

The Sensation of the Tractor Demonstration





(Automatically Straightened)

The above cut shows the Automatic Double Disc Harrow automatically straightened.

To accomplish this, the tractor is backed up until the hook on the draw chains can be placed in the hole on the front end of the adjusting swivel; then, by going ahead about 18 inches, the disc is drawn straight.

To set for working position again, pull out the hook and go ahead. This can all be done by the driver from the seat of most tractors.

Without a doubt this is the most important development to be made in the manufacture of farm tools to date. This is the **only Automatic Double Disk Harrow** on the market. It was designed and built in our own shops, completely; we are, therefore, the **originators** and have it **fully covered by patents.**

In the development of this, our latest triumph in **Disc Harrows,** we have not only maintained the great strength and durability as originally designed, but have added two additional most valuable features; namely, our **Automatic Shifting Device,** controlled by the operator from the seat of his tractor, and a **greater flexibility,** so desirable in a **tractor Disc Harrow,** but not found in other makes.

This Harrow is built in all sizes from 5 to 12 feet, inclusive.

The Killefer Manufacturing Co.

2209-21 Santa Fe Ave. Box 156 Arcade P. O. LOS ANGELES, CAL.

SUBSOILING BAKED CLAY.

R. L. Merchant, ranch superintendent of the Pacific Sugar Corporation, Tracy, writes to the Killefer Mfg. Co. as follows: "We are using one of the extra heavy tractor chisels and find it to be just the tool for extra hard land. I am subsoiling a field of baked clay which has never been plowed over four inches deep. We are going down 18 inches and are pulling with a 90-horsepower Best tractor and are compelled to run on low gear to get through. I can heartily recommend the Killefer tools to do the work where strength and durability are needed. Stop in when you come around and we will show you some hard subsoiling that 'can't be did.'"

Subsoilers going eight to eighteen inches deep are replacing plows for preparation of grain seedbeds in Imperial county, according to B. D. Irving.

General Agricultural Review

DATES OF FAIRS.

Dates for fairs in California are:
Oakland Land Show and Exposition—September 9-October 6.
Fresno County, Fresno—October 1-5.
Southern California, Riverside — October 8-12.
Napa County Fair—October 10-11-12.
California Liberty, Exposition Park, Los Angeles—October 12-26.
Livestock Show, San Francisco—November 2-10.

Field Crops.

The bean loss from the rains in the vicinity of Hughson is reported light. Late planted beans are benefited.

Reports from the rice fields are to the effect that the rice has fully caught up to its schedule and will be harvested on time.

The U. S. Department of Agriculture urges early harvesting of rice to save the crop from the ravages of migratory ducks and other wild fowl.

The Oakdale section, which a quarter of a century ago was one of the foremost wheat production districts in California, has pledged itself to go back to wheat again this year.

The San Joaquin Valley Sugar Company at Visalia has closed its mill for the season. The output of sugar is several thousand sacks in excess of the high mark of other years.

J. H. Stephens, president of the Rice Growers' Association, estimates California's 1918 rice crop at 3,000,000 bags. There was a total of 147,000 acres planted this year, as against 80,000 last.

The action of the Food Administration in prohibiting the manufacture of beer after December 1 virtually deprives the growers of a market for about 50,000 bales of hops, is the claim of the secretary of the Hop Growers' Association. The growers are seeking means to save themselves from this heavy loss.

Imperial Valley grew about 145,000 acres of cotton in Imperial Valley this year, of which 60,000 acres was volunteer. E. E. Kaufman of the U. S. Bureau of Crop Estimates says that the condition of the crop indicates an average yield equal to that of 1917, but owing to the increased acreage the amount harvested should show an increase.

The healthy demand that exists for all vegetable seeds will insure a market for the good crop of seed harvested in California, especially the river district. Beet, spinach, carrot, lettuce, onion, parsnip, and radish seed are all reported fair to good. Salsify and cabbage seed will be shy. There is room for more attention being given to the production of guaranteed seed in California.

The California Castor Bean Association, which is under contract to furnish several thousand tons of castor beans to the U. S. Army aviation supply bureau, will have its beans in the San Joaquin Valley delivered at Hanford, according to Professor Cocheron of the University of California. The association will pay 6½c per pound for beans cleaned of hulls and spikes f. o. b. Hanford.

Paul Williamson, who farms 200 acres of beans just south of Lathrop, after reviewing the result of the rain storm, says he believes his late beans have been greatly benefited by the recent storm. He expects to harvest at least five sacks more per acre. The rain was better than an irrigation and he doesn't believe his earlier beans were injured in the least. He thinks his experience is typical of that of other growers in the same district.

Deciduous Fruits.

The California Fruit Canners' Association plant at Marysville packed 90,000 cases of peaches this year.

The green fruit crop is very light in England this year. Plums sold at 36c a pound green, and other fruits in proportion.

According to Superintendent Hill of the Yuba City cannery, something like 102,000 cases of peaches were canned this year, against 96,000 cases last year.

Approximately 13,000 tons of California dried peaches, representing 65 per cent of the peach crop of the State, have been secured for Government use.

The State Almond Exchange is making advances on the 1918 crop now on the following basis: Nonpareils, 15c; I X L, 14c; Ne Plus Ultra, 13c; and Drakes, 12c.

Oakdale is preparing to handle 20 carloads of almonds this year. The Oakdale Almond Exchange is handling the entire crop this year, the sulphuring being done on the spot.

Guggenheim & Co. last week shipped the first carload of walnuts of this season's crop from Santa Ana. The carload was valued at $20,000 and the nuts were of high grade.

Inadequate thinning of peaches and other stone fruits results in smaller fruits and consequently diminished returns. Also the extra number of pits is a heavy pull on the soil and on the vitality of the tree.

Horticultural Commissioner Penny of Santa Cruz county reports the leaf-roller present in apple orchards in large numbers this year. Thirty-five per cent of the fruit has been attacked. Examination of infected orchards shows many egg masses on the trees at this season. The leaf-roller either totally devours the young fruit or scars it so as to injure its quality. A miscible oil applied when the tree is dormant will kill the eggs.

Citrus and Semi-Tropical.

In the Winters section, where many of the black figs are grown, the bulk of the crop was destroyed by the untimely rain.

Tulare county is the second county in the State in citrus culture, with 33,897 acres of oranges (of which two-thirds are navels) and 4313 of lemons, grapefruit, etc.

It is reported that a prominent olive broker recently said that the demand for California ripe olives is increasing in the East, and that the public is coming to know that the ripe olive is a superior product. The superior pack of the Oroville plants has helped much to this end.

Grapes.

Livingston alone will ship 300 cars of table grapes and 40 cars of peaches this year.

According to late advices from the East, wine grapes will reach $80 to $100 a ton in the New York market.

Grape crushing is now proceeding. The big central valleys' wine grape crops will be supplemented by a heavy tonnage of culls from the table grape vineyard.

The price for commercial varieties of rooted grape vines will be $25 a thousand this season and deciduous fruits will average from $250 to $300 per thousand for No. 1 stock.

Fresno fruitmen report that last week's showers did very little damage either to raisins or to table grapes on the vine. Some of the bloom was washed off the grapes, but the cool winds following the showers apparently kept the berries from splitting after the shower. Some of the raisins on paper trays were slightly damaged.

Miscellaneous.

Twenty thousand acres of tule land along the Sacramento river in Yuba county are to be reclaimed.

Professor Thomas Forsythe Hunt, dean of the College of Agriculture at the University of California, is now in England with a special commission headed by Dr. W. O. Thompson, president of the Ohio State University, to study food production in France and Italy.

Does Such an American Exist?

Can there be any American who is not doing all he can to help win the war? Who pretends to believe that we could have kept out?

Who whines or growls about the little sacrifice he is asked to make?

Who gets panicstricken and thinks that it would be better to compromise with the Hun and listens to the serpent whisperings of German propaganda?

If such an American exists let him realize what Germany has done to Russia, which gave in and negotiated a cowardly peace.

There is only one thing for us all today and that is war to the bitter end—war until the Hun is utterly and completely destroyed.

For those who cannot fight, LIBERTY BONDS are the best possible weapons against the Hun.

The Brood Sow Tells How to Raise Pigs

(Told to R. H. Whitten and written for Pacific Rural Press)

We have a new herdsman—a colored fellow. Yesterday I heard him tell the boss that if he was drafted he would rather join the army than the navy, "because," he said, "Ah can run faster than Ah can swim."

I wish our boss would join the army of progressive swine breeders who are using modern methods in feeding and caring for their hogs, instead of being "in the swim" with the great mass of farmers who just give the work a lick and a promise. Not because I want my pigs to be brought up in luxury, but simply because it is his duty to fight for better results with improved methods. Patriotism demands that he do his part to increase the supply of the greatest of all war foods, not only by raising more pigs but by bringing them to marketable age in the quickest time and at the lowest possible cost.

I told you a couple of weeks ago how the boss ought to care for me and my pigs up to weaning time, but even if he does all that he can't turn the pigs loose at weaning time and expect them to develop properly.

One day, as he leaned over the fence, I heard him say: "Blood will tell." I guess he thought that just because my pigs were royally bred they were bound to develop into crackerjacks. The poor hick ought to know by this time that it requires proper feeding to make blood tell, and that the value of an animal at breeding or marketing age depends just as much upon the way it has been developed up to that age as it does upon its value at birth as determined by its pedigree and individuality.

I guess every hog raiser knows that the secret of success is in keeping the "baby bloom" on pigs as they develop. This is easy enough up to weaning time, but the real period when a pig is "made or marred" is after weaning, when the attendant begins to feed in a mechanical way and turns his chief attention to other things that he considers more important. He couldn't make a worse mistake, for there is no animal that will go backward from lack of care quicker than a hog, and a very little difference in the care of a season's crop of pigs may mean a difference of several hundred dollars in value at selling time.

CASTRATING PIGS.

If the pigs are to be raised for market, all boars should be castrated two weeks before weaning time, as it gives them too much of a setback if done right at weaning time. I've noticed that the earlier it's done the less the shock is to the pigs and the less their growth is checked.

Select a clear, dry day to do the work. It should never be done on a rainy day, and if the pigs are to be turned into a field after the operation it should be free from mudholes and wallows.

Bad effects from this operation are rare, but once an abscess developed on one of my pigs. The boss opened it with a clean knife, washed it twice daily with an antiseptic solution, and the abscess disappeared in a very few days.

WEANING THE PIGS.

Of course the boss expects to raise spring litters from as many sows as possible, so he will breed all of us except the gilts that had litters when a year old. A sow should not have her second litter until she is two years old, so these gilts should be carried over, and their pigs may be allowed to nurse for ten or twelve weeks. But all other litters should be weaned at eight weeks.

With the boss weaning means simply separating a sow from her pigs, but that's a pretty crude way of doing it, and it is bad for both sow and pigs. About four or five days before weaning time a sow's slop should be cut down and dry feed should be substituted, so as to check her flow of milk. But the pigs should have the slop in their creep increased enough to make up for what they fail to get from their mother.

Our boss always takes the pigs away from us, but I notice that they worry when moved to a new field and do not eat readily. A much better way is to take a sow away from her pigs and return her in twenty-four hours for them to nurse for a few minutes. Then keep her away for thirty-six hours; then for good unless she has an unusually heavy flow of milk, in which case it may be necessary to put her back once more. Her udder should be watched carefully to see that it dries up properly, so that no injury will result to her and the udder will be in perfect shape for the next litter.

If there are a few small pigs in a litter, it's a corking good idea to leave them with the sow for a few days after the others are separated. The extra supply of milk will push them along and enable them to catch up with their mates, and when you put them all together again you won't be able to tell which ones were the runts.

FEEDING THE GROWING STOCK.

Proper development does not mean simply an increase in weight. The pigs should be kept gaining rapidly, but during the first few months this gain should be in bone, frame and muscle, and not in fat. After the pigs have developed the proper frame, the finishing touches can be put on in jig time, for it does not take long to load 100 pounds or more of fat on them. But while they are growing a safe rule is to keep them in such flesh that it would require sixty days to finish them off for the market.

How can the proper growth be secured? Well, it's as plain as the curl in my tail that no young animal can develop the proper bone and muscle unless feeds are provided which furnish the necessary material to make bone and muscle. And exercise is just about as necessary as feed.

GOOD ALFALFA DESIRABLE.

It gives me a pain in the jowl when I hear people talking about grain as though it were the most important article in our diet. Sure we like grain, but from the standpoint of development alfalfa contains the elements most necessary for growth, and from the standpoint of economy we can be developed much more cheaply on an abundance of good alfalfa and a light grain ration than on limited pasturage and an abundance of grain.

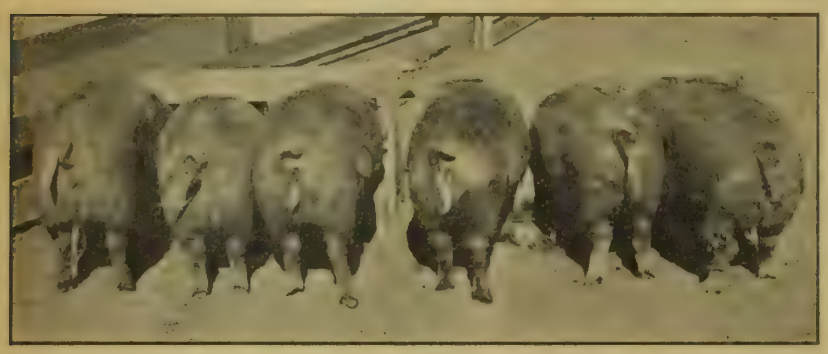
It is always profitable to feed some grain to growing pigs, but the more alfalfa they can be made to eat the more the grain bill will be cut. So if possible they should have an abundance of green, juicy alfalfa, and should never be fed so much grain that they will have no appetite for alfalfa.

I recently herd one of those Government fellows telling the boss that it pays to use pasture in raising hogs because less grain is required for each hundred pounds of gain; the rate of gain is increased; the hogs are generally more thrifty and in better health; an even distribution of manure is obtained, and labor is saved. Why, he said that from 10 to 25 per cent of grain is saved by using good pasture crops in pork production. Also, the amount of protein feeds, such as tankage and oilcake meal, which make up the most expensive part of the grain ration, can be cut in half.

Of course alfalfa is the best pasture crop, but if a fellow can't raise alfalfa on his land he ought to put in rye, millet, rape, sudan grass, soy beans, cow peas, or a combination of some of these.

GRAIN.

Our grain ration at present is determined more by what the boss can get and what he has to pay than by what we would like to eat. Growing pigs ought to have millfeed for several weeks after they are weaned, but I hear the boss say that it is next to impossible to get shorts or middlings now, so he is substituting one of the proprietary feeds and is getting pretty good results. He uses about one-third of this to two-thirds of barley which he raises himself. When the pigs are four months old he will cut out the proprietary feed and use ground barley alone. Later, when the milo is threshed, he will use that as a single grain for finishing off the market stock, having it



Junior yearling sows bred at Carruthers Farms. Notice their thrifty condition. A good example of what can be accomplished when proper feeding is combined with scientific breeding.

WRITE OR CALL.

R. J. YATES **Orland, Cal.**

ground rather coarsely, as it gums if ground too finely.

We hogs like variety just as well as you human hogs do. But right now I know that it's next to impossible for the boss to give us much of a change. And perhaps it isn't so necessary after all. In pens near me at the State Fair Mark Bassett of Hanford had some of the best fitted hogs I ever saw, yet I heard him telling another breeder that the hogs had received nothing but soaked barley, in addition to alfalfa pasturage. For about a month after the pigs were weaned they were given a little Sure-Milk with the barley, but after that no tankage, oilcake meal, millfeeds—nothing but plain rolled barley. And soaked in nothing but water.

Just the same, I'll bet his son Archie fed more by eye than by rule or measure. I'll bet he kept his peepers right on those hogs all the time to see that they were developing properly. He kept their quarters as clean as a parlor; he provided them with fresh, cool water, and with shade and shelter; he fed them regularly and kept their troughs clean; he kept a tonic before them to improve their health and prevent worms; he watched for lice and dipped or sprayed if any were noticed; he had the hogs so tame that they were always ready for a friendly scratch back of the ears.

Take it from me, all of these things count. There is a lot more to successful hog raising than most people think. Little things? Yes, but you know the little leaks are what sink the ship, and if a farmer won't pay attention to little details he never will get any big hogs. At least at a profit, and it's the almighty dollar that he's after.

WHY YOU SHOULD KEEP SHEEP.

The initial investment in foundation stock is small.

Expensive buildings and equipment are not necessary.

Less productive land can be utilized.

Sheep will eat almost every class of weeds, and the cost of maintenance is small.

By cleaning out the fence rows they destroy the winter protection of many injurious insects.

Due to the fineness of the mastication of their food, very few weed seeds are found in sheep droppings.

The excreta of sheep is rich in nitrogen and potassium, and crop yields are increased by the constant and uniform distribution of rich manure.

Sheep can be made marketable without grain, if desired.

Sheep make profitable use of fodder left in corn fields after corn is harvested.

Less labor is required for sheep than for grain or any other kind of livestock.

The population of the United States is increasing, while the number of sheep is steadily decreasing.

Wool and mutton advanced in price before the war, and a drop need not be expected after the war is over.

Thomas Harrison of Glen Ellen thinks that there should be no distinction between the beef and the milking Shorthorn. He argues that they are all Shorthorns and should be shown in the same class. He has both kinds, but finds that the demand is twenty to one for the milking Shorthorns. He says he advertises in almost every farm paper in the United States, but gets more answers from the Rural Press than from all others combined. That's because our circulation represents quality as well as quantity.

N. K. Horan of Lockeford made extensive purchases of Poland-Chinas to add to his already fine herd. From Young & Clark he secured the remaining half interest in Big Bone Bob, thus making him the sole owner. From J. H. Hansbrough he bought the 1917 grand champion boar, Major Hadley Wonder, and several of his daughters. From J. W. Wakefield he purchased eight fine March gilts. Watch this herd.

Margin to Encourage Beef Feeding

[Written for Pacific Rural Press.]

At a meeting of the California Cattlemen's Association some time ago the profitableness of feeding cattle on a four-cent margin was discussed, and O. B. Fuller stated that on this basis cattlemen could figure on about $7 per head to cover all losses, tail-enders, interest and profit.

Mr. Fuller is a member of the C. H. & O. B. Fuller Co. of Los Angeles, who feed about 10,000 head per year, and whose cattle holdings are exceeded only by those of Miller and Lux and the Kern County Land Co. They operate five ranches in California, five in Arizona, and one in Mexico.

An experience feeding 760 head in Los Angeles last winter gave concrete basis for the general figures given by Mr. Fuller to support his statement. The cattle were fairly well bred Hereford grades, two and three years old, fed 100 days beginning last February. They averaged about 800 pounds at the start and were sold averaging 1050 pounds. About half were sold at 14c, the other half at 13½c. The older cattle were fatter and took the higher price.

Cottonseed meal cost $60 a ton and hulls $16 at the feed yards, eight pounds of the former and 35 of the latter having been fed on the average. Labor was figured at 3c per day per head. This made feed and labor cost 55c per day or $55 per head for 100 days. If the feeders, which were of their own raising, were figured to cost 8c per pound, the original cost plus the cost of feeding totaled $119 per head.

If these steers had sold at 12c per pound—a four-cent spread—they would have brought $126, leaving $7 per head, plus the value of the manure produced, to cover death, accident, tail-enders, interest on investment and profit.

Is this enough to encourage beef production and feeding?

Will This End the Meat Trust?

[Written for Pacific Rural Press.]

Senator Borah of Idaho, who has been selected to push proposed legislation to take over parts of the packing industry, and Herbert C. Hoover, Food Administrator, have been holding conferences with a view to bringing the Federal Trade Commission, the Food Administration and Congress into an agreement as to the best method to pursue to control the meat industry of the country.

Hoover is said to admit the advisability of the Government's taking over the stock yards and the rolling stock controlled by the five big packing concerns, but he is hanging back on taking over the branch houses of the big packers in various cities throughout the country for fear such action might interfere with the plan of food distributions necessary to the conduct of the war.

Senator Borah is strongly of the opinion that the packers must be divorced from nearly all of the 108 industries in which they are interested outside of meat packing. To break up their alleged monopoly, he contends, it will be necessary to enact legislation to confine them to the business for which they were primarily organized. A strong fight is expected in Congress on the proposition of permanent Government ownership of the stock yards as a public utility.

ENTRIES FOR SAN FRANCISCO SHOW POURING IN.

Joseph M. Painter, manager of the California International Livestock Show, is being swamped with entries and expects to stage one of the best shows of its kind ever presented west of Chicago. He is particularly gratified at the number of breeders from other States who will exhibit, thus making the competition more keen.

The premiums for the livestock exhibits amount to $30,000, while the hore show premiums total $10,000. At the conclusion of the awarding of livestock premiums there will be a sale of fat cattle, and the different packers have promised spirited bidding.

The show will be held November 2 to 10, and the entries will close October 5. If you are going to show, send in your entries now. Don't wait until the last minute.

E. E. Freeman of Modesto is starting to test Fancy Pietertje Hengerveld De Kol 2nd and Una Estrella De Kol 2nd. Both cows are in fine shape and Mr. Freeman expects to make good records.

LIBERTY FAIR BERKSHIRE SALE

Here is the opportunity you have been wanting to get choice breeding stock at your own prices.

Never before were the prospects for swine breeders so bright; never before were Berkshires so popular in this state. Now is the time to get into the game; the Berkshire is the hog to bank on.

50 HEAD—BEST IN THE WEST

Mostly Bred Sows—A Few Choice Boars

The names of the consignors are enough to guarantee the quality of the stock.

These breeders have selected some of the best animals from their herds, in order to place the right kind of stock in the hands of beginners.

It is just the kind you ought to have to get started right and to insure your success.

Financial Assistance to Cattlemen

[Written for Pacific Rural Press.]

In some parts of the West the loaning capacity of local banking institutions has been impaired by the lengthened credit extended as a result of the feed deficiency, and the consequent inability of cattlemen to market their stock in proper season.

So in order that financial assistance may be extended to cattlemen in such sections the War Finance Board is in a position to advance money for four-month periods at 5 per cent interest, up to 75 per cent of the loans heretofore made by such banks to cattlemen.

For stock-raising purposes provision can also be made for longer term loans at 6 per cent, where it is impossible to secure such loans through regular channels.

In exceptional cases it is provided that loans may be made direct to persons, firms or corporations other than banks.

If you need money, write to D. J. Stollery, secretary of the California Cattlemen's Association, 320 Sharon building, San Francisco. He will gladly tell you how to proceed to make application for a loan. Mr. Stollery is doing work of inestimable value to the cattlemen of the State.

Short Course in Stock Raising

[Written for Pacific Rural Press.]

"Without livestock on the farm, or without artificial fertilization, crop production will gradually decrease until it no longer yields profitable returns," is a statement just issued by the College of Agriculture of the University of California, and stock farming as an aid to the stability or increase of crop production is strongly advised.

To aid those who have had little or no experience in stock raising, the chief principles and practices will be taught in the various short courses to be given at the University Farm, Davis, September 30 to November 8. These courses include animal husbandry, dairy manufactures and poultry husbandry. They will be followed by two-week courses in market-milk production, butter making, cheese making, and the use of milking machines.

Further information may be obtained by writing to the College of Agriculture, University of Califor-

Is There Profiteering in Millfeeds?

[Written for Pacific Rural Press.]

There appears to be considerable misconception relative to the Government price-selling schedules on millfeeds among buyers of such commodities. The following letter from a subscriber at Bodega, Sonoma county, is typical of many inquiries of the same kind:

"In your issue of September 14 you quote bran $23.75 and midds $25.75, mixed feed $25 per ton in carload lots. I bought 200 sacks of bran and 89 sacks of midds, which cost me $38.65 per ton at Bodega road depot. I may add that my order went in with others to help the storekeeper make up carload lots."

The schedule of millfeed prices as announced from Washington on August 1 is as follows for the principal Pacific Coast mills:

Mills—	Flour	Bran	Mixed Feed	Middlings, Shorts, Red Dog
Portland	$9.95	$23.15	$24.40	$25.15
Tacoma	9.95	23.15	24.40	25.15
Astoria	9.95	23.15	24.40	25.15
Seattle	9.95	23.15	24.40	25.15
San Francisco	10.15	23.75	25.00	25.75
Los Angeles	10.35	24.30	25.55	26.30
San Diego	10.27	26.81	28.06	28.81

Now, in order to determine what may be considered a fair price for middlings, for example, from the consumers' standpoint, there must be added to the above prices the cost of packages and packing, loading on cars, freight to Bodega, and the dealer's legitimate profit. In the particular case in question this would figure out about as follows:

Middlings at mill door	$25.75
Sacks, 33 1-3 sks. (60 lbs. to sk.) @25c.	8.33
Twine and labor of sacking (say)	.70
Loading on cars	.40
Freight to Bodega (estimated)	2.00
Dealer's profit (say)	1.50
	$38.68

There may be some slight discrepancies in the minor items of this estimate of cost at terminal point, but these would not materially affect the total.

TWO BIG LIVESTOCK SHOWS.

Los Angeles, October 20-26; San Francisco, November 2-10. Two new shows that promise to eclipse the recent State Fair in the exhibition of livestock. Bigger entry lists, better show facilities, larger attendance expected.

And not only will there be fine exhibits of cattle, horses and sheep, but also of poultry, goats and pet stock. There will be horse shows, good music, lectures, social and society events—everything that can be thought of to add to the enjoyment or educational value of the affairs.

Entries for the Los Angeles show are just closing; those for the San Francisco show will close October 5. Don't let it be said "to late."

LIVESTOCK AT LIBERTY FAIR.

Most things are greater in anticipation than in realization, but the livestock show at the Liberty Fair promises to be a notable exception. Everything is now virtually completed and the grounds, the buildings, the entries, the plans for managing the affair—all point to a show that will prove an epoch-maker in the livestock industry of the West.

The premiums amount to $33,500 and have attracted most of the leading herds in the Rocky Mountain and Coast States. The fair will extend from October 12 to 26, but the livestock show will be held during the last week, beginning on the 20th. Paste this date in your hat and plan to attend whether you can or not.

E. F. Young of Modesto is testing several cows, among them being Theodora Ida Belle Johanna and Silvan Iris Currelia, both of which are good prospects for high records.

Time to Vaccinate for Blackleg

[Written for Pacific Rural Press.]

This is blackleg season. The disease is most liable to make its appearance in the late summer or fall, and if you have not protected your young stock from it you should do so at once.

Don't wait until you go out in the field and find several of your favorite calves dead, and liable to be that way for some time. This is a rapid-fire disease, and the infection usually terminates fatally in from twelve to forty-eight hours after symptoms are apparent. A few cases may linger for several days, and very rarely an animal may recover, but as a rule it is too late to do much for a herd after it has become infected, and the only safe way is to vaccinate every spring and fall, as the disease is liable to occur in the spring as well as the fall.

Cattle under two years are most subject to blackleg, the greatest number of deaths occurring in animals over six months and under two years old. Consequently, all up to and including two years of age should be treated.

The disease is caused by a germ that lives in the ground, and is so small that it can only be seen with the aid of a microscope. The germ enters the body of an animal with food and water, or through wounds in the skin. It multiplies rapidly, subsisting on and destroying the body tissues.

Affected animals usually become feverish, stop eating and chewing their cud. Lameness develops suddenly, and is usually accompanied by trembling of the muscles and arching of the back. These symptoms are followed by the development of characteristic blackleg swellings, which at first are hot and painful, but later become cold and painless, and crackle on pressure.

Swellings due to blackleg develop most frequently on one of the quarters, but do not extend below the knee or hock. More rarely they are found in the muscles of the back, chest, neck and throat. As the disease progresses the swellings increase in size, and the affected animal soon falls or lies down and dies. In more protracted cases the animals may be down for some hours before death and show evidence of great pain and difficulty in breathing, and often die in convulsions.

Bodies of cattle that have died from blackleg often become enormously swollen from the rapid formation of gases in the tissues and intestinal tract. Frequently bloody froth is discharged from one or both nostrils. The skin over the swellings feels like parchment paper when handled, and if removed the flesh underneath is dark in color and distended with gas bubbles.

Practically all losses from blackleg may be prevented by the systematic vaccination of all young cattle a few weeks before the season when losses occur. Blackleg vaccine, in different forms, has been used for many years. The most popular is the pill form, as it is the easiest to use, and the dosage is uniform. The powder form is falling into disuse because of the impossibility of giving uniform doses, and the string form is seldom used on account of the tediousness of administration.

However, blackleg vaccine has certain limitations, the more important of which are the occurrence of severe reactions and possibly occasional deaths from the vaccination itself in extremely susceptible animals, and insufficient protection in others.

It has not been found possible by means of a single vaccination to obtain adequate protection in all individuals without increasing the strength of the vaccine to a degree where it would be dangerous for the more susceptible animals. These difficulties—lack of protection and occasional losses—are eliminated to a great extent through the use of double blackleg vaccine, and by revaccination, but both of these plans require two or more handlings of the animals.

Recently two new blackleg immunizing agents have been developed which overcome the deficiencies of vaccine. They are known as filtrate and aggressin. Both are sterile (germ free) and may be used without danger of causing blackleg. And since they are but slightly toxic, they may be given in sufficient dosage to safely immunize most animals with a single dosage.

Some manufacturers of germ-free vaccine guarantee lasting immunity, but conservative authorities state that no product has been in use long enough to justify the "protection for life" claim, and they advise revaccination every six months, no matter what vaccine is used. Understand, they do not say that these claims are false. They merely feel that the products should be tested over a longer period of time before they are recommended to protect for life.

Consequently, when deciding on what form of vaccine to use, the following facts should be considered:

Pills are the cheapest and most convenient, but there is an occasional loss, and at times a lack of protection. They are placed under the skin with a pill injector.

Filtrate is germ free, and safe to use. It will give good protection and is comparatively inexpensive. It is the most suitable for general purposes. The dose is 5 c.c. injected under the skin, usually in front of or back of the shoulder.

Aggressin is also germ free, but it is more potent than filtrate; in fact, the most effective immunizing agent against blackleg in use at the present time. However, it is more expensive, and its use is advised only for purebred animals, or exceptionally valuable ones intended for breeding purposes. The dose is the same as with filtrate, but for all these different forms complete directions are given by the manufacturers.

If you haven't vaccinated this fall, get busy. There is no time to lose. It should be done right away. Remember, it's better to be safe than sorry.

John M. Bernstein
is the consignor of
Five of the Best Registered Sows
ever put into an auction sale in California.

MAIDS BEAUTY is first on the list. Next are DUTCHESS HADLEY and sister, COUNTESS HADLEY. Then comes STRATFORD BETSEY and sister, SO LONG LETTY, both with litters at their side, sired by KING TIMM.

Be sure and see these five before buying.

BUY Registered HOLSTEINS
and keep up with the times!

President Munn of the American Jersey Cattle Club recently said:

"There is going to be one ideal, and the man who does not look up to it, who hasn't the vision to see it, or the feeling in his heart to respect it is going to have no place on the surface of this earth where he can rest his head. And that is as it should be."

There is a whole banquet for thought in that statement for the man who figures that he can keep on with the same old scrub dairy cows and "get by" in these changed days.

Sell that boarder cow, or fifty of them if you are unfortunate enough to have that many, to the butcher today, she was never worth so much on the block before, and invest the money in a few good registered Holsteins, and assure yourself of a place in the new order of things in dairydom that will be both creditable and profitable.

Come to the farm of W. H. Ginn & Son, 1½ miles southwest of Corcoran, Kings county, California, on Thursday, October 10, and you will find an opportunity to buy registered Holsteins that will make a real herd for you. The entire herd will be dispersed to dissolve a partnership, including the herd sire, Aralia De Kol Pontiac Salambo, with 25 of his daughters and 34 cows and heifers in calf to him. His three nearest dams average 30.26 lbs. butter in 7 days and 24,158.26 lbs. milk and 1031.86 lbs. butter in one year. This is the blood you need—the kind that produces big throughout the year.

Then there are 24 daughters of Mercy Sir Pondyke, who is by a son of King of the Pontiacs, the only sire to have over 200 A. R. O. daughters.

There are several choice young bulls in the sale, just right to go into good dairy herds, and nobody expects that they are going to sell for more than moderate prices.

Every animal in the sale is guaranteed to be a breeder, and every animal over six months is tuberculin tested and sold subject to tuberculin retest except a few of the older cows that will be sold as represented on sale day. Be on hand early, as the sale will start promptly at 9:30 a. m., with Col. Ben A. Rhoades, Los Angeles, on the block.

SACRAMENTO . . CALIFORNIA

What would be the Result

By using one of these Bulls in your Herd?

NO. 1—602.83 pounds butter, dam's record as a two year-old. Sire, King Mead of Riverside, sire of seven two-year-olds that average 719.27, and the first two tested at mature age have each made above 1200 lbs., one of which holds the world's strictly official yearly record of 1331.76 lbs., all averaging over 4 per cent butterfat.
One of the finest individuals you ever saw—from a great proven dam and by a sire that has proven himself one of the leaders of dairy sires—and ready for heavy service.
Would it be possible to invest $250.00 that would bring a greater return?

NO. 2—And just look at this: Dam's record 714.17 pounds butter as a two-year-old, and she a daughter of the world renowned King of the Pontiacs—and her dam a three-quarters sister to the great Prince Gelsche Walker.
Sire, King Korndyke Pontiac, one of the very best bred sons of King of the Pontiacs, and sire of the well-known $6,500 bull, King Korndyke Pontiac 20th. King Korndyke Pontiac's dam is also a half sister to Prince Gelsche Walker.
A magnificent individual—wonderful line breeding—blending in the closest manner two of the greatest producing blood lines ever known. He is ready for immediate use and is offered at the ridiculously low price of $400.00.

HOW TO HAVE DAIRY COWS TESTED.

[Written for Pacific Rural Press.]

Many dairymen do not seem to understand the meaning of dairy law No. 576, which requires that cows from which unpasteurized or raw milk is sold must be free from tuberculosis. Some have understood that free testing by the State had been discontinued. Dr. J. P. Iverson, State Veterinarian, gives the following information:

"This law requires that cows from which raw or unpasteurized milk is to be sold be tuberculin tested by a representative of this office or a recognized representative of any county or city inspecting department, and this service is required to be furnished the cattle owner free of charge. This office has not discontinued the practice of testing cows for tuberculosis free of charge and we have a number of inspectors regularly employed on this work throughout the State. The law does not permit the collecting of a fee for this testing."

Some dairymen have been led to believe that all they need is a certificate from a local veterinarian stating that he has tested the cows and found them free from tuberculosis, but such certificates are valueless. If you want your cows tested so as to comply with this law, send a card to the State Veterinarian, Sacramento, stating the number of cows you wish tested and your location, so his representative can find you easily. The work will then be done at no cost to you.

As to the necessity of retesting, Dr. Iverson says: "Dairymen selling milk must have their cows tested every six months if reactors are found in the herd. If no reactors are present, an annual test is required."

NOVEL JERSEY JUDGING AT ORLAND.

[Written for Pacific Rural Press.]

For judging the Jerseys at the Glenn County Fair the American Jersey Cattle Club furnished a score card on which was a large circle marked off in multiples of five and totaling 100, to indicate the 100 points of a perfect score.

On top of this was a smaller circular card, pivoted at the center so as to whirl around. This was divided into sections to correspond with the different features of a cow, and gave the number of points for each feature, these being: Head 7, neck 4, body 37, udder 26, teats 8, milk veins 4, size 4, general appearance 10. As each feature was judged, an arrow on the smaller card was turned to indicate on the large circle the number of points allowed. After all features were considered, the complete score was registered.

There is much to be said both for and against score card judging, but whenever it is employed this method will be found of great convenience in keeping scores.

BEET PULP PRICES FIXED.

Maximum prices on beet pulp were recently announced by Food Commissioner Merritt as follows: Wet pulp direct from factory, 80c per ton; wet pulp from silo, $1.25 per ton; dry pulp, $40 per ton f. o. b. factory, including commission of wholesale distributors. Priority in shipment will be given dairy demands. The fixing of these prices is another step toward protection of the dairy and beef cattle herds of California from an actual world-wide shortage of feeds.

The Redwoods Ayrshire Farm (B. D. Weeks) at La Honda, San Mateo county, reports that Ada Rome of Willowoak, one of their registered Ayrshire cows, has given birth to triplets. All three are heifers, well marked and perfectly formed. They are all living and the owners expect to raise all unless something unforeseen happens. They are sired by Willowmoor Robin Hood 32nd, who is considered the best of the Robin Hood line.

DE LAVAL Separators Save in 7 Ways

QUANTITY of cream that no other separator will recover completely, particularly under the harder conditions of every day use.

QUALITY of cream as evidenced by De Laval butter always scoring highest in every important contest.

LABOR in every way over any gravity system, and also over any other separator, by turning easier, being simpler, easier to clean and requiring no adjustment.

TIME by hours over any gravity system, and as well over any other separator by reason of greater capacity and the same reasons that save labor.

COST since while a De Laval Cream Separator may cost a little more than a poor one to begin with, it will last from ten to twenty years, while other separators wear out and require to be replaced in from one to five years.

PROFIT in more and better cream, with less labor and effort, every time milk is put through the machine, twice a day, or 730 times a year for every year the separator lasts.

SATISFACTION which is no small consideration, and can only come from knowing you have the best separator, and being sure you are at all times accomplishing the best possible results.

Easy to prove these savings

These are all facts every De Laval local agent is glad of the opportunity to prove to any prospective buyer. If you don't know the nearest De Laval agency write the nearest De Laval office, as below.

DE LAVAL DAIRY SUPPLY CO.

LARGEST DAIRY SUPPLY HOUSE ON THE PACIFIC COAST.
Alpha Gasoline and Distillate Engines, Ideal Green Feed Silos, Acme Ensilage Cutters and Blowers, Irrigation Equipment, Centrifugal and Deep Well Pumps and Alpha Spraying Outfits. Catalogs of any of our lines mailed upon request.

61 BEALE STREET, SAN FRANCISCO

50,000 BRANCHES AND LOCAL AGENCIES THE WORLD OVER

Here is the Latest Photo of

King Korndyke Pontiac 20th

He has been looked over by many good judges recently and all agree that he is a wonderfully good individual and getting better every day. He looks a great deal bigger to us than the $6,500 we paid for him last December. You will begin to hear from some of his sisters soon, daughters of King Korndyke Pontiac, and everybody knows that his dam, Miss Valley Mead De Kol Walker, is one of the greatest heifers of the breed.

Why not breed your best cows or heifers to KING KORNDYKE PONTIAC 20th now, while you have the opportunity? Later on he will be needed for the exclusive service of our own females.

A few young bulls for sale, sons of Prince Riverside Walker, whose get won First at the State Fair. Our entire herd is tuberculin tested.

TULARE HOLSTEIN FARM

W. J. Higdon, Owner TULARE, CAL. H. L. Redd, Herdsman

Imported and American Bred Stallions

Percherons - Belgians - Shires

My Fall shipment of stallions has arrived. These horses were personally selected by me in the best breeding districts of Iowa, Illinois, and Indiana. Two, three, and four-year-olds that will weigh a ton or over.

The largest collection of Percherons, Belgians, and Shires west of the Rocky Mountains. State certificate of soundness and life insurance with each stallion. Every horse priced to sell according to his individual worth. Any reasonable terms will be given. I also have a carload of Heavy Draft Mares and Geldings for sale—age 4 to 7 years, weighing from 1400 lbs. to 1700 lbs. Matched teams in black, bay, or chestnut.

Correspondence invited and visitors always welcome.

N. W. THOMPSON, Patterson, Stanislaus County, California

Live Stock and Dairy Notes

Livestock breeders all over the State are invited to send, on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.

The Dairy.

A Kings City hay dealer has been disciplined for incorporating adobe dirt and other foreign substances in baled hay to increase its weight.

The Ayrshires shown at the State Fair we pronounced of excellent quality, and good enough to win in Scotland, the home of the breed. Authorities state that better Ayrshires are being bred in California than anywhere else in the world.

A. W. Morris & Sons of Woodland announce their big sale of 100 head of choice registered Holstein females for November 12, at their farm. This gives buyers an opportunity to get foundation stock from one of the most noted herds in America.

The older Tilly Alcartra gets the better she produces. A. W. Morris & Sons of Woodland report that this wonderful cow has gained over 2600 pounds on her former world record in 8½ months. For the month of August, which was her eighth month in milk, her daily average was 92 pounds.

A. B. Spooner & Sons of San Luis Obispo have a splendid son of King Korndyke Pontiac, born July 9, out of the $510 Holstein cow they bought at the December Guaranty Sale. This calf is a half brother to W. J. Higdon's $6,500 bull, which stood next to the grand champion at the 1918 State Fair.

McAlister & Son, the noted Holstein breeders of Chino, are making preparations to do some extensive testing this fall, and no one ever saw a finer lot of prospects than are to be found in their barns. Watch for State and perhaps world records to be made. This concern recently sold a fine young bull to James Donahue of Puente.

At the State Hospital, Stockton, grade cows are being fed 1 pound of grain for every 5 pounds of milk produced. Also the hay is fed in individual stanchions so that each cow gets her share. The milk is weighed every week and tested every two weeks. One cow gave 559.5 pounds of milk and 23.5 pounds of butter in seven days, and at present, seven months after calving, is giving 64 pounds of milk a day. Some production and persistency for a grade cow!

Swine and Swinemen.

F. A. Brush of Santa Rosa sold a herd of five Berkshire sows and a boar to H. C. Muddox, banker of Sacramento, who is establishing a herd for his son.

A. Buckland & Son of Fresno recently received a very fine Poland-China boar from the East, sired by Gerstdale Jones, the $6,600 boar. The best is none too good for their herd.

Elmer Lamb of Ceres recently sold a Duroc boar and a sow to Jake Rodgers of Gazelle, a sow to John Harder of Montpelier, and a boar to the Spreckels Sugar Company, Kings City.

Dr. L. J. Belknap of San Jose, who had announced a public dispersal sale of 50 head of Durocs, informs us that the demand has been so great that he will not be able to hold the sale and will sell his stock privately.

F. A. Brush, Berkshire breeder of Santa Rosa, received orders from the Kamehameha School of Honolulu for a Berkshire sow, also has an order for two sows from Guayaquil, Ecuador, and one sow from Rio de Janeiro.

H. P. Slocum & Son were so well pleased with their winnings at the State Fair that they decided to show at the Washington and Oregon State Fairs, then at a few of the California county fairs, and then at Los Angeles and San Francisco.

L. A. Denker of Saugus had his car sidetracked for several hours on the desert, on his way to the State Fair, and his herd boar, Director, died from the heat. This boar was sire of the pig that won the grand championship over aged boars.

H. I. Marsh of Modesto will show at the Fresno Fair the wonderful herd of Poland-Chinas that he had at the State Fair, headed by the well-known I B A Wonder. We'll bet Hale will be a "whole hog" when the ribbons are passed around.

C. C. Roberts, the enterprising Poland-China breeder of Chico, reports a litter of eleven husky pigs by Jumbo Model and out of Black Big Bone Model, one of his best sows, sired by Black Big Bone 2nd, grand champion of Iowa in 1915. Some royal blood in those pigs.

W. H. Rough of Arlington Station, Riverside, is doing his part to win the war by raising 125 head of big-type Poland-Chinas sired by the world champion boar, Superba, and out of Big Orange strain sows. He also has a fine herd of Jerseys headed by Raleigh Finance.

The James Mills Orchard Corporation of Hamilton City sold two carloads of fat hogs a few weeks ago for 18¼c—the highest price ever paid in California. At the State Fair someone told Mr. Mills that he was the only breeder in the State who had the nerve to raise Berkshires for the market in carload lots.

Hale I. Marsh, the Poland-China breeder of Modesto, has recently made the following sales: One boar to C. C. Brown, Durham; two boars to Franks & Miller, Antioch; two boars to Miller & Lux, Dos Palos; one boar to W. F. Cordes, Stockton; one boar to Sheldon B. Hunter, Bradley; seven boars to Joseph F. Lahaney, San Francisco; one bred gilt to J. H. Kindel, Modesto.

At the recent Glenn County Fair the officers of the California Swine Breeders' Association launched their State-wide movement to obtain better marketing and feeding conditions. Units of the association will be formed in every county, and eventually it is hoped to have every grower of pigs in the State a member of one of these units. The association will work to get the breeder a greater percentage of the price paid by the consumer, yet at the same time not run up the price on the latter. Also a pure feed law will be asked of the next Legislature, so that feeders will not be obliged to pay for filler often found in proprietary feeds.

Beef Cattle.

The Rancho San Julian Shorthorns, located in the mountains twelve or fifteen miles out of Santa Barbara, are in fine condition, and the calves are developing splendidly.

Arrangements are being made for two beef sales to be held at the San Francisco Live Stock Show. Shorthorns will be sold on Thursday morning, November 7th, and Herefords Friday morning the 8th.

Chas. Soule of Montague recently purchased from Carruthers Farms two bulls, aged 14 months each, for $1,500; also five heifers at $500 apiece. These heifers were by Count Glory and prove what a wonderful sire he is.

Dr. H. M. Elberg of the Roselawn Stock Farm, Woodland, informs us he will not sell all of his stock as announced previously by mistake, but will have a sale next spring of about twenty-five of his young Shorthorn bulls and heifers.

Congdon & Battles, the noted breeders of Aberdeen-Angus cattle, who sent their show herd down from Yakima, Wash., to the State Fair, recently sold a carload of yearling bulls to Thos. H. Davis, Visalia. S. Zaneth of Guadalupe also took a yearling bull.

Twenty-five head of Herefords from the noted herd of Harris & Sons of Missouri have been shipped from a Pacific port to the Princeville Plantation, near Honolulu. In the shipment were five bulls, the average price of which was $2,500, and twenty heifers went at $1,000 each. The heifers are bred to the $30,000 bull, Repeater. Why didn't California breeders get this order?

A list recently issued by Shorthorn breeders shows that in a period of three months 407 animals were sold at public sales at an average price of $1,550. The highest price recorded was $16,500; two passed the $10,000 mark; twenty-three reached $3,000 or more. Since this list was issued a Shorthorn bull has sold for $20,000. Shorthorn breed-

Endorsed by U. S. Food Administration

In these days of critical food shortage here's how Herbert Hoover, U. S. Food Administrator, feels about the California International Livestock Show:

"I am a firm believer that such enterprises not only further production in this country, but greatly improve the *quality* of production and have the utmost educational value in placing before producers, national necessities and methods in their attainment. I wish you every success."

Largest Exclusive Livestock Show ever held on the Pacific Coast

Representative exhibits of Beef Cattle, Dairy Cattle, Hogs, Sheep, Horses, Poultry, etc. There will be REAL COMPETITION. $38,000 in Premiums. Judging by nationally known experts.

Special Events: Night Horse Show, Band Concerts, Military Spectacles, etc. Every possible comfort for exhibits, exhibitors and spectators. You'll be welcome!

Special railroad rates from all points.

For detailed information write Joseph E. Painter, Manager, 1205 Merchants Exchange, San Francisco.

CALIFORNIA INTERNATIONAL LIVESTOCK SHOW

SAN FRANCISCO - NOV. 2-10, 1918

NOW Is The Time To Buy Holsteins

before the great demand after the war

AT THE

2nd MODESTO SALE, OCTOBER 17, 1918

OUR CONSIGNMENT INCLUDES:

A three-year-old heifer by the $15,000 bull, Spring Farm Pontiac Cornucopia, who is a son of the 44-lb. cow, K. P. Pontiac Lass, the highest record daughter of King of the Pontiacs. The first five dams of this heifer average over 34 lbs. butter in 7 days. Due to freshen November 8-18—to the service of King Segis Alcartra Prilly, the Grand Champion Bull of California, 1917-18.

A four-year-old daughter of Spring Farm King Pontiac, who is a 37-lb. son of King of the Pontiacs, bred to King Segis Alcartra Prilly. This heifer has a 22-lb. three-year-old record and is capable of making a much larger record.

Two high-class cows with 25-lb. 7-day records, one with over an 800-lb. yearly record.

A ten-months-old bull, beautifully marked, light in color and a great individual, sired by King Segis Alcartra Abbekerk, our senior herd sire, who is a 30-lb. son of the $50,000 bull.

Dam of this young bull made 29.86 lbs. butter in 7 days last winter and we look for her to make a very much larger record this winter as a four-year-old. Her dam has a yearly record of 980 lbs. butter from 24,000 lbs. milk. This bull is good enough to head a high-class purebred herd.

Our herd won at the California State Fair this year:

Grand Champion Bull	First Calf Herd
Grand and Senior Champion Cow	First Three-Year-Old Cow
Reserve Grand and Senior Champion Cow	First Yearling Heifer
Junior Champion Heifer	First Senior Heifer Calf
First Get of Sire	First and Second Junior Heifer Calf

Five other awards in classes

Also produced this year eight 30-lb. cows, with records from 30.41 lbs. to 37.60 lbs. butter in 7 days. Also nine two-year-olds making records above 20 lbs.; from 21 lbs. to 26.50 lbs. in 7 days as junior two-year-olds. No other herd in the West has made such a showing in one season.

BRIDGFORD CO., Knightsen, Contra Costa, Cal.

TYPEY SON OF MODEL FRANCIS GLISTA 173142

from a Daughter of Prince Riverside Walker.

The A. R. O. records of Model Francis Glista's dam, granddam and of his sire's dam and granddam average 30.70 pounds in seven days. His first seven dams average 4.25% fat. The calf's dam made a high record under unfavorable conditions. This and other young stock for sale.

C. C. SLATER Pacheco, Contra Costa County

ers are to be congratulated upon the present demand for their products.

Sheep.

J. W. Marshall of Dixon has just received two very fine Shropshire rams from England for use on his flock.

University of Nevada exhibited at the State Fair a $1,000 Corriedale ram, imported from New Zealand. Four of his ram lambs have already sold for $100 each.

The $3,000 Rambouillet ram purchased by Bullard Bros. of Woodland at the Salt Lake sale was pronounced by Prof. Coffey the best Rambouillet in the United States. At this same sale Bullard Bros. received $1,000 for one yearling and $650 for another.

The ram sale held at Salt Lake City was a great success, and both purebred stud rams and range rams sold for record prices. A yearling Rambouillet ram sold for $6,200—the highest price ever paid at auction for a ram of that breed. A number of rams of the same breed sold for $1,000 each.

J. Bidegaray of Fresno bought 31 Rambouillet rams at the recent Salt Lake sale. They were of Butterfield, Quealy and Bullard breeding and represented the cream of the sale. Mr. Bidegaray is doing a very extensive business, having sold over 700 rams to breeders in this State. Keep your eye on him and his stock.

The F. A. Mecham Estate of Petaluma reports a big demand for both registered and range rams. They have recently sold Rambouillets as follows: 24 to Henry Peters, Elmira; 36 to J. Menduca, Williams; 14 to David Squires, Hopland; 26 to Mrs. Winslow, Anderson; 11 to Wm. T. Veerkamp, Placerville; 3 to W. M. Smith, Cloverdale; 2 to J. B. Lofflin, Kelseyville; 2 to J. B. Roher, Montague; 2 to H. Jameson, Plymouth; 1 to C. Hostler, Santa Cruz. Shropshires, 4 to J. F. Ray, Albion; 2 to J. H. Clark, Laytonville; 2 to J. L. Cheney, Cazadero.

Livestock Miscellaneous.

Ruby & Bowers of Davis recently shipped several head of mules to Brazil. They believe that this is the first shipment of the kind to go from California to that South American country. But we'll bet our last shirt that it won't be the last.

L. B. Burk of the Bureau of Markets, Department of Agriculture, Washington, was at the State Fair investigating Coast livestock conditions, and particularly the purebred end. The Government plans on doing much to help breeders of registered stock.

A tract of 480 acres, part of the Fruitvale Estate, commonly known as the Kearney vineyard, 45 acres of which are in bearing Muscat and Thompson vineyards, bordered with fig trees, the remainder being in alfalfa and pasture, will be offered for sale on October 1, 1918, by the Regents of the University of California in order to aid the increased food production campaign and to obtain funds for the general betterment and more intensive cultivation of the remaining Kearney vineyard property. Invitations for bids, including a complete map of the tract and embodying all the terms and conditions of sale, are now obtainable at the offices of the Kearney vineyard at Kearney Park, Cal.

LIVESTOCK DIRECTORY.

SWINE

Poland-Chinas.

AM IN NEXT DRAFT, so will dispose of my few remaining brood sows; several young pigs and herd boar. Herd boar by Big Long Jumbo (227939), out of Black Big Bone Princess (589850). HOLSTEIN BULLS and bull calves from A. R. O. cows. C. A. Miller, Ripon.

REGISTERED HOLSTEIN CATTLE—E. E Freeman, Route B, Modesto, Cal.

REGISTERED HOLSTEINS—Best blood lines of the breed. R. L. Holmes, Modesto, Cal.

EL DORADO HERD OF HOLSTEINS — Alex. Whaley, Tulare, Cal.

HENGERVELD DE KOL BLOOD. High producers. T. B. King, Visalia.

REGISTERED HOLSTEINS—Bull calves Joseph Paxton, Breeder, Athlone, Cal.

Jerseys.

FOR SALE—Four-year-old registered Jersey bull, a direct descendant (25 per cent) of King's Valet, Imp. (No. 79143), and a very beautiful animal, with many records behind him. Chas. Nelson, Elk Grove, Cal.

SUNSHINE FARM JERSEYS—Young bull ready for light service, for sale. E. E. Greenough, Merced, Cal.

REGISTERED JERSEYS—Young bulls and bull calves. T. B. Purvine, Petaluma, Cal.

REGISTERED JERSEY CALVES and bred heifers. O. J. Ames, Oakdale.

YOUNG BULLS from Register of Merit cows. W. G. Gurnett, Orland, Cal.

Guernseys.

FOR SALE—Two registered Guernsey bulls. Prices reasonable. Papers furnished on application. Also some nice Jersey-Duroc hogs; good foundation stock. Address, Shore Acres Dairy, San Leandro, Cal.

EDGEMOOR FARM GUERNSEYS — First in the show ring and in official records. Few animals of either sex for sale. Edgemoor Farm, Santee, Cal.

HIDDEN VALLEY FARM—Offers for sale a young registered Guernsey bull and six high-grade Guernsey heifers, five of which are already bred. A. J. Welch, Prop., Redwood City.

PALO ALTO STOCK FARM, Palo Alto—Breeders of registered Guernseys; both sexes; prices reasonable.

CLAREMONT GUERNSEYS—Young bulls of serviceable age from A. R. dams. L. D. Smith, R. D., Berkeley.

FOR SALE—Guernsey Bull Raymonds St. Saviours Prince No. 41396. M. Dye, Visalia, Cal.

Ayrshires.

NORABEL FARM AYRSHIRES—Purebred young stock for sale at reasonable prices. Le Baron Estate Company, Valley Ford, Cal.

AYRSHIRES—Registered; all ages. E. B. McFarland, 412 Claus Spreckels Building, San Francisco.

MILKING SHORTHORNS.

BREEDERS OF REGISTERED SHORTHORNS—Milk strain; choice young stock for sale. John Lynch Ranch, Box 321, Petaluma.

INNISFAIL DAIRY SHORTHORNS—Registered young bulls for sale. Alexander & Kellogg, Suisun, Cal.

BEEF CATTLE.

ALAMO HERD REGISTERED HEREFORDS (founded by Governor Sparks). Herd and range bulls. Reasonable prices. W. D. Duke, Likely, Modoc county, Cal.

FOR SALE—Two thoroughbred registered Hereford range bulls. Offspring from these animals show exceptional qualities. Price, $250 apiece. Bryan-Bernard Cattle Co., Napa, Cal.

REGISTERED YEARLING SHORTHORN Bulls—Heavy-boned, thick-meated Scotch and Scotch-topped breeding. Ormondale Co., Route 1, Redwood City, Cal.

RANCHO SAN JULIAN SHORTHORNS—Purebred range bulls, unregistered, for sale Estate Thos. B. Dibblee, Santa Barbara or Lompoc, Cal. John Troup, Supt.

REG. SHORTHORNS—Calves and yearlings for sale, both sexes, reds and roans. Choice Goods breeding. Fair Oaks Ranch, Willits, Cal.

THE NEVADA HEREFORD RANCH, Jno. H. Cazier & Son Co., props., Wells, Nevada. Registered Hereford cattle. Breeding stock for sale.

REGISTERED MILK AND BEEF SHORTHORNS, bulls and heifers for sale; catalog free. Thomas Harrison, Glen Ellen, Cal.

SPRINGDALE STOCK FARM — Choice Shorthorns, bred for size and quality. W. O. Short, Reno, Nevada.

JACK LONDON RANCH—Breeders of prize-winning beef Shorthorns. Glen Ellen, Cal Eliza Shepard, Supt.

MISSION HEREFORD FARM—J. A. Bunting, Mission San Jose, Cal. Registered Herefords.

HOPLAND STOCK FARM—Registered Shorthorns. Prices on application. Hopland, Cal

REGISTERED HEREFORDS—H. H. Gable, Diamond G Ranch, Esparto, Cal.

SIMON NEWMAN CO., breeders of Registered Herefords, Newman, Cal.

GEORGE WATTERSON—Breeder Registered Herefords, Bishop, Cal.

SHORTHORNS — Carruthers Farms, Live Oak, Cal.

SHEEP AND GOATS.

F. A. MECHAM ESTATE, Petaluma, Cal.—Breeders and importers of Shropshire, Rambouillets and American Merinos, both sexes. Also Red Polled cattle. Take electric car at Petaluma or Santa Rosa for Live Oak Ranch

J. R. BLOOM, breeder of purebred Shropshire rams. Single or carload lots. Call on or write to J. R. Bloom, Dixon, Cal.

300 HEAD young sheep for sale. Bred for December lambing. Also Collie dogs for herding. John G. Mee, St. Helena, Cal.

DORSETS AND ROMNEYS — Dorset ram lambs for sale. John E. Marble, South Pasadena, Cal.

FOR SALE—One 18-month-old Toggenberg Billy, one 4-month Toggenberg Billy. L. Skadsheim, Winton, Cal.

BISHOP BROS., SAN RAMON, CAL. — Breeders and importers Shropshires.

KAUPKE BROS., WOODLAND, CAL. — Breeders and importers of Hampshire sheep

CHAS. KIMBLE—Breeder and importer of Rambouillets, Hanford, Cal.

CALLA GROVE FARM, MANTECA, CAL.—Breeders, importers of Hampshire sheep

25 CHOICE purebred Rambouillet bucks for sale. Alfred Kuhn, Henleyville, Cal.

HORSES.

FOR SALE—Seven head of well broken Norman horses weighing from 1500 to 1700 lbs., with harness complete, at reasonable prices. Apply or write to L. M. Edwards, Wheatland, Cal.

MISCELLANEOUS.

BUTTE CITY RANCH—Shorthorns, Shropshires, Berkshires and Shetland ponies. Write for prices and descriptions before buying. Butte City Ranch, Box P, Butte City, Glenn county, Cal. W. T. Dwyer and W. S. Guilford, owners.

MULE FOOT HOGS, large type; booking orders for spring litters. These are the farmers' easy feeding, profit-producing kind. H. T. Bailey, Box 37, Lodi, California. "The Blue Gums"

CROLEY'S BALANCED DAIRY FEED—The cheap milk producer; and Croley's Calf Meal, the best California calf raiser. Geo. H. Croley Co., Inc., Eighth and Townsend streets, San Francisco, Cal.

Poultry for Profit

By Susan Swaysgood, Pomona.

GREEN FEEDS.

This is the time to start that garden of poultry greens, if it is not already planted. The northern part of the State has had rain to start things growing, and in the south we nearly all have irrigating water, so that both north and south should now set out a supply of green feed. Giant mustard, as I have told you before, is the very best winter greens I know of, but if you can plant a variety so much the better. Green feed is a great help in making smaller feed bills; besides, it brings better returns, keeps your flock healthy, and cleans the ground.

Those who happen to have a good big patch of mangels are in luck, too, for they are a valuable feed just now. If they can be cut up with a root cutter, so much the better. But just split in two and placed split side up in the yards, the hens will eat the last bit. Kale will be good for a couple of months yet, and about February it will be time to start the hotbeds to get more plants ready. Kale plants can be made to yield a fair crop along till April or May, but they will go to seed then in spite of all you can do, and that is too late to put in fresh plants, so that, all things considered, it is best to put in the new plants before the old ones go to seed.

HANDLING THE YOUNG CHICKS.

Quite a few have written me that they were either hatching chicks or buying just hatched chicks, so that we expect things will be moving a little. To those who are buying I want to say be careful about feeding the first few days. When chicks have been taken out of the warm incubator and sent by express they should be fed very lightly for a few days and not given feed and water indiscriminately.

RECEIVING YOUNG CHICKS.

If the chicks arrive in the morning or about midday, put them in the warm place provided for them and sprinkle a little ground oyster shell on the boards. This with a dish of water that has had the chill taken off is all they should be served until they have had time to move around a little. Towards evening sprinkle a little dry chick feed or ground toasted bread for them to pick at, just what they will clean up before going under the hover, and don't be afraid they will die of want, for every chick that absorbs the yolk has enough food to last it several days. I have heard of them being shut up in a barrel for eleven days without food and coming out strong. The greatest trouble with beginners is that they feed too much and too often. For the first ten days great care should be given to both the feeding and

HOVERING OF FALL-HATCHED CHICKS.

Take time to teach the chicks where to go to warm up, and if you teach them to understand at first the question will never need be asked, "Why do my chicks huddle up in little bunches?" They huddle up because they have not learned where to run to get warmed up when the morning is chilly, so they get together and try to warm each other. That is the one fault I have to find with fireless brooders. After the chicks leave them in the morning, they soon get that cold, damp feeling that one's clothes have that have been laid across a chair during the night and a little fog has crept in and settled on them. When they touch the skin they don't feel any too inviting. We know the clothes will soon warm up, but the chicks are not so wise, so they don't run back to the hover to get warmed up as they would if there were a smell of something warm.

I always turned up the brooder lamp in the early morning so that, instead of the brooder being colder, it was warmer and more inviting to the chicks.

SAN FRANCISCO POULTRY ASSOCIATION MEETS OCTOBER 9.

The San Francisco Poultry Association, in co-operation with the Food Administration, will hold a meeting on October 9 in the lecture hall of the Phelan building, 760 Market street, San Francisco. Doors will be open at 7:30 p. m. Everyone interested in the food problem is invited to attend. The chief object of the meeting is to encourage city-lot poultry culture. The Food Administration will demonstrate the real necessity for increased attention to this war-time aid to meat production, and experienced poultry keepers will give practical advice for the benefit of beginners in this branch of agriculture. Attention will also be directed to the poultry show of the association that is to be held in connection with the International Livestock Show, November 2-10. The following poultry judges have been engaged: For Standard classes, C. G. Hinds and W. S. Russell; and for Utility, L. W. Potts. Many letters of encouragement have been received from well-known breeders, in which they mention their intention to enter a number of fowls for our coming show. Entries will close October 15, and entry blanks will be mailed on or about October 1.

MORE AND BETTER POULTRY AT ORLAND.

The poultry show at the Orland Fair was largely local and therefore in its improvement over last year reflected the development of the industry in that district. Nearly 400 birds were shown, and attracted interested crowds. The farmers' favorites, White Leghorns, Barred Rocks and Rhode Island Reds, were the largest classes. There were small showings of White Wyandottes, Buff and Brown Leghorns, White and Black Minorcas, Buff and White Orpingtons, Silver Bright Bantams, and Golden and White Cochins. There were also some good rabbits, pea fowl, guinea fowl, ducks, geese and turkeys.

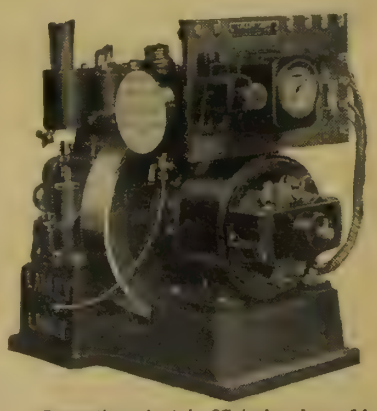
Satisfaction Assured in Advance



Generating plant is 27 inches long, 14 inches wide, 21 inches high. Storage battery is included in complete outfit.

It is a fact that Lalley-Light usually finds preference among those thoughtful farmers who are regarded as neighborhood leaders. It is not hard to understand why. The man who seriously looks into the electric light situation discovers that Lalley-Light has been in successful farm use for more than seven years.

He hears it well spoken of everywhere it is known.

He learns that faithful, year-to-year service and economy are the experience of Lalley-Light users.

He receives the impression that he would be entirely safe in investing in Lalley-Light.

He accepts these things as actual advance assurance of his own future satisfaction.

In reality, they are exactly that. For Lalley-Light satisfaction probably approaches 100 per cent as closely as it can be approached.

Never was the need for Lalley-Light so imperative as now.

Farm labor is scarce. Lalley-Light saves labor by supplying the power to do much necessary work.

Farm products and farm buildings are more valuable. Lalley-Light safeguards them by removing the fire risk entirely.

Lalley-Light brings to the farm a score of conveniences and comforts that only electricity from a wholly dependable plant can bring.

In addition, it has its own exclusive advantages, which the nearest Lalley-Light dealer will gladly demonstrate and explain.

Write us for his name, and for complete details.

Look for the Lalley-Light demonstrating exhibit at your state or county fair this fall.

LALLEY-LIGHT

THE ELECTRIC LIGHT AND POWER FOR EVERY FARM

HOME CIRCLE

THE COMING DAY.

Unfurled to breeze beyond the seas
Old Glory greets the eye,
Not empire's lust but people's trust
Its starry folds imply.

For noble ends our land contends,
God bless the soldier lad!
Let freedom's might enforce the right,
The common heart make glad.

Heaven speed the day when all array
Of war's grim power shall cease,
When everywhere sea, earth, and air
Shall chant the lay of peace.

Then shall good-will all spirits fill
To bless the sons of men,
And earth shall hear through welkin clear
The angels' song again.
—George Croswell Cressey, D. D.

THE PAYNE FAMILY'S BLACK-MARK PAPER.

The Payne family was holding a council on the porch after supper. Father Payne sat in his big chair and smoked his pipe thoughtfully; mother Payne darned stockings and considered gravely the matter under discussion; sixteen-year-old Elizabeth hulled strawberries for breakfast in as grave a manner as one could use toward strawberries; and Margaret, who was the oldest and just home from college, stood against a piazza post and tapped her foot impatiently.

Perhaps, however, it is hardly fair to state that the entire family was gathered together in council. Three were absent. These were William, Paul, and Robert—aged respectively fourteen, twelve, and ten years. Frequent shrieks from the stable, where an impromptu circus was in progress, gave conclusive evidence of their whereabouts. It was just as well that they were absent, as they were the subject of the discussion on the porch.

"I really don't know what to do about it," mother was saying. "If I keep at them too much, I'll develop into a nagger, and that will never do!"

"Never!" said father, emphatically. "Better be anything than that! Still something must be done. If they keep on this way, they'll be handicapped all through life. I hoped high school would help Billy, but it hasn't."

"He is some better, dear," encouraged mother.

"It's the association," explained Elizabeth, from her corner. "Just so long as they have circuses with Jimmy Brown, who says 'hain't got no' every time he opens his mouth"—

"But, Elizabeth," remonstrated her father, gently, "you know we've gone all over the subject of association. The boys must run up against all kinds of boys and men, and learn to discriminate. Better listen to bad English than to inculcate snobbishness. Only I wish we could somehow make them acquire a real enthusiasm for correct speech. I don't like this constant correcting from every other member of the family. As mother says, it savors too much of nagging. Margaret," he finished, looking at the tall girl by the post, "I guess it's up to you. Can't college help you out?"

"It has already, dad," answered Margaret, thoughtfully. "I think I'm on the right track. I got the idea from a funny bulletin-board we had in the house last year at school, but I think it will work out here. No one's to know until tomorrow morning. Only, dad," she called back as she hurried into the house to make preparations for her mysterious scheme, "you'll have to promise to be Lord High Treasurer, for there are rewards in this idea of mine. I thought of gilt stars, but those would never do for Billy and Paul and Bob. You will accept the position, won't you?"

"Depend upon me," said the Lord High Treasurer. "I'm already installed."

The next morning the mystified and interested Payne family examined a large sheet of clean white wrapping-paper on the dining-room wall. On its left side were written perpendicularly the names of the entire family—father, mother, Margaret, Elizabeth, Billy, Paul, Bob. Opposite each name and far across the paper extended innumerable small squares. A well-sharpened pencil attached to a string dangled from a tack above the paper.

The curious Billy, Paul, and Bob refused to eat their cereal before the mystery should be explained, and loudly called Margaret until she came from the study where she and her father had withdrawn for private consultation. Billy looked on somewhat disdainfully while his sister explained the paper and its mission. It seemed rather too much like school to him, but his attention instantly improved when Elizabeth quietly whispered in one ear that it might possibly have something to do with new fishing-tackle.

"All ordinary mistakes — bad enough but not terrible—like 'it's me' and 'hadn't ought' and 'you was' will count each of us his age for every time used," explained Margaret, adding footnotes to the paper on the wall. "For instance, Billy, if dad says 'you was,' it goes into this first little square against him, and he loses forty-five. The same with mother. I'd lose twenty-two, Bobby ten, and so on. But there are two exceptions. 'Ain't' or 'ain't got no' costs ten extra. That makes twenty-four for you, Billy, you see, and fifty-five for dad or mother."

A roar from the boys at the thought of dad or mother saying "ain't got no."

"What about 'hain't?" asked Paul.

"It ought to count more," answered the manager, thoughtfully, "but I guess we'll make it count the same as its awful twin."

"Does slang count?" asked the still skeptical Billy.

"Not at present," said his sister. "Rome wasn't built in a day."

"And now," finished the Lord High Treasurer, "I'll name the rewards. They will be made the first day of August—six weeks from now. Every member of this family who has not more than five hundred against him on August 1st has his or her choice of the following articles." He consulted a paper. "A new gown, two new books, an air rifle, a new fishing-rod and flies, a league baseball, some new wireless apparatus, some new boxing gloves, a sweater, a sled, some skates, or any other article much desired and not too expensive."

"Well," said Billy, "that's all right, dad, but where do you and mother come in? Near as I can figure, you're the only ones that have a ghost of a chance, except perhaps Margaret and Elizabeth, and you a—I mean haven't named a thing four yourselves."

The Lord High Treasurer looked at mother and then crossed to her seat at the table.

"I've got to admit, Billy, that I forgot all about mother and me," he said, "but I know now. If mother and I win out, we'll go on a second honeymoon."

"Ugh!" said Billy.

So the contest for correct English in the Payne family began, and so it continued throughout the summer. Honest Margaret filled the little squares and each night tabulated their contents. It was wonderful how Billy and Paul and Bobby Payne set a guard upon their lips, and equally wonderful how critical they became of every word which fell from their parents' and their sisters' mouths. Never will Billy Payne forget the day when his college-bred sistes said "those kind" at the dinner-table, and he knocked over two chairs in his effort to get to the paper and write it in the square opposite her name. "Ain't" disappeared from the family circle, and its hated twin was seen no more.

By July 25 Billy, with 416 against him, spoke more circumspectly than ever, and finally talked no more than was absolutely necessary. By July 31 he was jubilantly inspecting new fishing-tackle, while his younger brothers were trying to decide between boxing gloves and an air rifle.

The morning of August 1 found father and mother Payne packing their grips for the second honeymoon. That same day at lunch Bobby came to the table late but wholly amused.

"What do you think, Margaret?" he cried. "Jim Brown's mother has a black-mark paper for the Brown family over the kitchen-table, and Jim's working for squirrel traps!"

"Well," said Margaret, after Bob's information had been thoroughly commented on, "it's August and we've all won out, so I suppose the paper had better come down."

"No, sir," cried Billy, "I say keep it up till Christmas anyway. It's not half bad, after all!"—Mary Ellen Chase in the Christian Register.

Long Before TRACTORS Were Made—

Barker Bros. were helping to make homes happier all over the Great Southland.

In those days no one was any the more appreciative of a comfortable home than the man who followed the plow.

Doubtless few today are more appreciative of their homes than the man who rides the tractor all day long.

Do Not Delay the Purchase Of A Piano Too Long

Owing to difficulty in obtaining raw materials and labor, and the rising costs of both, piano manufacturers raised their prices to us several times in the past year and a half—we were forced to raise our prices accordingly. The manufacturers now warn us that, as their production has been cut down by the War Industries Board to a small fraction of their original output, they cannot manufacture pianos on a quantity basis and sell at a quantity price—that the prices of the small number of pianos they will be permitted to make will soon increase enormously.

In fairness to our customers and friends, whose good will we value above all else, we issue the warning—**purchase now (in the next month) if you want a Piano**—otherwise those in moderate or even comfortable circumstances must defer the purchase of a Piano for several years until the greatly increased prices go down because of a return to normal manufacturing conditions.

We invite you to call at any of our stores — or write us asking for illustrated catalogues and prices.

We are dealers in Steinway and other Pianos, Pianola Pianos, Aeolian Player Pianos, Player Music, etc.

Working in the Open— Without Chimney

Did you see our Demonstration at the Tractor Show? We certainly hope you had an opportunity of witnessing the proof of our claims regarding a clean, useful, oil-gas fire without draught operation.

Out in the open of the big tent, with no chimney, but two pieces of pipe and an elbow where you could watch clean heat, instead of smoke, coming out.

With lid off and front and side doors of stove opened and closed by spectators as they pleased, the burner worked steadily on with never a blink.

If you were not at the show and are interested in real fuel thrift, write for circular "B."

The burner works anywhere, in any stove without any changes, making real gas, clean heat from common kerosene.

PARCEL POST, PREPAID—$5.00.

PREMIER BURNER CO., 246 So. Spring St.

Agricultural Summary

An Unprecedented Cattle Market.

Receipts of cattle on the Chicago market for the month of August were the largest of any year since 1910, yet prices were not only the highest on record for August but some classes made new high records for any time. The marketward movement from some sections was swelled by drouth-enforced liquidation, while the unprecedented prices proved another strong magnet in attracting supplies to market centers. Receipts locally included approximately 60,000 western range cattle, the largest August receipts of this class for nine years. It was in quantity, however, rather than in quality or condition that the month's receipts excelled. The supply, while yielding a big quota of cattle of suitable weight and flesh condition for Government contract beef, contained probably the smallest proportion of choice and prime corn-fed cattle included in a run of similar volume for years. Top hogs, touching $20.30 at the close of the month, sold 30c above the former yard record, scored in August, 1917, and stood $8.75 per cwt. above the highest price ever recorded prior to last year.

The Boom in Butter.

It is on—and has been for some time. It is now above the 60c mark and is still rising in the price thermometer. The rise is simply the result of the operation of the law of supply and demand. Current production is entirely inadequate to meet consumptive demand, and storage stocks, both here and in the East are being drawn upon heavily. Furthermore, Uncle Sam has commandeered 60 per cent of the storage stocks. All this makes the prospect look roseate to the dairyman, despite the difficulties of scarce feed and a lessened labor supply.

New Crop Limas, 12c.

After a careful inspection of the lima bean fields in all directions, the California Lima Bean Growers' Association is making its first offering of the 1918 crop at 12c a pound. Prices on future sales, it is announced, will be ruled by the law of supply and demand. The lima bean yield will average normal. The Los Angeles Chamber of Commerce estimates the Southern California bean crop at 9,000,000 bushels, with a value of $40,000,000. California grows nearly half the beans produced in the United States.

Government to Control Cotton.

Steps looking to the fixing of prices for standard grades of raw cotton have been taken by the Government in the naming of two committees—one to investigate the entire cotton situation and the other to control during the period of this inquiry the distribution of cotton by purchasing all of the staple needed by the United States and the allies at prices to be approved by the President.

East Eager for California Grapes.

Fresno grapes are bringing good prices in Eastern cities this season. Last week some shipments of Malagas brought from $2,300 to $2,500 a car in New York and Philadelphia, and from $1,500 to $2,100 at points further west. The damage done by the recent rains has resulted in a serious shortage of shipments, with the usual effect on prices.

A Hog Top Price of $20.90.

The Chicago top price of $20.90 on hogs reached this month is the highest on record in that market. It is interesting to note that the highest prices reached by hogs on the Chicago market for the past six years have been in August, September, or October, when the new crop hogs are barely ready for the market and the old crop is mostly in.

Help Sought for Barley Growers.

Representatives of California barley growers have arranged a conference with U. S. Food Administrator Hoover to devise ways and means for the sale of the State's surplus of 750,000 tons of barley.

THE MARKET REPORTS

Figures Given are Independent and Reliable.
Prices Quoted as Paid to Producers.

SAN FRANCISCO

San Francisco, Sept. 25, 1918.

WHEAT.

Wheat is selling at the prices announced by the Federal Grain Corporation, and these prices will doubtless be maintained for the present crop. The prices quoted are for grain f. o. b. San Francisco, Los Angeles, Seattle, Tacoma and Portland, and guaranteed at least $2 per bushel f. o. b. shipping point. The price of sacks and sacking not included.

No. 1 hard	$2.20
No. 2	2.17
No. 3	2.13
No. 1 soft	2.18
No. 2	2.15
No. 3	2.11
Club or Sonora, No. 1	2.16
do, No. 2	2.13
do, No. 2	2.09

BARLEY.

Buyers believe that barley will be cheaper and are not offering more than $2.15 and $2.20. Some small sales are reported at the latter figure.

Choice feed, per ctl	$2.15@2.20

OATS.

There was little demand for oats this week and the market was weaker in sympathy with barley.

Red feed, per ctl	$2.50@2.55
Red seed	2.90@3.10

CORN.

Corn is nominally unchanged. The only corn on this market at present is Egyptian. (First-hand prices on strictly first-class grain, San Francisco.)

California sacked	$4.20@4.25
Milo maize	3.95@4.05
Egyptian	4.05@4.10

HAY.

Receipts of hay for the past week were only 670 tons against 1331 tons the previous week. The heavy decrease is accounted for by the heavy rains of the previous week. This rain went through piles of baled hay from top to bottom and rendered most of it practically valueless. Even with these small receipts there is no demand on this market, every one seeming to have as much hay as they require for the present.

Wheat No. 1	$23.00@25.00
do, No. 2	20.00@22.00
Choice tame oat	24.00@26.00
Wild oat, new	19.00@23.00
Barley, new	19.00@23.00
Alfalfa, first cutting	16.00@20.00
do, second cutting	22.00@24.00
Stock	18.00@21.00
Barley straw	50@80c

FEEDSTUFFS.

Rolled barley and rolled oats were weaker this week in sympathy with the weakness of the whole grain and the prospect of early range feed.

New alfalfa meal, per ton	$33.00@34.00
Coconut cake or meal	45.50
Cracked corn	86.00@88.00
Oilcake	78.00
Rolled barley	49.00@50.00
Rolled oats	57.00@58.00
Bran, carload lots in S. F.	23.75
Mixed feed, do, do	25.00
Middlings, do, do	25.75

POTATOES, ONIONS, ETC.

The vegetable market has resumed almost its normal condition after the rains and most descriptions have been benefited by the wetting. Potatoes and onions are unchanged in price although sweet potatoes are somewhat lower. Lettuce this week is selling by the dozen head instead of crate. Green corn is almost off the market and practically all coming in is of very poor quality. Celery was plentiful this week, with very little demand. Cucumbers are lower.

Peas	7@9c
String beans	5@8c
Garden beans	7@8c
Wax beans, per lb.	5@6c
Carrots, per sack	75@85c
Rhubarb, San Jose, per box	$1.00@1.25
Summer squash	75c@$1.00
Cucumbers (hothouse), per box	None
do, Alameda, lugs	60@75c
Eggplant, per box	75c@$1.00
Lettuce, Sacramento, doz	15@25c
Celery, bunch	20@25c
Tomatoes, per crate—	
Merced	Nominal
Bay	$1.25@1.50
Potatoes—	
Garnet Chile, on street	None
Whites	$2.25@2.50
Sweets, per lb.	4c
Onions—	
River Reds	None
Yellows	$1.50@1.75
Australian Browns	1.50@1.75
Garlic, new	16c
Green corn, Alameda, per sack	Nominal
Okra	5@7c

BEANS.

The old crop is being cleaned up better than was anticipated and probably nearly all of it will be sold by the time the new crop is ready for market.

Bayos, per ctl	$ 7.25@ 7.50
Blackeyes	6.75@ 7.00
Cranberry beans	10.25@10.50
Limas (south, recleaned)	12.00
Pinks	7.10@ 7.30
Red kidneys	Nominal
Mexican Reds	7.25@ 7.40
Tepary beans	7.50@ 8.50
Garbanzos	8.00@ 8.75

POULTRY.

The market is easier on hens, fryers and young roosters, although it is stronger on some other descriptions, especially on squabs.

Turkeys, live, young spring, lb	36@37c
do, old	32@33c
do, dressed, old	34@38c
Broilers, 1½ to 2 lbs	39@42c
do, 1¼ lbs	45c
do, ¾ to 1¼ lbs	47c
Fryers	37@38c
Hens, extra, per lb., colored	36c
do, Leghorn	32c
Smooth young roosters, per lb. (3 lbs. and over)	38c
Old roosters, colored, per lb	24c
Geese, young, per lb	27@28c
do, old, per lb	25c
Squabs, per lb.	50@52c
Ducks	29@30c
do, old	25@27c

BUTTER.

Extra butter passed the 60c mark this week, going to 63c on Monday. Later it receded to 61½c and was strong at that point. Prime firsts touched 56c, but immediately receded to 55c. The exchange adopted a new scale of commissions on butter, which went into effect September 24, as follows:

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extra	60	60	62	63	61½	61½
Prime 1st	55	55	55	55	55	55
Firsts	Nominal					

EGGS.

Eggs, both extras and extra pullets, took a somewhat sensational drop last Thursday, but they developed strength the next day and extras closed the week at the highest price of the season. The cause of the drop is said to have been a temporary overstock in this market.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	58	58½	59½	60½	61½	63
Extra 1sts	Nominal					
Firsts	Nominal					
Extra pullets	51½	51½	52	52	54½	55½
Market Price						Discount
Up to 46½						6 %
From 47 to 50						7½%
50½ to 53½						7 %
54 to 57½						6½%
58 to 62½						6 %
63 to 68						5½%
68 to 75						5 %
75½ to 83						4½%
83½ to 93½						4 %

CHEESE.

Outside of California flats, which showed weakness, the cheese market was strong this week, with advances scored on Cheddars and Oregon triplets.

California Cheddar, flats, fancy	30½c
Fancy California flats, per lb	30½c
First California flats, per lb	28c
California Y. A. fancy	31c
Oregon triplets, fancy	32½c
Oregon Y. A. fancy	30½c
Monterey cheese	24@27c

FRESH FRUITS.

Cantaloupes are about finished. The stock on the market is poor and practically without demand. Grapes and apples continue to be the leaders, with a standard price of from $1 to $1.25 for the first. Berries have not yet recovered, although there are quite a few shipments of strawberries being made.

Apples	$1.50@2.50
Peaches, 4-box crate	.75@1.25
Figs, black, per box	None
do, double layer	$1.00@1.25
do, Single Row Whites	75c@$1.00
Strawberries, per chest	$7.00@10.00
Blackberries, per chest	Nominal
Raspberries, per chest	$8.00@10.00
Plums	$1.00@1.50
Cantaloupes, flats	None
do, ponies	$1.00@1.25
do, standard	1.25@1.50
Watermelons, per lb	1@1½c
Pears, Bartlett, per box	$1.50@2.50
Grapes, seedless	$1.25
do, Malaga	$1.00@1.25
do, Fontainbleu	None
do, Tokay	$1.00@1.25
do, Isabella	1.00@1.25
Persimmons	1.25@1.50
Alligator Pears	3.00@3.50

CITRUS FRUITS.

Oranges and grapefruit continue strong with higher prices demanded for the latter. Lemons are still weak.

Oranges	$7.50@8.50
Lemons, fancy	4.50@5.50
do, choice	3.50@4.00
do, standard	3.00@4.00
Grapefruit	5.50@7.00

DRIED FRUITS.

The loss by the recent rains is creating a heavier demand for other dried fruits and those whose prices have not been fixed by the Government. These are being firmly held. Last week's prices still stand.

Apples	13@14c
Pears	11@14c
Prunes, graded, price to growers:	
gain in dip	11c
Prunes, graded, prices to growers:

RICE.

Paddy rice, 1918 crop	$4.32
Clear No. 1, 1918 crop at mill	7.00

HONEY.

The honey crop of this State is pretty well cleaned up, but the warm weather following the recent rain may induce the bees to collect more honey. If they do, the additional honey will doubtless sell at lower prices. Dealers believe the exportation of honey is over for the present year.

HIDES.

Taken off Aug. 1 to Sept. 1, all weights: No. 1, 19c; No. 2, 17c; No. 3, 16c; bulls and stags, No. 1, 15c; No. 2, 13c; kips, No. 1, 21c; No. 2, 19c; calf, 31@33c.

Horse—Dry, per lb.: No. 7, large, $2.25@2.50; medium, $1.75@2.35; small, $1@1.50.

Special Deciduous Market Report

By J. L. Nagle.

Sacramento, Sept. 24, 1918.

There was a noticeable advance on grapes of all varieties this past week, in practically all markets, each succeeding day reporting a higher market. Condition on arrival seems to be overlooked. The damage to the Tokay crop confirms the estimate of last week and probably in the Lodi district will exceed 50 per cent. To date, rain-damaged stock has not appeared upon the market and it is problematical as to how it will be accepted by the trade. If berries give any evidence of keeping quality, the fruit will not affect the market, but if badly decayed, we predict will hardly pay freight charges, though we do not look for any serious effect upon sound stock, but any quantity of this rain damaged stock may temporarily effect the market.

The Bartlett pear market was a big surprise good stock selling freely at $4.00 and better; some cars of fancy grades from the Tehachapi selling in excess of $5.00.

The railroad and terminal congestion in the Eastern markets that affected deliveries a week ago, has been greatly relieved and stock is now moving with practically no interference.

There is quite a demand for wine grapes in most of the markets, but some of the stock is showing up wasty and hardly bringing freight charges. Berries, any portion of which can be made into wine, are selling at prices that are netting the growers from $50.00 to $75.00 a ton.

Practically all deciduous fruits are cleaned up, with the exception of late clings, which have met with a surprisingly strong demand and though only a small proportion of the crop has been packed for Eastern shipment, a sufficient amount has arrived in the East to indicate that the trade was in a position and ready to take care of a large block, to good advantage.

The light supply of Tokays has had a tendency to boost prices for Malagas. The stock is arriving in most cases in very fine condition. About 80 per cent of the crop has been harvested and what is yet to be shipped, if not affected by later rains, ought to sell at prices equal to Tokays.

The Emperor season has opened with a very sharp demand. About 50 per cent of the crop will be packed in sawdust and the balance in crates and lugs. The stock is of good color and of excellent quality. We anticipate a sharp demand throughout the season.

Following are the averages for the week: New York: Pears—Bartlett, $1.20; Winter Nellis, $2.75; B. Hardy, $3.63; B. Clairgeau, $3.62. Peaches—Phillip Cling, $1.82; Salway, $1.92; Levi, $2.52. Grapes—Malaga, $2.15; Tokay, $2.40; Muscat, $1.88; Black Prince, $1.49; Cornichon, $1.77; Alicante Bouchet, $2.06; Zinfandel, $1.58.

Boston: Peaches—Phillip Cling, $1.40; Salway, $1.79; Levi, $2.05. Pears—Bartlett, $3.67; B. Hardy, $3.50; B. Clairgeau, $4.00. Grapes—Tokay, $2.62; Muscat, $2.02; Malaga, $2.26; Cornichon, $2.37. Plums—Kelsey, $2.02; President, $2.65; Gros, $2.07; Grand Duke, $2.45.

Chicago: Grapes—Malaga, $2.01; Zinfandel, $1.32; Alicante Bouchet, $1.50; Tokay, $2.13; Rose Peru, $1.35; Muscat, $1.44. Pears—Bartlett, $3.90; B. Hardy, $2.90; Heath Cling, $1.30; Phillips, $1.55; Levi, $1.80.

Total shipments, by cars, from August 13th to 20th, inclusive: 21 peaches, 32 pears, 1317 grapes. Total shipments to date, 1918, 15,421 cars. Total shipments to date, 1917, 14,268 cars.

Special Citrus Market Report

San Francisco, Sept. 25, 1918.

In the East, California Valencias are in strong demand, and the supply is insufficient for trade requirements. Sizes 200 and larger are bringing premium prices. The best grades are selling at $8.95 to $10.50, choice at $8.05 to $9.75, and standards down to $6.50 a box. At California shipping points the market is on a basis of $7.50 to $7.75. Holdings are being closed out so that Valencias will be out of the way when the Central California Navel crop comes on in November.

The lemon market, which was down, shows some improvement, but it pays to ship the better grades only. The foreign stock arriving in New York has been too long in transit and only a fraction of the shipments is fit to be put on the market.

The total shipments from California for the year are: Oranges, 16,432 carloads; lemons, 5,588 carloads. Last year to date they were: Oranges, 14,182 carloads, and lemons, 7,604 carloads.

LOS ANGELES

Los Angeles, Sept. 24, 1918.

BUTTER.

There has been another sharp advance in this market since our last review. Receipts continue light, only 248,800 pounds for the week against 295,700 pounds the same week last year. Current receipts are now running lighter than the requirements of the trade and this, coupled with an advance of 3½c on extras in Chicago and 4c in New York, caused an advance here on extras up to Monday of 4c, and not much to be had at this advance.

We quote:

California extra creamery.....58c
do, prime first.....56c
do, first.....55c

Daily quotations—

1918—	Tu.	Wed.	Thu.	Fri.	Sat.	Mon.
Extra	54	54	55	58	58	58
1917—						
Extra	44	44	44	46	46	46

EGGS:

There was quite a picking up in the receipts the past week, and under better offerings the market broke 2c on extras and 1c on pullets up to Monday. Case count unchanged. Prices had gotten so high as to check consumption. Receipts for the week by rail, 678 cases against 788 cases the same week last year. As the arrivals by truck continue to run about four times as large as the railroad receipts, the supply for the week was 3390 cases against 3940 cases the same week last year.

Daily quotations—

1918—	Tu.	Wed.	Thu.	Fri.	Sat.	Mon.
Extra	57	57	55	55	55	55
Case count	54	54	54	54	54	54
Pullets	51	51	51	51	51	50
1917—						
Extra	48	48	49	49	49	50
Case count	47	47	47	47	47	47
Pullets	40	39	40	40	40	40

POULTRY.

There is no change in this market from a week ago. Receipts continue light and so is the demand.

The following prices were agreed upon last Friday, September 20, and hold good until the coming Friday:

Broilers, 1@1¼ lbs.....35c
Broilers, 1½@1¾ lbs.....35c
Fryers, 2@3 lbs.....31c
Roasters (soft bone), 3 lbs. and up....31c
Stags and old roosters, lb.....20c
Hens.....24@31c
Tom turkeys.....32@35c
Ducks.....22@28c
Geese.....15c

VEGETABLES.

Potatoes were a little firmer the past week under lighter receipts, and demand is good. Onions in good supply; slow of sale and lower. Cabbage steady but dull. Tomatoes were in good demand. String beans and lima beans steady. Bell and Chile peppers slow of sale, but market is steady.

We quote from growers—

Bell peppers, per lb.....2½@3c
Chile peppers, per lb.....2½@3c
String beans, per lb.....5@6c
Lima beans.....4@5c
Potatoes, local per lug.....75c@$1.00
do, do, per cwt.....$2.00@2.25
do, northern, per cwt.....2.50@2.90
Sweet potatoes, per lb.....2½@3c
Garlic, per lb.....8@9c
Onions—Stockton Yellow Danvers, cwt.....$1.65@1.80
Onions, White Globe, per cwt....1.85@2.15
Onions, Small Bermuda, per crate..80@90c
Cabbage, per 100 lbs.....$2.00@2.25

FRUITS.

Offerings were good, and so was the demand for all fancy stock. Grapes and pears showed most life, though peaches and plums sold very well. Figs steady. Quinces slow sale, but steady. Apples coming in more freely but sales slow.

Figs, Black Spanish, 7-lb. box.....35@50c
do, White, 7-lb. box.....30@50c
Peaches, freestone, per lug.....$1.00@1.25
do, clings, per lug.....1.25@1.50
Pears, local, per lb.....2@3c
Pears, Mountain.....3½@4c
Nectarines, per lb.....4@5c
Grapes—
Malagas, per lb.....2½@3c
do, Muscat, per lb.....2@2½c
do, Liberty, per lb.....2½@3c
do, Rose Peru, per lb.....2½@3c
do, Tokay, per lb.....4@4½c
do, Cornichon.....4@5c
Apples, Bellefleur, 4-tier.....$1.65@1.75
do, 3½-tier.....1.70@1.80
do, Gravenstein, 4-tier.....2.25
do, do, 4½-tier.....2.00
do, Bellefleurs, local, per lb.....2@2½c
Avocado pears, small, per doz...50c@$2.00
do, large, per doz.....$4.00@5.00
Plums, per lb.....5@6c

BERRIES.

There were more strawberries in the past week, and they were slow sale and a little lower. Blackberries rather scarce, steady and in fair demand. Raspberries scarce and higher.

We quote from growers:

Strawberries—
Fancy, per 30-basket crate....$2.00@2.25
Poor to choice, 30-basket crate 1.50@1.65
Blackberries, 30-basket crate.... 2.50@3.00
Raspberries, 30-basket crate..... 3.00@3.50

MELONS.

Market was well supplied the past week with watermelons, and they met with a fair demand at steady prices. Casabas continue to come in freely and were slow of sale and weak. Cantaloupes are in only moderate supply; demand good and market steady. Honeydew melons also sold fairly well.

Cantaloupes—
Tip Top, home-grown standard crate.....$1.15@1.25
do, do, pony crate.....70@80c
do, do, jumbo crate.....$2.50@2.75
Columbia, jumbo crate..... 2.75@3.00
Paul Rose, standard crate.....$1.25
Casabas, per lb.....1½@2c
Pineapple, standard crate.....$1.15@1.25
Watermelons, per 100 lbs..... 1.00@1.25
Honeydew melons, 16-inch crate 1.00@1.10
do, jumbo crate..... 3.25@3.50

HAY.

Not much in the past week and very little wanted. A few cars of alfalfa were taken by the dairy people, but they were the only buyers on the market. No demand for horse hay. The market is the dullest for years. Light receipts, however, prevent a break in prices.

We quote f. o. b. Los Angeles—

Barley hay, per ton.....$24.00@26.00
Oat hay, per ton..... 26.00@28.00
Alfalfa, northern, per ton.... 21.00@22.00
Alfalfa, local, per ton..... 22.00@24.00
Straw, per ton..... 9.00@10.00

BEANS.

There was a fair demand for limas and blackeye beans the past week. All other varieties are neglected.

We quote from growers—

Limas, per cwt.....$11.50
Large white, per cwt..... 10.00
Small white, per cwt..... 10.00
Pink, per cwt..... 7.50
Blackeye, per cwt..... 6.25
Tepary, per cwt..... 8.50

COTTON.

There was less life in this market the past week than for some time. The announcement that the Government had decided to fix the price of cotton and control its distribution took the trade by surprise, and little was done. But with the opening of the current week there was more disposition to take hold. October closed in New York at 31.99c and December at 31.53c. In New Orleans October closed at 30.42c and December at 30.40c.

SERVES YOU RIGHT

It was right after the recent heavy rains Mr. Fox, our horticultural editor, was up in Napa county. He visited a fruit grower who had ten tons of prunes in trays. The weather was threatening and Mr. Fox knew that those prunes needed to be stacked pretty lively. But did he merely advise the farmer what to do? Not much! He knew that labor was scarce, so he pulled off his coat and helped stack those trays.

Not an unusual case, either. Mr. Leachman cried a sale for one of the breed associations at the recent State Fair. Mr. Whitten recently helped a swine breeder immune his hogs when they were threatened with cholera. Why, the different ones on our staff are helping our subscribers constantly, both here in the office and out in the field.

For our men are not theorists and chair-warmers. They are real, practical farmers, with tanned hands and calloused palms. They have worked out personally the very problems you are tussling with, and they are ready and anxious to serve you just as they are serving others.

Why fight your battles alone? Hundreds of farmers have been able to increase their profits through the money-making methods described in our columns, and the advice and help given by our field men. Why not you?

If we haven't covered the problems that are troubling you most, tell us what they are. We will spare neither time, labor nor expense to give you the best possible information or advice on the subject. You will find the Rural Press not a cold, heartless institution, but a personality, warm and sympathetic, which will cheerfully give you "help for every need."

And that's why people swear by the paper. That's why they can't afford to get along without it, no matter how much they find it necessary to economize in other ways.

Special Livestock Market Report

San Francisco, Sept. 25, 1918.

CATTLE—Small lots of cattle continue to be offered in California with a fairly steady market and with cow stuff commanding somewhat better prices. Several shipments of good size arrived from Oregon points. The quality was good, though they were rather light in weight. Nevada also contributed some good cattle this week.

Grass steers—
No. 1, weighing 1000 to 1200 lbs..11½@12c
No. 1, weighing 1200 to 1400 lbs.11½@11¾c
Second quality.....10@10½c
Thin.....8@9c
Cows and heifers—
No. 1.....7½@8c
Second quality.....6½@7c
Common to thin.....4@5c
Bulls and stags—
Good.....6@7c
Fair.....5@6c
Thin.....4@5c
Calves—
Lightweight.....11c
Medium.....10c
Heavy.....8½c

SHEEP—Sheep and lambs are steady, with supply taking care of all demands. Full quotations are paid by the trade.

Lambs—
Yearlings.....12@12½c
Milk.....14@14½c
Sheep—
Wethers.....11½@12c
Ewes.....9@9½c

HOGS—Hogs are coming in more freely than for some time past and the quality of the receipts is much improved.

Hogs—
Hard, grain-fed, 100@140.....18c
do, do, 140@300.....18½c
do, do, 300@400.....18c

DRESSED MEATS.

Steers, No. 1.....20@21c
do, second quality.....19½@20c
Cows and heifers.....16@18c
Calves, as to size, etc.....18@21c
Lambs—
Suckling.....23@25c
Yearling.....21@22c
Sheep—
Wethers.....18@20c
Ewes.....27@28c
Hogs.....27@28c

Los Angeles, Sept. 24, 1918.

CATTLE—Good, fat steers continue scarce, firm, and are wanted at full quotations. A lot of thin and medium stuff is being offered both from California and Arizona, however, and the market for it is dull and weak.

Per cwt. f. o. b. Los Angeles—
Beef steers, 1000 to 1100 lbs.....$9.00@12.00
Prime cows and heifers..... 7.50@ 8.50
Good cows and heifers..... 7.00@ 7.50
Canners, per cwt..... 5.00@ 5.50
Calves, per cwt..... 8.50@ 9.50

HOGS—Few are coming in, but at present high prices killers are taking but few. Fresh pork is so high as to curtail consumption, hence the lighter demand.

Per cwt. f. o. b. Los Angeles:
Heavy, averaging 275@300 lbs..$15.50@16.50
Mixed, 225@275 lbs..... 16.00@17.00
Light, 175@220 lbs..... 16.50@16.00

Rough docked 20 pounds, piggy sows 40 pounds and stags 40 per cent.

SHEEP—There was a better tone to this market the past week. Choice muttons and fat lambs were in fair demand. Poor and medium stuff, however, was both dull and weak.

Per cwt. f. o. b. Los Angeles—
Prime wethers.....$9.00@10.00
Prime ewes..... 8.50@ 9.50
Yearlings..... 9.50@10.50
Lambs.....15.00@16.00

North Portland, Sept. 23, 1918.

CATTLE—The cattle supply today is 110 head and 150 calves. The percentage of strictly good cattle remains small. Prime steers, $12.00@13.25; good to choice steers, $11.00@12.00; medium to good steers, $9.75@11.00; fair to medium steers, $8.25@9.25; common to fair steers, $6.00@8.25; choice cows and heifers, $8.00@9.25; medium to good cows and heifers, $6.00@7.25; fair to medium cows and heifers, $5.00@6.00; canners, $3.00@4.00; bulls, $5.00@8.00; calves, $9.00@12.00; stockers and feeders, $6.00@8.00.

HOGS—1750 head of hogs came forward over Sunday. While the run is heavy, the quality is all that could be desired, trading is brisk and prices are well maintained. Prime mixed, $19.50@19.75; medium mixed, $19.25@19.50; rough heavies, $18.50@18.75; pigs, $16.00@17.00; bulk, $19.50.

SHEEP—The arrival of sheep and lambs over Sunday was 1050 head. Trade is fairly good and prices are generally steady. Prime lambs, $13.50@15.00; fair to medium lambs, $11.00@12.00; yearlings, $10.00@11.00; wethers, $9.00@10.00; ewes, $6.50@9.00.

FOR SALE—Holt 30 tractor, Fire Bottom Benicia plow, 28-inch disks. Also 8-foot double disk harrow. Price $2,500. Fair Oaks Ranch, Willits, Cal.

TO REDUCE THE HIGH COST OF LIVING, send for our Wholesaler to Consumer Catalog. Smiths Cash Store, 106 Clay street, San Francisco.

PATENTS THAT PROTECT are procured through Pacific Coast Patent Agency. Savings and Loan Building, Stockton, California. Established fifty years.

ALL SIZES OF PIPE and screw casing, both new and second-hand, dipped and undipped. Guaranteed. Prices right. Shecter Pipe Works, 304 Howard St., San Francisco.

COUNTRY LANDS.

FOR LEASE—SUMMER SHEEP RANGE—Solid tract of approximately 50,000 acres logged-off lands, Butte and Tehama counties, California, for term of years beginning with season of 1919. Accessible and well watered. Estimated capacity based on previous use, 14,000 head. For particulars apply to the Diamond Match Company, Grazing Dept., Chico, California.

SANTA BARBARA HOME FOR SALE—Beautifully situated. Shade and fruit trees. Almost new house, 7 rooms, bath and toilet; 1½ acres on paved road near old Mission. Might exchange for part. No agents. Price $6500. P. O. Box 567, Santa Barbara.

WANTED—Reliable man to rent 30-acre ranch near Livingston, Cal. Must understand vines and give good reference. Take possession November 1st. For particulars address H. L. Shultz, Livingston.

WANTED TO RENT—A dairy farm with cows and equipment. Must be good proposition and up-to-date methods used, where man of experience can show ability. Dairyman, care Pacific Rural Press.

ORCHARD FOR RENT—Fifty acres apples; forty acres Bartlett pears; thirty acres bean land. Paradise irrigation district. Dr. C. A. Oliver, Chico, Cal.

SEEDS AND PLANTS.

WANTED—1918 sweet and bitter hard shelled almond seed, suitable for nursery planting. Seed must not be bleached. Submit quantity, sample, and price per pound. Fancher Creek Nurseries, Fresno, Cal.

WANTED.

WANTED—Position as superintendent or foreman on fruit or general farm by married man. Splendid executive ability, practical, experienced. References furnished and required. Address X. Y. Z., General Delivery, Atwater, Merced Co., Cal.

OWNER OF 360-ACRE MOUNTAIN RANCH desires responsible tenant. Cash or shares. Enclose stamp for particulars. Address, F. B. Plant, 178 Kempton Ave., Oakland.

POSITION WANTED to take charge of a hog ranch by a single man, experienced in handling registered stock. Hans Duveneck, Ukiah, Cal.

Announcement

To Present and Future Owners of Tractors:

Your tractor can now be equipt with a Bosch Magneto.

In every field of heavy service—on motor trucks, tractors, gas engines, business motor cars—wherever dependability is the first consideration—wherever the ignition must withstand continuous, severe strains and must not fail—there you will find Bosch Magnetos.

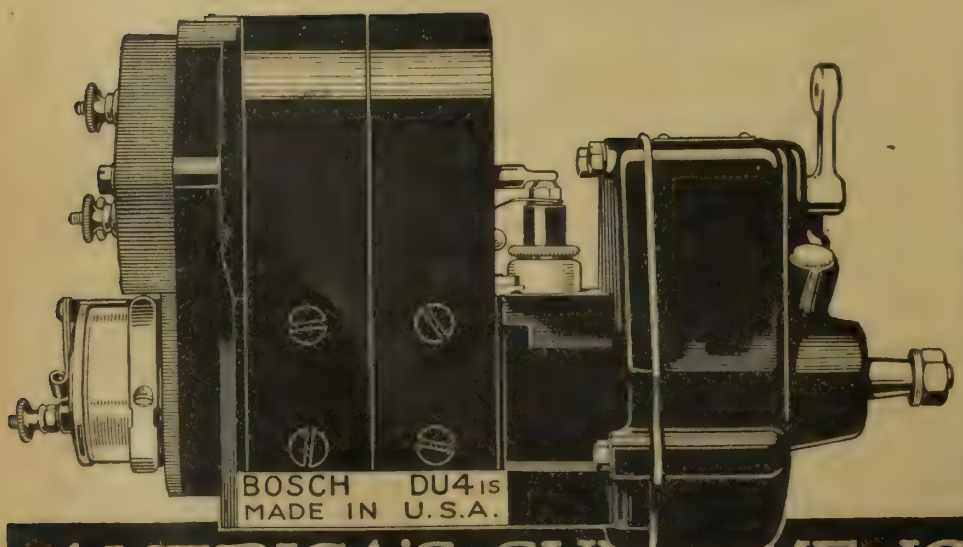
The dominant purpose of the Bosch Magneto Company today is war service. It is right that you, standing in the front line of Food Production, should be aided by the absolute reliability of

BOSCH IGNITION

The great Bosch Works at Springfield, Mass., have been enlarged not only to meet the direct war demands of our Army and Navy, but to serve a greater number of tractor owners than ever before.

Many makes of tractors have been Bosch-Equipt for years. The old line concerns know the superiority of Bosch. More and more makers will use this dependable ignition system, now that it can be had in quantities for early delivery.

But don't leave it entirely to the manufacturer. Other men may design, build and sell your tractor, but **you** are the one who will use it. You are the one who must make sure that you never will be held up by ignition trouble. You **will** make sure of absolute reliability when you specify on your order "**Bosch Magneto Ignition.**" Or, for your present tractor, have a Bosch Magneto fitted by a Bosch Service Man.



There's a Bosch Service Station in every State. Write there or to us for any Ignition Information.

BOSCH MAGNETO COMPANY

ALL'S FAIR IN WAR

Written for Pacific Rural Press
By R. H. Whitten

DOWN in Los Angeles a man died the other day. Residents of that healthful city won't admit that the grim reaper ever swishes his sickle in that direction, but this man certainly had been put to the by-by.

Elijah was sent down with his chariot to escort the deceased to the realms above, and their course took them over Exposition Park. Elijah mistook the place for Paradise, and was so captivated by its appearance that he decided to stop for a few minutes and give it the once over. So he started to wander one way and the deceased went another.

The latter soon met C. R. Thomas, the live-wire manager of the Livestock Department of the Liberty Fair, who took him in tow and, in his customary enthusiastic way, pointed out the interesting features as they walked slowly along the flower-lined paths.

When Elijah was ready to ascend upward he called to his companion, but the latter very emphatically refused to accompany him. "Nothing doing," he said. "Heaven has no attraction for me now. It can't beat this place, and I'm going to stay here."

This story is not far out of the realm of possibilities, for the attractions at Exposition Park are almost enough to make a dead one jump up and down with delight. The park is one mammoth flower garden, and with its artistic buildings, its pretty walks and drives, it constitutes an ideal place for such an event. It is almost in the heart of the city, and is reached by six different car lines.

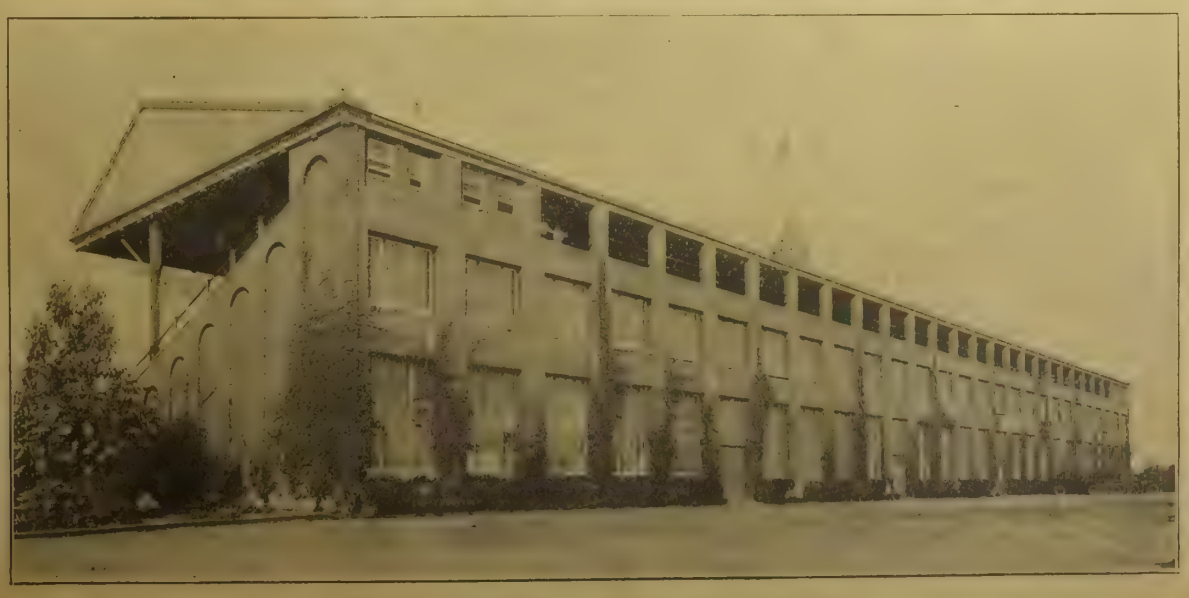
"Doubtless," an old lady remarked, as she bit into a luscious peach, "the good Lord could have made better fruit, but He never did." Doubtless, we say, He could have made a more attractive place to hold a fair, but He never did.

Everything about the grounds is just as complete and convenient as it is attractive. There are several substantial brick buildings for housing agricultural and horticultural exhibits; there is a one-mile race track with a concrete and steel fireproof grand stand; there are new barns and sheds for livestock, nicely arranged, electric lighted, and all fronting on a paved street that has been named Livestock Avenue.

Yes, more fairs than ever in war time. Uncle Sam encourages them to speed up the production of crops and livestock. He even supports them by sending wonderful exhibits direct from Washington. He wants you to attend, to get new inspiration and to learn improved methods for your work.

You can't afford to miss the great Liberty Fair to be held at Los Angeles, October 12 to 26, and especially the Livestock Show, October 20 to 26. It is a call of both duty and opportunity.

Main Exhibit Building, which will house the Food and School Exhibits at the Liberty Fair.



Rear view of the steel and concrete fireproof grand stand.

Wonderful Food Exhibit.

During the fair the present State Exposition Building will be known as the Food Products Building. Approximately 10,000 square feet of space will be given over to food exhibits. The local exhibits will show what California is doing to help win the war, and the Government exhibit will interest housewives along economic lines and give them many hints that will chop down the high cost of living.

Fruits and Flowers.

In the Horticultural and Floricultural Building will be housed the best of the fruits California has to offer; the finest of its flowers. The horticultural exhibit will include deciduous and citrus fruits, semi-tropical fruits, berries, nuts and all of the different dried and preserved fruits. Prizes aggregating nearly $5,000 in money have been appropriated for this department.

On Thursday, Friday and Saturday of the first week a dahlia show will be held for flowers grown in California. It is expected that at least 50,000 individual blooms will be exhibited, and that it will be the largest exclusive dahlia show ever held in the West.

During the second week there will be a general flower show for all classes and varieties raised exclusively in California. There will be exhibits from commercial and private growers—mostly from the latter—and blooms will be shown from some of the finest estates in California.

Implements and Tractors.

The Agricultural Implement and Farm Tractor Pavilion is 328x60 feet, and will house the greatest exhibit of farm implements that has ever been made on the Coast. On account of lack of space there will be no demonstration of field tractors, but many firms will install tractors on blocks and run them on their own power.

Uncle Sam's Part.

OUR ARC OF THE CIRCUIT.

WE ARE giving prominent attention in this issue to bombardment of the public mind preparatory to a major movement upon the west-front of the Animal Industry of the United States. The general strategy is to break in both flanks of the Sierra Nevada, drive irresistibly from the centre and before the winter closes in roll back all the champion middle-horns, short-horns and no-horns upon the Mississippi Valley—just as our boys and their allies are rolling back much less valuable cattle, the Hohenzollerns, upon the Rhine. Foch does not say much about his plans with the Huns, but we have no objection to stating ours in detail and to say to the public boldly—"You just watch us go through!"

This is the first year that the Pacific Coast has entered fully into the national aspects of the pure-bred animal industry. We have sported with more or less success upon the local edge of it and we have sent successful scouting parties to the very center, as national captures by California champions have shown, but our unbeatable champions have so multiplied both by introduction and home-breeding and our superiority of natural conditions for breeding and feeding has been so fully demonstrated, it is no longer possible for California to pose as the sunset of the animal industry when we are clearly entitled to function as the high-noon day of it. And so we marked out on the map of the United States a great Western circuit—as was claimed with much geographical and animalistic detail in the Pacific Rural Press of March 9, 1918. Thus early was our 1918 campaign for supremacy in the livestock industry set forth: thus early did we announce that on this new far-western front of livestock movement California was to mass shock troops on two sectors, Los Angeles and San Francisco, and champions from the more northerly stretches of our livestock domain were to rally at Portland—and thus from three points the Pacific Coast interests would flank and charge through the Sierra and sweep forward across the greater half of the country from its western rim to the very center of it at the Chicago International.

THE LIBERTY SHOW IN LOS ANGELES.

AND NOW the time is near for the opening of this campaign. Our right wing will be moving forward from Los Angeles with the opening of a general southern State Fair, October 12 to 26—the special feature of which will be the Liberty Livestock Show, October 19 to 26. Other writers on other pages will satisfy the reader that this event has been developed with great skill and attractiveness and that it will be an opportunity to secure wisdom for safe use of money and land in livestock production and to fill one's soul with enthusiasm and enjoyment—without which industrial activity is dead as the recent fighting of Hindenburg! And the splendid effort which has been put forth to secure for the Liberty Show all the material and inspiration which are needed to fill the appreciative heart with wisdom and impulses for action, reflects the spirit of the effort's environment in Southern California. Rains have fallen and the whole country has the aspect and sensation of California's best in autumnal spring time. New grass is starting and the sight and smell of it awaken the senses of man and his animals to new buoyancy and joy of life and action. It will be a splendid time to undertake a sojourn of a week or a month in Los Angeles and vicinity, before the throngs of Eastern winter fliers return to their accustomed hibernation. All the hotels and private lodgings will welcome the thousands who should attend. Their capacity is so ample and their rates so diverse that any purse can match its contents with acceptable rest and nourishment. Californians from all parts of the State should seize the present occasion for a general rally in the south. Mr. McAdoo is running his trains with unusual respect for schedules. The State highways are almost continuous in their perfection of surface for your own wheels and the runs, both through the interior valleys and by the coast line, are delightful and edifying. It will be really patriotic, also, for all who can command the trip to take it. It will give new nerve for productive effort and will be educative in the way thereof.

We are, however, pleading for a great success in popular appreciation and participation for the Liberty Fair not so much for personal nor even for sectional advantage as we are for the relation of the event to the general advancement of our livestock industries. If the right wing at Los Angeles springs to its place and attains its objective, the influence upon the whole forward movement will be strong. San Francisco's International on November 2 to 10 will be the next point on the new circuit, and we shall give a special issue to the preliminaries for that event, which need not now be particularized. Following San Francisco, Portland will advance the left wing, as we have already pictured. Thus the Pacific Coast will attain its present livestock objectives in three jumps—and the first thing to do is to throw a fine long spring from the starting scratch in Los Angeles.

PRO-GERMAN WEATHER.

SINCE our last issue there have been more September rains in parts where the preceding bunch of freak storms did not stage performances. This time Southern California and the southern San Joaquin had to take their shares of the unseasonable occurrences, with the result that beans and raisins had to receive the punishment instead of the prunes which the earlier rains lashed the hides from. Losses have been serious. It will be a long time before California will want more such heavy September rains and a long time, in the nature of things, before she will get others like them.

Our climatological friend, L. E. Blochman of Berkeley, while expressing due appreciation of our industry in compiling records in our issue of September 21 to show that September rains have no prophetic seasonal significance, suggests that we might go a step farther and give a reason why they are in this way insignificant. He shows us from his collection of daily maps issued by the U. S. Weather Bureau for a number of years that the storms which spoil the prunes and spill the beans for us do not belong to the storm system which gives us our dependable crop water, but are in fact a misdirection of the storms of the Sonora system, which throws down dog-day torrential precipitation in Mexico and adjacent parts of our southern border, in Arizona, etc. This is shown by the fact that our early fall rains usually move northward from the south and may be very heavy in spots in California while Oregon is unreached and dry, and the same may be true for our lower valley points, while our upper coast, which is normally our humid region, may get little or nothing. This fact is strikingly shown by this years' September storms, which gave Eureka 1.83 and Red Bluff 7.08 inches, San Francisco 2.53 and San Jose 6.33 inches, etc. These facts are a reversal of normal procedure at these points, for the normal seasonal rainfall at Eureka is 46 and at Red Bluff 25 inches; at San Francisco 22.27 and at San Jose 16.79 inches. The underlying fact is that the storms which make California crops are produced in good allied weather factories—that is, in our own Alaska territory or in the territory of our trusted ally, Great Britain, or in parts of the ocean adjacent thereto; and the water is conveyed to us by cyclonic movements which are southward bound from these northerly areas, while the storms which steal in upon us unseasonably from the south are made in Mexico and may therefore be suspected of pro-German motives and methods. Being between these two overlapping forces and being quite well equipped to measure the approaches of our own beneficent northern-made weather, it will certainly be wise to extend our weather spy system into the southern source of storms, which are as a rule malevolent and against which we should be better warned and enabled to protect our products.

COLOMBIAN FARMERS!

OUR FRIEND of the Bulletin, whose gallant efforts to protect his city parishioners against skinning by corner and curbstone food venders we recently commended, has fallen into sad thoughts. We infer from what we read in his columns that it is not so easy to evangelize these city pirates as he thought at first—in fact, we presume it is really a job which would cause Billy Sunday to think twice. With that matter, however, we have nothing to do except to imagine that possibly the unrepentent rascality which he disclosed among the retailers led him to look for softer hearts to break and so he arraigns the iniquity of the "farmers," as he calls them—being the producers who sell their own produce at the Colombo market place in this city. The Bulletin writer's complaint seems to be that all the profits which he could pry loose from the retailers were immediately added to the wholesale prices by the Colombo "farmers," where the consumers tried to escape retail extortion by buying for themselves at this apparently Italian commercial resort. We do not doubt what our contemporary cites as facts, but we would suggest that the Colombo "farmers" are really market gardeners and they are much better at a trade than real farmers are—though not better perhaps than all farmers ought to be and will be when they are more fully organized and sell their produce by their own agents. In fact, we are not offended at the statement that the growers may get more for themselves when they can compel retailers to profiteer less, for that is exactly what we think they ought to do. Therefore, we do not claim that what is said about the Colombo produce artists as "farmers" is foolish: in a way it may be prophetic.

FARMERS SELL NOTHING FOR NOTHING.

BUT OUR contemporary, having mistaken market gardeners for farmers, proceeds to describe other operations which he also attributes to farmers, and they are so foolish that we wonder if he has any sense left. He undertakes to describe the contract-buying of orchards and writes this:

> By this system the city contractor goes out when the trees are in bloom and buys the entire crop, he to take the fruit from the trees. His contract makes the unformed fruit his property. The farmer has no interest in it.
>
> Then the contractor, when the fruit is ready for market, looks the market over, decides whether he will ship, how much he can ship and not reduce the price, and either sells the balance on a subcontract to some canner or sells to the canner what he thinks will go well there.
>
> Understand, the producer only gets paid for what the contractor gathers, in nearly every case. If the producer price is high, the contractor is chary about gathering. If the market goes off in the city or at the cannery, he would rather lose the fruit than pay the farmer.

We are quite willing to admit that there are more kinds of chicanery among fruit contractors than we know about: in fact, we are not slow

California Weather Record

The following rainfall and temperature record is furnished the Pacific Rural Press by the United States Department of Agriculture Weather Bureau at San Francisco for the week ending at 5 p. m., October 1, 1918:

Stations—	Rainfall Data: Past Week	Seasonal To Date	Normal To Date	Temperature Data: Max'm	Min'm
Eureka	...	1.83	1.38	68	50
Red Bluff	.31	7.39	.86	90	54
Sacramento	.10	3.58	.42	82	56
San Francisco	.04	2.57	.50	72	56
San Jose	.01	6.34	.40	78	50
Fresno	.50	.58	.30	88	60
San Luis Obispo	.86	1.47	.51	80	52
Los Angeles	.44	.66	.07	96	60
San Diego	...	.19	.07	94	62

to believe almost anything that can be alleged against them; but this narrative conveys the idea that the grower is more kinds of a fool than the contractor can be a knave. In the first place, it is said that the fruit is all sold and the grower has no more interest in the disposition of it. In the second place, it is said that the grower allows the contractor to take as much of the fruit as he chooses at a certain price or to take none of it if he so desires. In other words, our friend claims that California farmers are such fools that they allow the contractor to buy the crop Indian fashion: "You take the buzzard and I'll take the turkey; or I'll take the turkey and you take the buzzard." We are quite ready to believe that there are contractors so slick that they never pay for anything and most farmers have a turn or two with them sooner or later, but if there are farmers who will sell a crop on the trees without getting some hard money in advance, or who will fail to bind a contractor to take and pay for all the fruit which is of a certain grade, we have still something to learn about fool farmers.

WILFUL WASTE OF FRUIT.

THE REASON why our contemporary undertakes the foregoing essay on the inequities of fruit selling is to provide an explanation of the fact that much fruit is wasted in current orchard policy which ought to be delivered to city consumers at a low price. In the first place fruit cannot be delivered in the city at a price which city people hold would be "better than nothing to the grower." If extortionate retailing cost could be reduced, there would naturally be more and more fruit coming in, because the grower would then presumably receive enough for it to meet his cost of picking, packing, hauling, freighting and selling, but exhorters on this subject seem to forget that there is an irreducible minimum of cost in all deliveries of fruit within reach of consumers and when the returns fall below this the grower cannot move it. He has already lost more than he can afford perhaps in the use of the land and the care of the trees. All this he cannot recover and if he undertakes to move the product toward a market which will not return the cost of handling he will be that much deeper in a hole. There may be some fruit wilfully lost through shiftlessness or laziness of the growers, but the amount is negligible. It is mostly on the country places of city people who have no commercial incentive to thrift. When fruit is wasted in commercial orchards it is not wilful: it is wasted because it will not return the cost of saving it, and of course with advancing wages for country labor there is an increasing quantity with potential value which is for this reason irretrievable. People talk glibly about laws to penalize waste of fruit on the ground that it is held back to create a scarcity and advance prices in a sort of a cornering operation. Our judgment is that there is not enough of that done to warrant enactment. Shipments are sometimes reduced to escape loss of cost of production and that has to be done in all kinds of production because producing for less than cost is destruction to grower and starvation later to consumer. We paid two cents for a Bulletin yesterday and we paid three cents today. We believe the advance is necessary under present costs of production and delivery. But the publication of the Bulletin is a monopoly and can fix its price on the basis of cost and we can only take it or leave it—so we take it. Unorganized fruit growers cannot do that. They ought to be organized and do it, but as things now are they can only send in fruit so long as it sells for more than cost and then stop or go broke. Can you change that by a law against waste? City people can get all the fruit they wish except when war or weather strikes it and all they have to do is to make it reasonably profitable to ship it to the city. Under normal conditions it is ridiculous to talk about cornering the supply for San Francisco in a State with California's production. It is the business of San Francisco to determine whether it is enslaved by commercial cutthroats from the water front to the ocean beaches. We do not know, but we do know that San Francisco can get all the fruit it desires if it will arrange to pay the growers reasonably for it.

QUERIES AND REPLIES

By the Editor.

Inquirer Must Give Full Name and Address.

Bad Peaches with Good Foliage.

To the Editor: I have several varieties of peaches and all have been more or less shriveled, disfigured and covored with tiny spots of gum. Last winter I sprayed with lime-sulphur and the foliage of the trees is in fine condition, although there are many small dead twigs. This latter is also the case with the apricots, but fruit was clean.—Grower, Concord.

You may have killed the twigs by using the lime-sulphur too strong, but the good foliage you mention indicates that the trees are in good health. In this years' pruning cut below the injury so the wounds will be in healthy wood. As to the ruin of the fruit, that seems to have been done by insects which chiseled into the surface in irregular ways, making many-formed wounds from which the epidermis was removed and the sap exuded. We do not know what insect did this. It apparently worked when the fruit was about half grown. It looks as though this injury had no relation to the death of the twigs. Keep watch next summer and see if you can catch the depredator.

Wheat on Summer Fallow.

To the Editor: I have 200 acres of summer fallow which I will plant to wheat. Would you advise me to plow it again or to double disk it? Which will give the best results? Also have 200 acres of bottom land. Would you advise me to dry plow or wait until the rains come and winter-sow it?—R. B., Orosi.

On your first field it depends upon what shape the land is now in. If it is a free soil and summer fallowing has been done, we should rely on disking. If there is a plow-pan and the soil is heavy, we should plow the pan up and then disk well. Wheat likes a firm seedbed but not a plow-pan, which will cause it to drown out or dry out—according to the rainfall. If your bottom land is reasonably clean, we should plow and sow dry. If it is foul, we should plow dry (if the rains do not wet it early), disk out a crop or two of young weeds and sow in December. These hints are framed up, of course, for your situation in a dry part of the interior valley.

Crude Oil on Johnson.

To the Editor: Is it practicable to use crude oil on ditch and canal banks to keep the Johnson grass under control?—F. R. D., Biggs.

Such trials of it as we know of have only resulted in a temporary discouragement of the plant.

WORK THAT PAYS

The war has depleted our field staff to such an extent that we need a few red-blooded men to attend to our renewals and secure new subscribers.

It is real, necessary, war-time work, for we are helping Uncle Sam to increase food production by showing our readers how to raise more and better crops.

We can use elderly men, and lack of experience is no barrier. No investment necessary, except that you must have an automobile. Straight salary; permanent work, with advancement.

Write for our proposition and tell us a little about yourself. You will be glad you investigated.

I Am Public Opinion

All men fear me!

I declare that Uncle Sam shall not go to his knees to beg you to buy his bonds. That is no position for a fighting man. But if you have the money to buy and do not buy, I will make this No Man's Land for you!

I will judge you not by an allegiance expressed in mere words.

I will judge you not by your mad cheers as our boys march away to whatever fate may have in store for them.

I will judge you not by the warmth of the tears you shed over the lists of the dead and the injured that come to us from time to time.

I will judge you not by your uncovered head and solemn mien as our maimed in battle return to our shores for loving care.

But, as wise as I am just, I will judge you by the material aid you give to the fighting men who are facing death that you may live and move and have your being in a world made safe.

I warn you—don't talk patriotism over here unless your money is talking victory Over There.

I am public opinion!

As I judge, all men stand or fall!

Timely Topics on Pruning Prune Trees

[Written for Pacific Rural Press by John J. Fox.]

After the boxes and trays have been scrubbed with lye and put away, the grader cleaned and put under cover and the cover-crop harrowed or cultivated in, prune growers will get right to work on the trees. It has required much fortitude to face the recent "visitation," but every place I have been, after the first dazed condition had passed, the grower went to work to save whatever could be saved. And now to prepare for next season. The late rain has saved thousands and thousands of trees and invigorated them all. And they needed it. The Rural Press said some months ago that if we did not get early rains there would be heavy losses of trees from malnutrition. The rains came and saved that situation.

It is none too early to begin pruning. For the sooner this work is done and the trash cleared out of the orchard the more free the orchardist is to get in and spray whenever he wants to. Also the less will the cover-crop be injured and the ground will not be tramped unnecessarily during the wet weather.

FRENCH PRUNES.

If the suckers have not been kept out of the tree, they are the first thing to be removed. No strong growing sucker should be permitted to remain unless it is seen that it is needed to replace a decaying or moribund limb, or to fill up space where one has broken off. For a strong sucker will begin to starve the best of limbs by the time it is three years old. In saving a sucker for future use, it should be pinched before it is mature, otherwise it grows in length out of proportion to its strength and very often has no laterals to speak of on its lower length.

WHAT WE ARE STRIVING FOR AND HOW TO GET IT.

We are pruning our trees to increase the quality of the fruit-bearing wood and of the fruit. As the prune bears its fruit on two-year buds, it is necessary to cut so that we may induce a healthy growth of new fruit wood each year and yet not so hard as to create a heavy wood growth at the expense of a year's crop. This, then, is a matter of individual judgment, which has to be exercised according to the growth and character of the tree. Small, very spindling growth will produce small prunes. One of the commonest errors is to leave too much fine brush. To go fumbling around in these dense masses with a hand shears to thin out would take too long in a commercial orchard. Therefore, the thinning of twigs must be done in clusters, cut right back to a leader or strong lateral and let in a little daylight. Later, when new wood is produced, the very small twigs will die out and slough off. Long, useless, small limbs with a little bunch of twigs at the tip can generally come off. There is usually one of these under an end crotch. The chief thing to be aimed at is to keep the tree fairly open but not exposed; to "thin out" every year; to induce some new, healthy fruit wood each year, and eliminate dying wood.

If your tree has overborne, or produced a large crop of stick-tights that made neither size nor sugar and had to be batted off the tree, cut harder than usual and if half a limb has to be sacrificed it must be cut carefully and cleanly back to a leader or fork in such a way that it can heal over. This is very important. A slovenly pruner will often leave a little stub sticking out instead of pruning off close so that the bark may cover it. These are called "Jap knots" because it is difficult to get Japs to do the careful work needed. If a large cut is made, it should be covered with asphaltum. For here is where the soft rot enters that makes the wood spongy on the inside of the tree or limb. It is lots of trouble, but that is part of the business.

RENEWING OLD LIMBS.

Any limbs that show decay or half-dead fruit wood at the ends should be cut back to vigorous wood at a strong fork. If there is none, then it is time to see about renewing that limb and a sucker can be saved for future use. When a sucker is three years old it should be large enough to take the place of the limb it has been robbing unless it is seen that that limb is still doing good, profitable work. But if the limb is cut back to the sucker at the second year, there is more danger of losing the sucker, too. In any case great care must be taken of these large cuts. Henry Wheatley of Napa is experimenting on a small number of trees in his orchard to see if he can rehead them at a height of about 14 feet.

IMPERIAL OR CLAIRAC MAMMOTH.

These trees do not need so much pruning as the French after they have arrived at maturity and the fruit appears more on the bud spurs than as terminal clusters. They only need to be thinned out and sometimes shortened back on the limb when its carrying strength is endangered. It is impossible to prop everything. The Robe de Sargent carries its fruit also largely on bud spurs. It is an upright grower and thrusts out its limbs like a bunch of spears instead of having feathery, drooping twigs. Occasional shortening back is advisable. Both these varieties have strong wood like the French.

The Sugar prune, on the other hand, has brittle wood, like a Jefferson plum. Because of this and the fact that it is a heavy bearer, it must be pruned practically on the lines of a peach or apricot and pruned back every year.

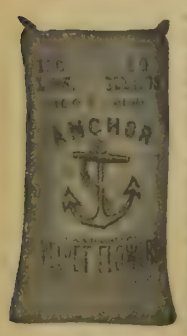
TREATMENT OF YOUNG TREES.

Damsons are treated like a French prune and the various plum trees a modification of Sugars or Robes, according to their varying character.

Once more let us return to the much-discussed question of the young tree. It should be headed at not to exceed 18 inches. It may sometimes be let go after one more cutting, though I favor cutting two years of growth. The main leaders at head-high may be 4 or 6 in number. After the second cutting, French prunes should be allowed to go and be topped no more. Then fruit wood will form. They will come into bearing earlier, produce as fine a tree and, in my opinion, are not so likely to gum and die off in areas as if cut back hard again till four years old.

It is claimed by some that after a tree is once planted out it will make a large tree quicker if it is never pruned back at all. Perhaps it will, but that center will have to come out some time and when it does the limbs are left in too horizontal a shape to sustain a large load and the center of the tree is exposed. Let us stick to building our trees. Back to nature can be carried too far. Adam and Eve found that out.

SULPHUR



It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards 6 times they will not be affected by MILDEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of Sulphur, also EAGLE Brand, Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphurs that money can buy; the best for vineyards; the best for bleaching purposes, LEAVING NO ASH.

Try our new brand of VENTILATED Sublimed Sulphur, 100 per cent pure, for making Paste—(Atomic Sulphur) and for Dusting.

For Lime Sulphur Solution, use our DIAMOND S Brand Refined Flour Sulphur. We can furnish you this sulphur at such low price that it will pay you to mix your own solution.

FRUIT TREES

Grown on Virgin Soil

Does it make a difference whether the nursery stock you plant has been grown on old, wornout soil, or whether it has been produced on fresh, "live" soil? Ask the grower who has planted trees from this nursery—trees grown on fresh, virgin, unused soil. He'll tell you that it makes a heap of difference!

Elmer Bros. Fruit Trees

are absolutely the best you can buy. Strong, healthy, vigorous trees that GROW—and PRODUCE—and return a handsome PROFIT year after year—and year after year. We are large commercial growers as well as nurserymen—and we invite you to put your fruit-growing problems up to us. We'll help you to make money from fruit.

ELMER BROS. NURSERY

"The Nursery That Helped to Make Santa Clara Valley Famous."

76 So. Market St. - - - SAN JOSE, CALIF.

Beet Sugar Lime Fertilizer

The most readily available form of lime, having been hydrated, contains a little nitrogen, potash and phosphoric acid. Is thus a mild, complete fertilizer. Cost six to seven dollars per ton in bulk in car lots, f. o. b. cars the siding nearest your ranch, south of Chico and north of Tehachapi.

CHICKEN MANURE

The richest of all manure, is the most economical, handling and freight cost being the same for others as for the highly concentrated chicken manure. Car lot bulk shipments only.

Made in the west for western conditions

GIANT FARM POWDERS

STUMPING — AGRICULTURAL

Western soils, stumps and climate need western explosives. That's why Giant Farm Powders cut the cost of clearing western land. Manufactured for more than half a century especially for the West, they naturally give better results on western farms and orchards.

Giant Farm Powders lead in economy because they go further than ordinary explosives. They break up the stumps thoroughly thereby cutting down labor cost. Money and trouble are saved because of their low freezing qualities.

Warning: If your work is done with any other powder or dynamites, the chances are it will not be done as well as with either of the two Giant brands: Eureka Stumping or Giant Stumping. Look for the Giant trademark on every case, and be sure of the genuine,

How to make the farm pay more money is explained in "Better Farming." This big free book, fully illustrated, will be sent you as soon as we receive this coupon.

California Associated Olive Growers

[Written for Pacific Rural Press.]

This association has been called upon to modify entirely its selling plan to meet the changed conditions of the market affected by the war, these conditions including a falling off in the demand for canned ripe olives for purely economic reasons and an increased demand for the Italian type of olive, owing to the impossibility of obtaining transport from Europe for their exportations. The association has therefore deemed it advisable for the best interests of its growers to sell its entire crop on a guaranteed basis for the period of two years, without hazard of any kind and for cash on delivery. This is better than trusting to an uncertain canned olive market, which bids fair to remain thus until the war is over.

The association is just as much in business as ever and more time will now be given to building up and strengthening the institution. Its expenses have been cut to a minimum and its members are safeguarded for the next two years, with returns to its growers greater, under existing conditions, than could be made if the fruit were processed and canned. At present the association deals only in ripe olives and operates its plants for a period of only five months per year. During the next two years the association purposes to devote itself to acquiring an intimate knowledge of growing and packing food products other than olives, in order that it may keep its plants in active operation throughout the year when the two years' lease has expired. The lessees, the Pacific Products Corporation of Boston, Mass., has given a substantial bond for the faithful performance of its contract. It will confine itself to preparing the Italian type of olive, which is not competitive with the canned ripe olive of the association in any way. The above constitutes the substance of the manager's (J. C. Martin, Jr.) statement to the members of the association.

ORCHARD IRRIGATION IN NAPA COUNTY.

[Written for Pacific Rural Press.]

Henry Wheatley, president of the Napa County Farm Bureau, has irrigated part of his prune orchard for two consecutive years. A large portion was irrigated for the first time this last summer. A portion was left which acted as a check to determine results. He estimated that the trees irrigated will this year yield about $100 worth more of prunes to the acre than those not irrigated. It costs him about $5 per acre to supply the water, which is pumped—electric power being used. Two furrows are plowed between each row of trees—the furrows being about six feet apart. This is accomplished with a heavy double-breasted plow drawn by a Yuba tractor. The water is allowed to run down these rows for from three to five hours or more, as the flow is only about 50 gallons a minute. The ground is, of course, cultivated as soon as it is in a fit state to work, after the water has been turned off.

The irrigation was applied through June and the early part of July and the benefit is not alone in the crop but in the increased vigor and condition of the trees themselves. Those trees that were irrigated earliest made the best showing as regards color, foliage and fruit. The last part irrigated showed a small percentage of cracked fruit. Mr. Wheatley said at the time we were there in July: "Whether the fruit cracks or not, I shall continue to water for the sake of bringing my trees through in good shape." And he wins!

HIGH PRICES FOR GRAPES.

The spoiling of many grapes has led to a high price being paid on those shipped East, Tokays from Lodi, Florin and Elk Grove bringing from $3.15 to $3.35 per crate; Vacaville Tokays from $1.85 to $2.65, the average price for these grapes being $2.84 per crate; Malagas averaged from $1.75 to $2.75; Cornichons $3.35 per crate and Fancy Muscats $3.40 per crate. Of wine grapes shipped, Alicante Bouchet brought $2.40 and Zinfandel $1.50 to $1.85 per lug box. These prices establish a new record.

Almond growers should keep their varieties separate or they will lose in price. Deliver each variety promptly as soon as it is harvested and bagged.

LARGEST STOCK IN AMERICA
Decomposed.

Sheep-MANURES-Steer

Concentrated
In Perfect Mechanical Condition

Because of the shortage of manures in this territory it will be well to consider NOW your fertilizer requirements for the next twelve months. More carefully handled and prepared than other manures. From highest nitrogenous feed.

Steer Analysis		Sheep Analysis

"You Can Just See Them Grow"

"Look at 'em!—Planted two years ago, and just see how they've taken hold! When I put them in I wouldn't have believed that blasting the holes instead of digging them would have made them grow like that. But there's the *proof* and it's the kind of proof that looks good to me. Another couple o' years and they'll be bearing. Then I can 'cash in' on my forethought in planting with *dynamite*."

"Am I glad?"

"You *bet* I'm glad that they told me about

HERCULES DYNAMITE

"Try it yourself the next time you plant. I'm not the only man who will tell you it's a good thing. Ask any man who has used dynamite."

"That isn't the whole story either; you can keep your bearing orchards in good shape by blasting between the rows every year or so. The shock of the explosion stirs up the packed soil around the roots and gives them *breathing* space. Your trees will show you quickly enough whether they like it or not; you'll see the difference in a year. They will grow better, and look better. And lusty trees bear the kind of fruit that brings the top notch price on the market."

"Why don't you send to the Hercules Powder Co. for their book, 'Progressive Cultivation'? It tells you all about the use of dynamite on the farm. You can profit by it as I did. If my copy of this book was the last one in the world I wouldn't part with it for a thousand dollars!"

Farm Products Must Increase

If we are to win the war and win it quickly our soldiers and our allies must be well fed. We cannot expect them to do their best to win unless we do our best to back them up. How are you going to make every acre of your farm produce to its utmost? Just as our army must be well fed so your soil must be fed. You must supply it with the elements necessary to produce crops.

GOLD BEAR FERTILIZERS

are scientifically manufactured to meet California soil conditions and crop necessities. They are made from animal products that contain the necessary elements to feed your crops.

PRUNE CONDITIONS TO DATE.

After again visiting the principal prune growing sections and getting official reports from the smaller ones, we venture the estimate of this year's prune crop at 45 per cent of what was expected from August estimates. In the Santa Clara Valley we figure 15 per cent of first-class fruit, 15 per cent of No. 2, and any salvage beyond this an unknown quantity. For as nobody knows what some of these damaged prunes will bring, large quantities were dumped and no further chances taken. Most growers have made every effort to save all fruit that was fit to offer for human consumption, in spite of the many difficulties encountered of obtaining adequate man-labor, of dull weather, damp drying grounds and clean tray shortage. In this last trip through the orchards one is immediately struck by the improved condition of the trees everywhere. Foliage in many sections looks better than it did early in August. The buds are plump and well filled—as good as they have ever looked at this time of year and better than most years. Where every man was secretly worrying about his trees at the beginning of harvest, that anxiety has been removed. Wherever the rains went they have left behind them good conditions in orchards, many of which now have a fine carpet of green, which will be turned under later as a cover-crop.

EMERGENCY LABOR IN THE SOUTH.

In many of the Southern States women are organized and being used to a large extent in harvesting the crops, both in the orchard and field. Both white and colored women are doing their stint and it is found that they are capable and industrious. Men teachers and high school boys have been spending their vacations on the farms. In Tennessee chores are turned over to women and children. One hundred women are reported plowing in one county. Tractors work day and night. In Oklahoma farmers have co-operated in the purchase of tractors and using larger implements. In West Virginia, Banks, factories and stores have released employees for short-time farm work. Farmers are working longer hours and Sundays. In Georgia white women have organized to pick cotton and packed a large part of the peach crop. Anti-loafing laws or ordinances for drunks and slackers have been enacted, for, to use a good old quotation, "Neuters, in the middle way of steering, are neither fish nor flesh nor good red herring."

NEW MARMALADE COMPANY.

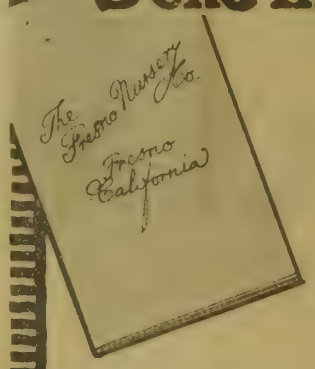
At a meeting on September 4 of the Citrus Growers representatives of 49 associations signified their intention of joining the new marmalade company evolved from the Crawford corporation, making it a purely mutual exchange proposition, to be owned exclusively by exchange members. It is their present intention to take charge of the sale of all cull oranges and grapefruit of their members, making as large a proportion of the fruit as possible into marmalade and disposing of the rest by converting it into candied peel, orange juice, etc. The market for good fruit will thus be improved and a good return made to members on culls. The intention is to advertise the marmalade widely under the "Sunkist" brand.

The amount of marmalade produced from this season's crop is expected to be one and a quarter millions of pounds. Next season 7,000,000 pounds will, it is hoped, be manufactured. Two factories are now in operation. About $60,000 has been provided as an advertising fund and the first advertisements will appear in national magazines early in the year. Good luck to the undertaking.

CURRANT MAGGOT.

The larvae of this fly are in the ground and the best way to control is to dig over and stir the ground thoroughly under and around the bushes now and then late in March. This may be effective enough to save your gooseberries and currants from containing maggots next spring. There seems to be no other way yet of dealing with this creature.

Send in Your Name



Every Horticulturist in the State will want our new Fruit Tree Catalog when published. Your name and address on a postal card sent now will assure you of a copy.

FRESNO Climatic conditions cannot be excelled for the production of well matured trees. "FROM THE ROOTS UP" is our motto. Commercial orchardists all over the state purchase our pedigreed trees because they give best results.

Place your orders now and have us reserve your stock. Do not forget to send your name and address and make sure of receiving an early copy of this year's catalogue and price list.

Here and There in the Fruit Business

[Written for Pacific Rural Press.]

Universal Sugar Price.

The Sugar Equalization Board established by the Government will fix a universal price on sugar for the whole country, based on the average cost plus a small margin of profit to cover expenses of handling. In practice, the work of the board will amount to this: (1) All the available sugar supply will be districted, and as much beet sugar will be distributed in the West and Middle West as those sections can consume; Hawaiian cane sugar will be shifted to the Pacific Coast and Canada; Louisiana sugar will be sent throughout the Southern States; Cuban and Porto Rican sugar will be retained in the Atlantic Coast and Central States. (2) The profits made by the board in selling cane sugar at 9c which was bought at 5c or 6c will be used to equalize the loss suffered in buying Western beet sugar for 8c or 8½c and selling it at the same price. (3) Under the board, each section of the country is assured of its supply of sugar, so profiteers cannot operate. With beets at $10 a ton and the price of sugar assured, both grower and refiner may go ahead with confidence in the future of the industry. It will also give a feeling of relief and assurance to the consumer.

An Urgent Appeal.

An urgent appeal is again sent out by the United States Food Administration to save all fruit pits of every description, and all walnut and almond shells, and the shells from pitted apricots. These shells, as before stated, are needed, and badly needed, for the manufacture of carbon used in gas masks to protect our boys at the front. Hundreds of tons more can be saved if every home, restaurant or small producer sets aside every pit or shell—even those that come off the table after you have eaten your prunes, plum jam or canned peaches. Two hundred peach pits or their equivalent in other shells will produce enough carbon for one mask. No quantity is too small to be of use. Your local Red Cross will tell you where small amounts may be mailed. Boy Scouts, mothers of scouts, soldiers and sailors will bear this in mind. And the saving must go on as long as the war lasts.

Federal Land Bank of Berkeley.

During the month of August this bank approved 166 applications for loans totaling $511,700; 143 loans were closed in the amount of $426,400. This brings the number of loans already made by this bank to 2528, with a total in the hands of the borrowers to date of $7,609,100. Seven hundred and thirty-three more loans have been approved but not yet closed, and the amount is now probably past $8,000,000. The total number of loans closed by all the Federal Land Banks since their establishment is 55,325, with a total amount loaned of $124,877,354.

Fighting Pear Blight.

Burle J. Jones, Farm Adviser of El Dorado county, who was in charge of the campaign against pear blight in his fruit growing section this year, says the blight has been dormant this summer but is again showing up in the form of hold-over blight. He is urging the farmers to cut out infected wood at once and burn it.

The Raisin Crop—a Bonanza.

This season's raisin crop is estimated to reach 175,000 tons—almost twice the tonnage of the 1912 crop, and the price of the fruit has more than doubled. It is only to be expected, in view of the heavy plantings of Thompson seedless, that they shall gradually come down to meet the price of Muscats.

Pear Prices in New York.

California Bartletts last week brought from $4.50 to $5.90 a box. A large quantity of California pears have arrived on Eastern markets over-ripe, owing, it is supposed, to the fruit cars not being properly refrigerated. These sold down to $1 a box.

Why Choose the Salway Pit?

The reason for choosing the Salway pit for planting for tree stock is (1) that it is hardy and makes more growth; (2) continues to grow later in the fall and is not inclined to sucker.

Separate Varieties.

Almond growers should keep their varieties separate or they will lose in price. Deliver each variety promptly as soon as it is harvested and bagged.

Why Grapes May Dry Up

To the Editor: I am considerably annoyed at the loss of a great many bunches of grapes in my vineyard which about the time of maturity wither up and become entirely useless. I have discussed the matter with some of my neighbors and a considerable difference of opinion exists. Some of them say it is due to excessive heat; others say it is due to stinging of insects; others say it is due to alkali in the soil, and others think the damage is done by small birds. Will you kindly state your opinion as to the cause of this injury?—Subscriber.

[Answer by Prof. F. T. Bioletti, University of California.]

I am unable to tell from your subscriber's letter what may be the cause of the drying up of his grapes. Grapes dry up about the time of maturity from a great variety of causes. If most of the grapes on a vine dry up, it is usually due to lack of water in the soil. In this case, the drying up is usually not complete; that is to say, the grapes simply shrivel and fail to produce the proper amount of sugar, acid, and juice. Usually much the same symptoms are produced by anything which destroys the leaves of the vine, such as vine hoppers. The attacks of root insects are often responsible for the more complete drying up of the grapes, but usually only on a part of one side of a vine. The grape root worm or adoxus vitis often has this effect, especially on Tokay vines. Alkali may have a similar effect, although where this is the cause it is usually very plain from the appearance of the vineyard. Whatever the cause, excessive heat, especially when it comes suddenly, will intensify the damage.

How the packer is saving millions out of waste

—and how this results in higher cattle prices for the stockman

The development of by-products out of waste means a saving of about one hundred and fifty million dollars annually—a sum sufficient to keep New York's six million people supplied with meat for six months.

THERE was a time when the steer was handled solely for its edible meat, its hide, and its tallow.

The remainder of the animal, in weight totaling many millions of pounds annually, was thrown away—a sheer waste.

Today virtually all of this former waste is utilized. Over 250 articles are now contributed by the steer to human needs, and a larger proportion of the animal is saved for human food.

At the time of writing $135 is, on the average, the price paid for the average beef animal to the stockman by Swift & Company.

But if the old order of waste still prevailed and only the hide and tallow were saved, Swift & Company would be obliged either to pay not more than $125 to the stockman, or to charge the public higher meat prices.

Thus, you see, by-product utilization results in a saving of about $10 per animal—a saving which, when multiplied by the total number of cattle dressed annually by Swift & Company, over two million, amounts to more than twenty million dollars annually. This saving goes to the stockman in higher cattle prices and to the consumer in lower meat prices.

If applied to the entire number of cattle dressed annually in America, approximately fifteen million, this saving would amount to about one hundred and fifty million dollars annually.

The real development of by-products came with the development of the larger packing organizations.

Success was attained not easily, but by patient effort, by exhaustive experiment, by intense specialization. It has been a big job and has called for big methods—a job far beyond the resources of the old, unorganized system of local meat dressing.

Not only are the by-products saved but their value has been increased through better handling of hides, fats, and other edible portions of the steer.

Swift & Company is glad to have had a part in this development. It is an achievement of thrift—an achievement that has made possible today lower meat prices to the consumer and higher prices to the producer of cattle than would have been possible under the old methods.

Swift & Company, U. S. A.

A nation-wide organization owned by more than 22,000 stockholders

Bean Prospects on the Pacific Coast

[Written for Pacific Rural Press.]

Prospects for small white beans appear better and the rain damage less the farther south one goes from Salinas to Lompoc Valley along the coast. This is the chief small white producing area of California; and the bluepod strain comprises by far the greatest proportion of these. Harvest was in precisely the same stage throughout the entire distance. In all districts some beans were still uncut, but most of them were in piles. Very few had been threshed. The beans which had shattered in harvesting were sprouted as much as a half inch long on the third day of the rain. Where pods in the piles had opened, the beans within them also had sprouted. The Salinas district has about 20,000 acres of beans, half of which, according to Farm Adviser T. C. Mayhew, are small whites. On the higher levels the average normal yield is about five sacks per acre, as told by Chris Fanoe, one of the few who had threshed, while in the lower lands ten sacks is normal. The yield per acre this season is about normal; but the loss by about six inches of rain is probably 50 per cent. It will be greater if sunshine dries the pods quickly. Cloudy weather, with wind and plenty of turning, might save a greater proportion. Vines still standing allow many pods to rest one end on the ground.. These will have rotted and the lower beans sprouted. On heavy land it is hard to cut them by machine, as they mix too much with the mud. If weather remains wet the beans mold. Discoloration is the least of the damage. Pods which do not open or decay protect their beans from wetness and shattering. The large plantings of the Salinas Land Co. near King City are later than fartner down the valley. Of their 1600 acres of small whites, blackeyes, and bush limas, only about 200 acres had been cut before the rain. Beans in the Paso Robles district are mostly grown among young orchard trees. Martin & Cousins report that Red Mexicans did poorly this season on account of thrips, for which spraying with blackleaf 40 seemed ineffective. Pintos proved very successful. G. A. Nehrhood, who is one of the largest orchardists there, reports a half crop of beans, with pinks doing better than Mexicans, this being the first visitation of thrips. His teparies yielded six or seven sacks per acre, all varieties being without irrigation. Around San Luis Obispo westward to the sea and southward, the beans are principally bluepods and yielding fine crops, up to 15 sacks per acre or more, with poor crops scarce. A. B. Spooner on the coast has various areas going over 15 sacks per acre, others going far below that. Mr. Spooner and his tenants expect about 5000 sacks of bluepods from about 500 acres. Spring rains coming in a bunch prevented getting some land, especially adobe, into fit shape to hold the moisture and mature a good crop. The September rain in Los Osos Valley and surrounding territory was 1.63 inches, enough to require turning of the beans and put them in danger of popping when the sun shines. More beans per acre and more acreage are to be found in this valley than last year. Arroyo Grande Valley received only about two-tenths of an inch of rain and the beans were not injured. Cutting proceeded right after the rain. E. C. Loomis had contracts with growers to furnish 22,000 sacks, but many of the growers are coming back for more, having underestimated their crops. The bottom lands are all beets and beans, mostly bluepods. Hills where the beans have to be sledded to the bottom are producing four or five sacks per acre where they had previously been used only for range. Lompoc Valley, in Santa Barbara county, according to A. C. Whittemore and H. M. Hawkins, produced last year 266,655 sacks of bluepods, 14,401 of pinks, and 4586 of large whites. Mr. Whittemore and A. Lehman figure the average yield normally about 12 sacks per acre and expect the total yield this year to equal or excel that of last year. Mr. Hawkins thinks the yield per acre averaged about 18 sacks last year and will be about 14 sacks this year with increased acreage, making the total crops about equal. He believes there are about 300,000 bags of bluepods this year and not half as many pinks as in 1917. Santa Maria Valley, according to Mr. Scaroni of the Bank of Santa Maria, has about 60,000 acres of "small white" beans and a few pinks. His estimate of yield is more modest, being about 7½ sacks per acre. It must be said that estimates of average yield per acre are very unsatisfactory because one estimate may include fields which fail while another may include only fields which pay well to harvest. Santa Maria has beans which will yield 25 sacks per acre. Lompoc claims more for her valley floor.

BERMUDA ONION SEED.

Just as the Coachella Valley has made a name and created a demand for her Bermuda onion seed, she has lessened her production. This is owing to having experienced two successive years of poor yields. Most of the seed has been imported from Teneriffe (Canary Islands), but war conditions have made the imported article difficult to obtain. And, besides, many of the Texas growers prefer the California seed. S. S. Lawrence of the Seed Report Service, U. S. Department of Agriculture, has just given us this information, as it is most desirable that the growing of this seed for the market be extended to meet the increasing demand. Bermuda onions for seed were first planted in Coachella Valley in 1904. Satisfactory crops were obtained for the following eleven years, which led the growers to look for an average yield of 1000 pounds to the acre. In 1917 the yield dropped to 175 pounds. Thrips and "burn" are reported to be the cause of most of the damage last year and this. The acreage for 1918 is said to be 140 and the estimated yield to be 20,000 pounds. A shortage of bulbs for seed is also reported. Mr. Lawrence says that there is a large foreign demand for our vegetable seeds, which are chiefly grown in the Santa Clara Valley and the delta region of the Sacramento. Onions, carrots, beets, spinach, salsify are all less than demand. On sugar beets we will have to import one-fourth of our seed this year, but shall grow enough next year.

Insure Big Results!

Plant Germain's Hairy Peruvian Alfalfa Seed!

Wideawake ranchers are buying *Germain's* reliable, *proven* seed now.

Hundreds of orders remained unfilled last year, due to the tremendous demand. Our supply is limited—very little seed has been produced—and the demand this season will be greater than ever.

Hay prices are soaring. It is up to every rancher to make his field produce to the utmost.

We successfully introduced this wonderful type of seed in this section. And we stand solidly back of it. We guarantee it to be the true Hairy Peruvian strain. To insure perfect results we advise you to buy only the special Germain variety.

Place your orders now and avoid disappointment. Special folder containing testimonials, upon request. When you write, please mention this magazine.

CAUTION—For your protection Germain's Hairy Peruvian Alfalfa Seed is sold ONLY in sealed and stenciled bags.

Field and Garden Notes

Modesto Field Crops.

Grain in the Modesto Irrigation District was practically all under cover when the rain came, according to Henry G. Turner of The Grange Co. Wheat was all in warehouses and mostly sold to mills or Government. Perhaps 5 per cent of the barley was in the field and damage may have reached $2 per ton on this. There will be at least three times as much wheat acreage next year, most of it to be on land that would otherwise be in barley. Seed wheat sales have exceeded any recent years. The 1500 sacks of Early Baart seed offered by The Grange Co. were long ago sold. Most of the wheat in this district is Bluestem and Club, with a little Sonora on land suitable for only this variety. There will be a fair acreage of oats, but barley is hard to move and the acreage will be much less next year.

Hay Damage Severe.

Very little hay was in the warehouses. People were awaiting better prices. Of baled hay not less than 50 per cent damage is estimated by Mr. Turner. What was stacked probably suffered not more than 10 per cent as a whole, with alfalfa less than that. Showers at this writing will increase the damage greatly if long continued, as cutting has progressed since the first rain.

Bean Damage Light.

Most of the beans cut before the rain were blackeyes and teparies. Damage to the latter is slight, and to the former not over 10 per cent. Quite a few Mexican reds, pinks, and red kidneys had been sown late as a second crop after grain or hay. These are not ripe and so were not damaged much.

Alfalfa Seed Demanded.

More alfalfa seed is being sold since the rain this fall by the Bomberger Seed Co. than at any time last year up to mid-January. Most of the sales have been for planting north of Modesto, where rains were heaviest, as fall planting depends on rain or subirrigation or pump irrigation. Gravity irrigation played out early in most districts.

Alfalfa Seed to Be Scarce.

Rain damaged the alfalfa seed crop so severely that much of it will not be threshed; and dealers who expected to ship East have had to give up these plans. Much of the seed, however, is simply discolored and not much damaged.

One Use for Bermuda Grass.

In going through a fruit orchard its owner remarked to us, "This Bermuda grass is a good thing to have in an orchard. It compels the farmer to cultivate." Most tillers of the soil are philosophers.

A Weatherproof Coat

In every Raynster there is a Raynster Label. That label assures you something more than just a raincoat. It is the sign of the best in weatherproof clothing of all kinds. It is the proof of full value for money received.

Buy a Raynster today and be sure the label is in it. Raynsters are good insurance of health and clothing for every member of your family.

There are Raynsters in all styles of weatherproof clothing. The heavy rubber surfaced kind for outdoor work; cloth coats suitable for dress or work, these are good overcoats as well as good raincoats; heavy ulsters that are warm and shower-proof, splendid for driving in cold or rainy weather. Raynsters are made for every member of the family and are priced according to materials and workmanship necessary to produce each particular kind—the label guarantees value for price—always look for it. Don't buy just any old raincoat when your dealer can get you a Raynster.

Write for a Style Book showing many Raynster models.

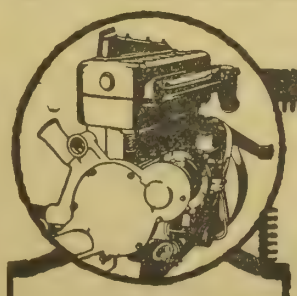
LOS ANGELES SAN FRANCISCO VISALIA



Correct Lubrication for the "L"-Head Type Engine

This, the "L"-Head type of automobile engine, like all *internal combustion engines*, requires an oil that holds its lubricating qualities at cylinder heat, burns clean in the combustion chambers and goes out with exhaust. ZEROLENE fills these requirements perfectly, *because it is correctly refined from selected California asphalt-base crude*

"Proven Entirely Satifactory"

Only perfect satisfaction can account for the use of ZEROLENE by the majority of automobile owners.

Leading coast distributors also testify that it is "a most satisfactory motor oil."

They know from the records of their service departments—and we know from exhaustive tests—that Zerolene, correctly refined from selected California asphalt-base crude, gives perfect lubrication with least carbon deposit. Get our lubrication chart showing the correct consistency for your car.

At dealers everywhere and Standard Oil Service Stations.

San Joaquin Valley Crop Notes

[Written for Pacific Rural Press.]

Merced County Crops.

Merced tomatoes every year are the earliest of any in the State except those from Imperial Valley, according to F. L. Landram of Merced, whose estimate of the 1918 shipments, based on crate material sold, is 150,000 twenty-pound boxes. Returns the past two years have been satisfactory to growers, who are very prosperous. No canning tomatoes are raised around Merced, and the shipping season is over by July 15. Italian Early and Early Stone are the principal varieties, with the latter increasing in popularity on account of better smoothness and larger size, though it is about two weeks later than the Italian Early. The fields have been free from disease or insect pests, the greatest danger being from frost in the spring. Earliest shipments are made by express, arriving on the Bay city markets the morning after shipment in the evening. A great many tomatoes were hauled by truck to Sacramento this year. Those destined for points within the State are generally shipped "in the blush" after color has come on one side and are practically ready for use on arrival at the consumers' tables. Those shipped out of the State go mostly to Oregon and Washington, leaving Merced green, but arriving at markets practically ready for use.

SWEET POTATOES.

Prices on sweet potatoes for this season surpass any previously received, having been $3 or more per 100-pound crate up to this writing, with possibility of lower prices for a period and then higher prices for stored stock, as surveyed by Mr. Landram, who estimates that about one-fourth of the shipping crop is stored by growers on their ranches. The shipping season starts about July 1 and sales from storage usually continue from December to March 15. Many early shipments go to Washington and Oregon, with a few to Denver. Last year the price did not go under $2.50, so growers are feeling prosperous. Yields per acre this year are hardly up to normal on account of water shortage.

GRAIN AND BEANS.

Yields of grain per acre in Merced county were not over 65 per cent of last year, as estimated by J. D. Wood of Balfour-Guthrie Company's local office. Some intended for grain was cut for hay and Mr. Wood estimates the acreage harvested at about 90,000 of barley and 12,000 of wheat. The latter was nearly a failure on account of the lateness of rain and its sudden stopping. This year's barley seems as yet to have no market and next year's wheat acreage will be a great deal more than ever before.

H. K. Huls, who operates the Merced bulk grain elevator, says that wheat will be planted on all clean summer fallow and half of the acreage will be Early Baart if they can get the seed. Club, Australian, and a little Bluestem have been raised, but Baart will be worth more than other varieties as recommended by the Sperry Flour Co. Barley cannot be moved at over two cents, according to Mr. Huls, and it requires recleaning, being full of oats due to careless cultural methods.

Bean acreage is three times greater than ever before, as estimated by W. D. Boyden of the Merced Elevator Co., and the yield is the biggest ever produced. Bean acreage in Merced county has always increased every year. Blackeyes and teparies lead in acreage, with a few Pinks, Red Mexicans and Large Whites always grown. Not enough beans have been threshed to set the price. Last year teparies were sold where they were not known, but Mr. Boyden says repeat orders will not come from either consumers or the dealers.

Atwater Sweet Potato Cannery.

Second sizes of sweet potatoes under about 1¼ inches in diameter are being bought at $25 per ton for canning by the Sunlit Fruit Co. at Atwater. This factory expects to can about 1500 tons, according to F. E. Simpson of the Sunlit Co. About 500 tons are being received from the Turlock district and the rest from Livingston, Atwater, Keyes, Arena, etc. Field run potatoes have been bought at $30 per ton, the large sizes being sliced and peeled at less cost and therefore able to be sold in the cans at the same price as the smaller ones. Loss by peeling, spoiled potatoes, etc., is figured about 34 per cent. The season opened up at $2 per dozen cans holding 1½ pounds net. The Government is taking most of them. The sweets are peeled by a lye process. The larger sizes are sliced and all are packed dry by hand, with no moisture added at any time. After packing in the cans, they are exhausted and cooked in retorts. Their appearance improves with passage of time after canning.

Turlock District.

The cantaloupe and watermelon deal is about over in the Turlock district, as stated by A. J. Eddy of

Alfalfa Seed

of known purity and germination is a big step toward better producing hay fields, but experienced planters are now demanding more. They insist upon planting seed particularly

ADAPTED TO THE NEEDS OF THE SOIL.

That is why there is only one trade mark that insures universal satisfaction. Besides being pure and of strong vitality our

BOMBERGER SEED CO.
725 10th Street, Modesto, Cal.
(DESK A)

The LAUSON 15-25
DUST PROOF-ALL GEARS ENCLOSED

Surplus Power

The engine is the heart of a tractor. It must supply a steady flow of power. There must be power to spare. Soil conditions increase the draft at the drawbar. Wet grain requires more power at the belt pulley.

The LAUSON-BEAVER-valve-in-head motor has 30% surplus power. The valve-in-head principle is noted for its efficiency under heavy load. It burns kerosene successfully. It is dust-proof but accessible. The bore is 4½ inches and the stroke 6 inches.

Pulls Four Plows

The LAUSON 15-25 is rated a 3-plow tractor. And yet in the National Tractor Demonstration at Salina, Kansas, it pulled four 14-inch plows to an average depth of 7½ inches at the regular plowing speed of 2¾ miles per hour through the entire demonstration week.

Designed for Belt Work

The LAUSON 15-25 is made to run the ensilage cutter, grain separator, corn sheller, feed grinder, rock crusher—any kind of belt work requiring surplus power.

Twenty-three Years of Engine Building Experience

For twenty-three years we have been making LAUSON Frost King Engines—the standard of farm engine excellence. 1½ to 28 H. P.

Entries positively close Oct. 5th. Make your entries NOW!

CALIFORNIA INTERNATIONAL LIVESTOCK SHOW
SAN FRANCISCO - NOV. 2-10, 1918

FULL POWER ON TURNS

BECAUSE OF THE SINGLE TRACK.

Will the tractor you buy turn in a 10-foot circle (5-foot radius) pulling as strong on the short turns as on the straight away—and will it do that without slipping one side or one wheel? That's of vital importance! Many tractors work well when pulling straight—it's on the turns that you get good or poor service from your tractor.

The Bean TrackPULL Tractor is the only small orchard-and-vineyard tractor made that delivers full power on short turns and it turns without slipping one side, pivoting, or doing anything else that a tractor shouldn't do.

Many tractors will turn themselves around all right, but the tractor you need, whether in orchard, vineyard or field work, must take the tools around too and keep them at work all the way around. This requires full power on the turns.

This remarkable machine is built on patented FRONT-DRIVE principle—you steer with the single track which does all the pulling whichever way you go. You can turn within the same row (see illustration above) without lifting out the tools, making as short a turn as with a team!

Absolutely no other tractor acts so like a team while doing three times as much, is so handy, so efficient, so staunch, and so protected against over-strain!

You'll want the Bean TrackPULL eventually. Send coupon at once for catalog, complete description, and name of nearest demonstrating agent.

Don't buy a tractor that does less. Don't do without one that does so much

Bean Trackpull Tractors
WITH INVALUABLE PATENTED FRONT-DRIVE

New Features in 1919 Model.

1. Motor—Improved oiling system; improved carburetor control, governor equipped.
2. Track Rollers—Provided with hardened steel thrust washers.
3. Drive Sprocket—Solid steel ring, machine cut, hardened and heat treated assures long service.
4. Bearings—Provided with improved dust-protected greasing facilities.
5. Rear Wheels—Provided with dust cap, wear-resisting bushings and improved greasing facilities.

Price advances to $1445 Nov. 1st. By taking October delivery you will get the latest model with all 1919 improvements at the present price of $1340.

Kind of crops grown .....

the Turlock Merchants and Growers, Inc., and confirmed by the writer's observations. Cassabas are still freely coming in. About 2800 carloads of cantaloupes have been shipped. A great deal of the planting did not mature crops on account of drouth, but on the whole yields per acre have been very good, the crop has reached Eastern seaboard markets in only fair condition due to delays en route, but prices have been exceptionally good. C. M. Stetson of Ceres reports cantaloupes selling by the carload at $6 and $7 per crate. The watermelon season was very profitable until about mid-September, when markets failed to justify further shipments. The wilt disease has not been so serious as in previous years, but aphis did some damage. Sweet potatoes are becoming quite a crop here, the Turlock Irrigation District having been asked for water for 2392 acres last spring, and the crop having yielded an average around 100 to 125 crates per acre, with the Sunlit Fruit Co. taking all second sizes for canning at $25 per ton to the growers. The price for shipping has not gone below 3c per pound to the growers f. o. b. Turlock and other shipping points. The T. M. & G. has shipped about 90 per cent of the crop from the Turlock Irrigation District and also has shipping sheds at Livingston and Atwater.

Beans and Corn.

Acreage of beans, gyp corn, milo, kafir, etc., in territory around Turlock has greatly increased, says Mr. Eddy, though in the Turlock Irrigation District there is not much increase. Beans are coming pretty well, but the yield will not be so much per acre as last year on account of short moisture. "Second crop" beans are doing well. Very few beans have come in for shipment yet, and the season has not opened up enough to quote prices. The warehouse was opened October 12 last year for reception of beans. Varieties this year are more blackeyes, Lady Washingtons, and teparies, with a few small whites, but fewer colored beans on account of poor markets for last year's crop of the latter. A number of carloads of teparies were sold last year to the Middle West, but this may not help in marketing the present crop.

Some gyp corn is already coming in. This comprises the greatest part of the corn acreage. It is yielding about average. Only that which was on the ground during the rain was damaged and it will mostly make No. 2 quality.

Labor Costs Higher.

Growers and shippers have had enough of labor as a rule, though prices were higher than last year, and it was notable that a larger proportion of older men were working. Field workers were generally paid about 50c per hour, non-technical shed workers the same, carloaders 60c and inspectors $7 to $8 per day. The contract price for picking, packing and labeling was 28c per crate for standards, jumbos, and ponies, and 14c for flats. The provision made by the T. M. & G. for housing helpers, as noted last spring in the Rural Press, proved so popular that there was generally a waiting list of applicants for the houses.

FALL ALFALFA SEEDING.

One hundred and thirty-five acres of alfalfa planted from December to February by A. S. Bomberger of San Joaquin county on well-drained sandy loam showed no difference in stand, vitality, weediness, or growth, though the December planting was frosted severely several times. To get benefit from early seeding other than to avoid the rush of spring work, Mr. Bomberger believes earlier fall seeding would give much better results and he expects to plant between 60 and 100 acres this October if possible. An important feature of fall seeding, however, is to have the ground relatively free from weeds, as after a clean-cultivated summer crop.

Mr. Bomberger, without experience on heavy ground, points out that actual freezing of the ground or of water standing at the surface of water-logged ground might easily kill the plants; but there is a considerable advantage and practically no danger in fall sowing on well-drained land in the San Joaquin Valley.

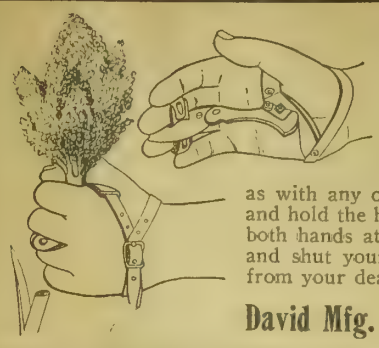
THRIPS REDUCES CROPS.

W. Stearns of Wooden Valley reports about half a crop of pears this year. The yield was light chiefly through the ravages of thrips. Prunes are a good crop with him, though they will run 20 points smaller than usual because of the dry season.

MOISTURE AND ALFALFA PLOWING.

The time to plow out alfalfa is when moisture has penetrated to the depth you want to plow, so the share will ride along the dry dirt and cut the roots easily, because they are firmly held from below.

The new Egyptian Cotton Association of the Imperial Valley is taking steps to erect its own gin at Imperial.



FOR HARVESTING
EGYPTIAN CORN
You can use both hands and cut twice as much in a day with the
DAVID HEADING KNIFE
as with any other instrument. You cut off the stalk and hold the head with the same hand—and you keep both hands at work, cutting as fast as you can open and shut your fingers. Pair (right and left) $2.50, from your dealer. *Dealer; order from any jobber.*

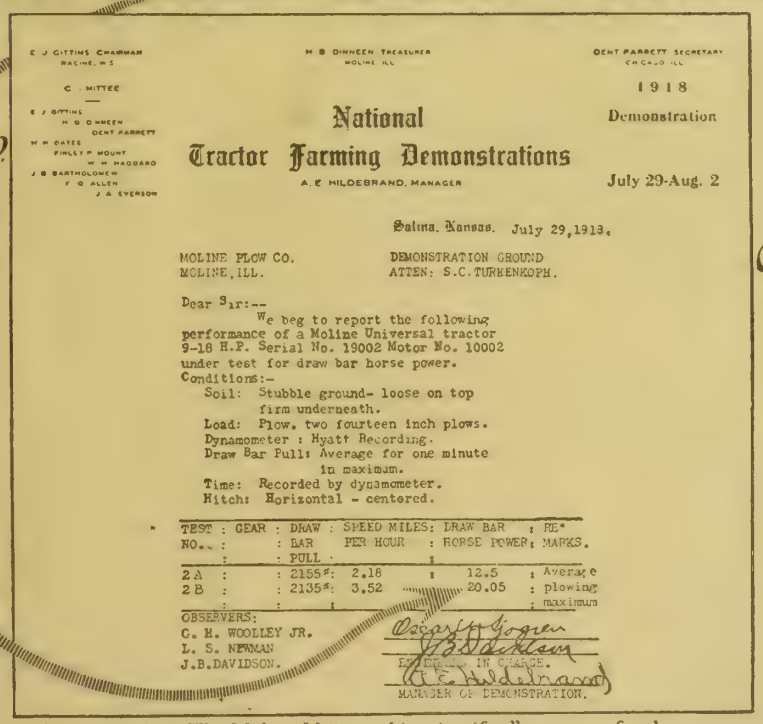
Moline-Universal Makes Wonderful Record at National Tractor Demonstration



E. J. GITTINS CHAIRMAN, RACINE, WIS.
H. B. DINNEEN TREASURER, MOLINE, ILL.
GENT BARRETT SECRETARY, CHICAGO, ILL.

1918 National Tractor Farming Demonstrations Demonstration
A. E. HILDEBRAND, MANAGER July 29-Aug. 2

Salina, Kansas. July 29,1913.

MOLINE PLOW CO. MOLINE, ILL. ATTEN: S.C. TURKENKOPH.

Dear Sir:--
We beg to report the following performance of a Moline Universal tractor 9-18 H.P. Serial No. 19002 Motor No. 10002 under test for draw bar horse power.
Conditions:-
Soil: Stubble ground- loose on top firm underneath.
Load: Plow. two fourteen inch plows.
Dynamometer : Hyatt Recording.
Draw Bar Pull: Average for one minute in maximum.
Time: Recorded by dynamometer.
Hitch: Horizontal - centered.

TEST NO.	GEAR	DRAW BAR PULL	SPEED MILES PER HOUR	DRAW BAR HORSE POWER	REMARKS.
2A		2155#	2.18	12.5	Average plowing
2B		2135#	3.52	20.05	maximum

OBSERVERS:
C. H. WOOLLEY JR.
L. S. NEWMAN
J.B.DAVIDSON.
ENGINEER IN CHARGE.
MANAGER OF DEMONSTRATION.

Develops 20 H.P. on the draw bar and we only rate it at 9 H.P. Think of it!-

Officially Accredited with 26.48 H.P. at the belt- We rate it at 18 H.P.

IN previous advertising we have stated that the Moline-Universal was conservatively rated at 9-18 h. p. Just how conservative is shown by the astonishing official tests made at the National Tractor Demonstration which showed the Moline-Universal to have an excess of over 11 h. p. on the draw bar and 8 h. p. at the belt.

Certainly these tests show beyond question of doubt the efficiency of the Moline-Universal. For each 169 lbs. of weight the Moline-Universal developed 1 h. p. on the draw bar. Compare this with the ordinary tractor which develops 1 h. p. for each 250 to 300 lbs. weight—and you will clearly realize the greater efficiency and corresponding greater economy of the Moline-Universal.

However, we shall continue to rate the Moline-Universal at 9-18 h. p. A tractor to give satisfactory service and stand up for years under the strain of tractor work must have reserve power, and the greater the reserve the better. Under normal conditions the Moline-Universal has from 50 to 100 per cent reserve power. Think what this means.

Ninety-eight per cent of its entire weight is on the two big drive wheels where every ounce is available for traction. The Moline-Universal is scientifically constructed and utilizes its weight to best advantage. It has no dead weight.

From the above report you will see that the Moline-Universal developed 20.05 h. p. at 3.52 m. p. h. pulling two plow bottoms 9 to 10 in. deep in exceptionally hard plowing. At 2.18 m. p. h. it developed 12.5 h. p. The difference in speed accounts for the extra draw bar pull. At 3.5 m. p. h. under average conditions the Moline-Universal will plow as much in a day as a 3-plow tractor traveling at 2.25 m. p. h.

Just the Right Size

If the Moline-Universal were built to pull a 3-bottom plow, it would be too heavy for light work. As the Moline-Universal is now built it has ample capacity for all ordinary plowing needs, and at the same time is equally suited for light operations such as cultivating, haying, harvesting, etc. which require far more work hours than your heavy work.

You are chiefly concerned in getting your work done quicker and better than you ever did before. You have no fixed power requirements. One day your work may be heavy, the next day light—and the light work is just as important as the heavy. Thus, you must have a tractor which will do both heavy and light work efficiently and economically, and the Moline-Universal fully meets both these requirements. You have plenty of power when you need it and when you don't want it you have no extra expense—as you would have with a heavy tractor for light jobs.

Remember this—here s what the Moline-Universal Tractor will do for you:

(1) Gives you plenty of power for all your work, both heavy and light.

(2) It does all farm work including cultivating.

(3) One man operates both tractor and implement from the seat of the implement in all operations.

(4) Electric lights enable it to be worked nights to make up for unavoidable delays.

(5) Because of self-starter, non-robust labor can operate tractor successfully.

(6) So well made and has so much reserve power that it will give many years of service.

Send for free catalog which gives detailed description of the Moline-Universal Tractor. Address Dept. 97.

Moline Plow Company, Moline, Illinois

Fuel Record 1½ Gallons Kerosene Per Hour With a 24"to 26" Thresher

WATERLOO BOY

ORIGINAL KEROSENE TRACTOR

This tractor is a record breaker in fuel economy. It is the first tractor built in which cheap fuel was a part of the original design and construction. Our patented inbuilt manifold transforms kerosene into a powerful gas and insures its burning all the fuel—no waste.

"I threshed 18,000 bushels grain this summer with the Waterloo Boy Tractor. It required 15 gallons kerosene and about a quart of cylinder oil for a ten hour day." E. C. Haraldson, Hanley, Sask.

As Efficient in the Field as at the Belt

The Waterloo Boy has a record of pulling any load eight horses can pull. Its simple, powerful motor sends driving force into both the large, wide rear wheels which grip the ground firmly, pulling three 14 inch bottoms 7 inches to 8 inches deep, without packing the soil.

Write for our free illustrated catalog. It contains many photographic views showing the Waterloo Boy at work on farms, with letters from their owners, also full description of the tractor.

Working parts easily accessible, dust proof gears, automatic lubrication, reliable ignition, Hyatt Roller Bearings.

Mechanical Power on the Farm

Tractor Demonstration Notes.

An Avery 25-50 tractor was slowly run up to a wooden block two feet square and three or four feet long, hooked its drive wheel grouser onto the block, climbed on top of it, backed down again deliberately, and then drove forward completely over it.

The W. L. Cleveland Co. had two different sized motor corn-potato-bean, etc., cultivators at work.

A charming young farmerette gaily drove an Avery two-row motor cultivator for F. H. Poss & Co.

F. T. Briles reports sales of 47 Cleveland tractors at the Los Angeles demonstration.

You might think the hard adobe provided good traction, but it was weathered an inch or two on top into a layer that acted something like a plate of ball bearings.

One tractor broke off the axle of its front wheel by dropping into a crack in the adobe on a turn.

After a Trundaar had pulled a Killefer single-standard subsoiler the length of the field, raising a ridge six inches high rounded off two feet wide, a yardstick was shoved into the gash about 21 inches.

Stiff tractor hitches on the P. & O. plows were mighty handy in backing them up for a new start when they dug their noses too deep into the adobe.

A Heider tractor operated a Wilson-Wetterhold grinding machine while a man pitched bean straw, alfalfa, husk-corn, milo, barley, and shelled corn into it at various times. It turned out a much more economical feed than it took in. The cylinder of flat iron plates looks like low upkeep costs.

Pushing a four-row bean cutter about the field, the Moline showed how beans could be cut without running or tramping over them. The cutter was suspended from an arm projecting from the front of the tractor. A lever raised and lowered it, being operated by rope and pulley from the driver's seat. The push of the tractor became a pull from the front end of the projecting arm to which the cutter was hitched.

The Union Sure-Grip tractor was practically the same as when shown at last year's Los Angeles demonstration except a little strengthening in a few parts.

The Rumely 20-40 straightened a plow beam.

The Russell had to wait while its plow was exchanged on account of a broken share and shank.

Five Oliver 14-inch moldboards built for the heaviest plowing were pulled to the hilt by the Best 75.

With the certainty of fate, the Holt 75, with its ten tractor disk plows, chugged along, leaving a beautifully finished job—after Mr. Davis came from Stockton and adjusted the disks.

The Lauson took a load it could carry without effort and did a fine job of plowing.

A 45-foot Forkner springtooth "tractor tiller" was pulled around every afternoon by a big Caterpillar.

The Appleton is a late arrival in California, being handled by C. S. Anthony since F. H. Poss Co. has taken over Avery tractors for the entire State.

The demand for disk gang plows is ten to one greater than for the same plows with moldboards which may be attached in place of the disks, according to J. H. Davis, plow inventor of the Holt Mfg. Co. Their disk plows have always been bolted to the I-beam frames, but the moldboards have been fastened by clamps.

Automatic Tractor Disk Harrow.

A new labor-saving implement for the heaviest cultivation by tractor is that shown and operated at the Los Angeles Tractor and Implement Demonstration, September 17 to 22, by the Killefer Mfg. Co. The disks were heavy enough to stand the gaff on the clods of hard, dry adobe bigger than water buckets which the tractor plows turned up. The new labor-saving feature is an arrangement of flat iron bars so attached to each other and to the disk frame that when the chain from the tractor was hitched one way it pulled the disks straight and when hooked by a right-angled hook into a special plate they were pulled to the angle desired. No labor of man or tractor was required except to loosen the strain on the pulling chains and place the hook or remove it while sitting on the tractor. Crossed iron bars and chains between the forward and rear gangs made the rear ones follow suit when the forward disks angled or straightened. The whole outfit is entirely flexible and carries a rack for a heavy load. It is made in five, six, seven, eight, ten, and twelve-foot widths, the eight-foot one weighing 1675 pounds. One man operates both the tractor and the disk without loss of time and without moving from his seat.

Portland Tractor Demonstration.

Fifty-four tractors of 25 different makes were demonstrated at Portland, September 5, 6, and 7, according to Eugene Smith, who managed that demonstration after completing his work on the one at Davis last spring. The demonstration was unusually successful from the standpoint of visitors and of exhibitors, and a great volume of business was transacted. All kinds of soil, hillsides and valley land were turned, under more nearly average farming conditions, than at Los Angeles. Mr. Smith says they had no such machinery exhibit as featured at the latter.

Inner Tube Suspended 376 Pounds.

A five-inch cross-section comprising one-twenty-ninth of a Norwalk inner tire was hung so it held the weight of a rock weighing 376 pounds. This stretched the piece less than two feet. The demonstrator remarked that the Government test for rubber is to stretch a five-inch section to 25 inches for 25 minutes. How nearly it returns to its normal size shows how nearly pure rubber it is. Only rubber of 95 per cent or greater purity will float, and the demonstrator showed that Norwalk tubes would float.

JOHN DEERE TRACTOR PLOWS

Give Special Satisfaction To California Farmers

Get These Books

Write today for our free booklet describing fully the John Deere Light Tractor Plows. It has a message on tractor plow value that you will find profitable to you. Ask also for our big free book *"Better Farm Implements and How to Use Them."* Its 156 pages describe a full line of labor saving implements—(tells how to adjust and operate many of them). It is full of practical information that will help you. Put it in your library. Use it as a reference book. It will be worth dollars to you.

To get these books, mention the implements in which you are interested and ask for Package PT 11.

It takes special tractor plow construction to meet the requirements of plowing in California.

John Deere Tractor Plows, No. 5 and No. 6, have that construction.

The development of their special advantages was directed by men who had made a close study of California tractor plowing conditions.

They have fully proved their special ability in the hands of California farmers and fruit growers during the past year.

These John Deere Tractor Plows are controlled by the wheels at all times because the axles are rigidly fastened to the beams. The land wheel is set back balancing the weight of the plow over all of the wheels and insuring even depth of plowing in uneven ground. The plows get down to position quickly and ***stay in the ground*** while plowing.

The land wheel and front furrow wheel are set so as to permit plowing close up to trees or vines in throwing either to or from the row.

Both levers are out of the way of limbs while the plow is at work.

The power lift for these plows is the simplest and most dependable ever designed. No chains or sprockets to cause trouble. A powerful clutch engages positively and raises the bottoms high and level.

There is unusual clearance between mold board and beams for deep or trashy-land plowing.

These plows are exceptionally strong in every part. Beams are warranted not to bend or break. Beam braces have an extra long lap. Large bolts and lock washers hold all parts rigidly to place.

Besides the special design end extra strength that particularly adapts them for use in California, these plows carry the genuine John Deere bottoms, favored everywhere because of their wearing, scouring and pulverizing qualities.

Their John Deere Quick Detachable Shares save time and labor without sacrificing strength or close fit. Loosen one nut to take the share off. Tighten the same nut and the share is on tight.

The hitch on the No. 5 and No. 6 is adjustable—it adapts the plows for use with any standard tractor.

You can get the size to suit your tractor. The No. 5 plow is furnished in two and three-bottom sizes; the No. 6 in three and four-bottom sizes. Ten, 12 or 14 inch cut.

Ask your John Deere dealer to show you a John Deere No. 5 or No. 6 Tractor Plow. Investigate the special advantages these plows have to meet your needs. You will find them fully dependable for better and longer service in California fields, orchards or vineyards.

The Rindge Company expects to farm 50,000 acres of land around Stockton the coming year. This company is the pioneer in hemp growing in California, also of raising corn on a very large scale.

General Agricultural Review

Field Crops.

The wheat interests of the State are taking action to convince President Wilson of the expediency of fixing a $2.50 price for the 1919 wheat.

The Government has placed a price of $66 a ton on cotton seed grown in the Imperial Valley and in Arizona—somewhat higher than the average price for seed.

In the sugar beet districts growers welcome the news that Federal Food Commissioner R. P. Merritt refuses to offer a fixed guarantee to the sugar refiners for their next year's product. The farmers feel sure their next year's product will bring a better price than this.

Wild ducks in the rice fields of Butte, Colusa, Glenn, Sutter, Yolo and Yuba counties may be shot whenever necessary to protect the crops, according to an official telegram from Washington. This ruling holds good until the 15th of the month. Only rice farmers, members of their immediate families and employees, however, may shoot the ducks, and they must shoot in open field.

In the Stockton section, wherever men were behind with their tomato picking, there has been considerable loss, while those who were well up with their work had much less loss of fruit. The keeping qualities of onions have been somewhat damaged, especially where they had not been pulled. Those picked had to be turned, but a good many have been sacked and put under cover. Potatoes are only affected on old land plowed shallow. Here a good many vines have been killed down and stunted the growth of the tubers. George Shima claims no damage to potatoes on his land.

Citrus and Semi-Tropical.

The commercial culture of the avocado in the foothill section around Oroville offers great promise, according to the U. S. Department of Agriculture.

Olives have been benefited by this season's weather and the fruit has increased in quality. The crop is expected to reach about 50 per cent of normal.

John P. Coy, Horticultural Commissioner of San Bernardino county, reports no change in the citrus crop report. He says most of the trees are looking fine—a few not up to standard but improving. No fumigation this year except a small amount in the west side of the county. Beans are looking fair, though the acreage is less than last year.

Deciduous Fruits and Nuts.

The Porterville Canning Company has been notified that all the product for the season will be taken over for the U. S. Army.

Orchardists living within auto-riding distance of San Francisco complain loudly of the thievish instances of pleasure parties passing their properties.

Visalia is finishing up her prune crop and will soon be all under cover. Prunes cost about $4.50 a ton for picking or nearly double the cost of a few years ago.

The Yuba City plant of the California Packing Corporation has finished the largest pack in its history. They packed 102,000 cases of peaches as against 96,000 last year.

Grapes.

Perhaps the highest price paid for a carload of table grapes is $3,353, which was the amount paid to the Pioneer Fruit Company for a carload of Tokay grapes in Boston.

The first order for 1918 California raisins placed by the United States Government was announced by the California Associated Raisin Company as amounting to 15,846 tons.

Tokay grape growers in the vicinity of Lodi have suffered less than was originally feared as a result of the early September storm. Some of the fruit being shipped from the old vineyards is as fine as ever left the district. The rains seemed to improve the color of the grapes.

ADVANCED PRICES SET ON 1918 WALNUT CROP.

The walnut crop of Southern California has been made and is now being gathered. It is somewhat larger than last year's—estimated at 33,000,000 pounds. C. Thorp, manager of the California Walnut Growers' Association, says the quality of the nuts is showing a marked improvement over last year's. The price committee met today and named the following prices f. o. b. California points for this season:

	1918	1917
Fancy budded	31½c	24c
Standard	29c	21c
No. 1 soft shell	28c	20c
No. 2 soft shell	25c	16½c

SIXTY-FIVE PER CENT ORANGE CROP FOR CALIFORNIA.

The San Francisco Bureau of Estimates predicts a 65 per cent orange crop for California this year, as against 50 per cent last. The condition of lemons is given as 86 this year, as against 55 last. The condition of the orange crop by counties is as follows:

	Navels	Valencias.
Butte and Sacramento	50	—
Fresno, Kern, Tulare	32	60
Los Angeles	70	88
Orange	85	85
Riverside	55	80
San Bernardino	55	80
Ventura	75	—

The 1918 sugar beet crop of the United States is estimated by the Federal Food Board at 6,359,000 tons, compared with 5,980,379 tons last year. California's production is estimated at 1,041,000 tons, as against 1,331,548 last year.

For years the standard of farmers everywhere—Mica Axle Grease. Its high-quality petroleum grease would alone make good axle grease. But the powdered mica makes it better. It can't gum or cake and it lasts twice as long. No hot boxes. Get a can from your dealer today.

"The Army and Navy will dig the Huns' grave, but We must furnish the Spade"

—*Billy Sunday*

By REV. WILLIAM A. SUNDAY

Uncle Sam's Liberty war chest needs filling again!

We have the cash to fill it as many times as he lifts the lid.

There are only two horns to this dilemma—*you* are either a patriot or a traitor.

The men on the firing line and on the battleships have turned from business, home, mother, wife, children, and they stand ready to give *their* lives and shield with *their* bodies us who remain at home.

We are unworthy to be thus protected, if we do not do our utmost to sustain them.

We must be one in our determination to win this war. We are traitors to the cause for which they are giving their lives, if we do things here that make their efforts harder.

Life is not worth living unless there is something to live for. *Life would not be worth living if that bunch of Heinies should win.*

That is why they cannot win. That is why we cannot lose.

What a mountain of crime God has on his books against that horde of Hellish Huns. What grave is deep enough for this thousand-armed, thousand-footed, thousand-headed, thousand-horned, thousand-fanged pirate of the air, assassin of the seas, despoiler of the earth and ambassador of Hell!

The army and navy will dig the grave, but we must *furnish the spade.*

Our boys will soon hang crape on the door of the Potsdam Palace, and the bands will play Yankee-Doodle and Dixie along the Rhine.

Uncle Sam is the cactus in the Kaiser's pillow.

Our boys have gone over to clean up on that fool bunch of Huns and it is up to us to supply them with whatever they need to finish the job. It takes money to keep the riveters riveting—the sawyers sawing—the machine guns spitting bullets and the grub wagon always on hand with the eats. There is nothing too good for our brave defenders.

Our vocabulary contains no words adequate to express our approval of the achievements of our government since we threw our hat in the ring. We are rich on top of the ground; we are rich under the ground and our rivers creep like silver serpents to the seas, bearing our products.

The children of England, France, Italy and Belgium are laughing once more because they are being fed from Uncle Sam's bakeshop. One carload of meat every two minutes, one hog out of every four, nine million pounds of meat a day—all going over to feed our boys. We are in this scrap to the last dollar, the last grain of wheat, the last day.

We will never stop until Germany dips her dirty blood-stained rag to the Stars and Stripes.

It's a whale of a job we've tackled, but we can and must put it over.

But you must help.

Don't whine. Don't knock. You can't saw wood with a hammer. Don't turn the hose on the fire; add fuel.

McALISTER & SON

CHINO, - CALIFORNIA

A Square Deal for California Dairymen

[By J. M. Henderson, Jr., Sacramento.]

[Editor's Note.—One thing about the Milk Producers' Associations of California that particularly impresses us is the fact that they were not formed as money-making enterprises for the originator, but instead were financed by him to supply an existing need for methods of handling and marketing dairy products that would yield dairymen a fair profit. In other words, instead of looking out for his own interests, Mr. Henderson worked to put the dairy industry of California on a more stable basis. Someone has said, "Blessed is he who, having found the highest task he is able to do, devotes his efforts to that task." In financing Milk Producers' Associations, in helping dairymen to secure better cows, and, in general, to encourage more efficient farming, Mr. Henderson has found his highest task, and he certainly is devoting his time, efforts and means to this good cause. In the following article he tells how the first Milk Producers' Association happened to be formed, and what organization is doing for California dairymen.]

THE Sacramento Bank, for the past fifty years, has been a large lender of money on farming property in all parts of the Sacramento and San Joaquin Valleys. In recent years I noticed a gradual deterioration of actual prosperity among the farmers, and most particularly among the dairy farmers. Naturally, it became my business to find the reasons and to determine a remedy. Agriculture is the foundation of all business. A prosperous agricultural community makes a prosperous State and nation; conversely, a poverty-stricken rural community makes a poverty-stricken nation.

There are so many definitions of prosperity it may be well to define it for this article. My definition of prosperity is what anyone would consider the fundamentals of contentment: a reasonable amount of work; a reasonable amount of recreation; and a reasonable opportunity for education, for advancement, and for the rearing of a family to be useful citizens.

There has been a gradual tendency for our rural populations to emigrate to the cities. The cities, as a consequence, have become congested with underpaid, half-starved populations, and the country communities have become less populous. There has also been a marked increase in the number of farms which have been leased to itinerant farmers and the decrease in resident ownership—which has proven so ruinous to the agricultural communities of England and Ireland.

Of all classes of farmers, I noticed the dairyman was the most injured. He was also the one least organized, and the one whose products were most freely exploited by the gamblers and speculators without his consent. He was the one most subject to the leasing evil, and still the one most essential of all branches of farming. We can do without almost any commodity before we can do without milk and butter.

I found that the middlemen, the gamblers, the produce speculators and others were very careful always to set the selling price of butter and milk by the private operation of the so-called public exchange. By the shorts and overs they established the price to the producer without consulting him in the slightest. Neither did they give him a voice on the exchange. These middlemen were well organized, but, oh, how they yelled when I suggested that the dairymen organize for mutual protection and for the establishment of price strictly on the basis of cost plus a fair profit!

There was no dairymen's association in Northern California a little over a year ago. For the purpose of establishing just marketing conditions; for the mutual protection and betterment of the dairymen of Northern California, through collective purchasing of feeds and supplies; through standardizing our products; through stimulating production by putting the dairyman on a business plane; and for the purpose of producing clean, sanitary milk from healthy, vigorous cows at the lowest possible cost to the consumer, I financed and organized the Northern California Milk Producers' Association. This is one unit of seven of the Associated Dairymen of California, which makes the movement a State-wide one. This association established an initiation fee of $5 per cow, of which fifty cents was payable in cash, and the balance in bankable notes. We had a very hard struggle pioneering, but after several months of endeavor succeeded in gaining 75 per cent of all the dairy cattle in Northern California in the association.

The association is operated strictly on a co-operative basis. We allow no member to sell milk, butter, cheese or any other dairy product except to the association, for which a reasonable fee is charged for operating expenses. Whereas a year ago the dairymen were selling milk at from seven cents to ten cents per gallon, which results in a tremendous loss to the producers, they now average close to twenty cents per gallon to the producer, but which still results in a net loss. But the end is not yet in sight. We are insisting on greater efficiency both in production and distribution. There are so many phases to efficiency, both for production and distribution, that I can merely touch on it here. We must have better cows that will give more milk with the same amount of feed. For this purpose we must have a larger distribution of purebred bulls among the ordinary dairymen. We must also have better methods of farming so as to produce greater tonnage of feed with the same amount of labor. We must also have better and cheaper methods of handling the distribution of milk.

We must eliminate the handling of milk several times after it gets to the cities. Would it not be silly to have two postmen delivering mail in the same block when one could do it so much more efficiently? Similarly, it is very silly to have two or three milkmen delivering milk in one block, when it all could be delivered by one milkman getting his supply from the central depot. This is among other reforms to be inaugurated by us, and will be most insistently forced to the front from now on.

There has been considerable agitation in the large cities to make the distribution of milk a public utility, and to put it under State control. Some of those who have agitated for this reform do not realize that milk is actually sold in California today by the producer at a net loss to himself. It follows that our association must advertise its purpose and educate the consuming public to the fact that all the dairyman asks for is a fair legitimate profit. And he is entitled to have it. You cannot ask any business man to sell his products at a loss. It is one of the aims of our association to produce and handle dairy products so efficiently that one can secure a better price to the producer and at the same time do justice by the consumer. We want to eliminate waste, get all the value from the by-products of milk, establish chemical works for the manufacture of albumen, sugar of milk and other by-products. In this way we will earn our way quickly both to ourselves and to the community at large.

It is astonishing how many poor cattle there are in the United States, when there is so little excuse for it. The agricultural colleges and private investigators have determined beyond any doubt the great value of a

purebred sire in improving the milk production in an average dairy herd. It is the duty of every banker to help educate the farmer in his community to the benefits of a purebred sire, and to help finance those dairymen who want one but lack the cash to buy one. I am practising what I am preaching. I have financed hundreds of dairymen who want purebred bulls, and stand ready to continue to do this in the future.

The average dairy cow throughout the United States will not average more than 3500 pounds of milk in a year. There are many herds of purebreds in the United States that will average 10,000 pounds of milk per year. A sire from one of these herds naturally will transmit the same tremendous production with practically the same feed consumption. Nearly every dairyman can see the logic of getting a purebred sire and is actually anxious to get one, but due to natural timidity and lack of funds continues to milk his inferior cows year after year, and to use the same worthless scrub bulls. All he needs is a little education along the right direction by such associations of dairymen as ourselves and the aid of progressive bankers. I need not say that the banker is repaid for his enterprise a thousand fold in increased business due to greater prosperity throughout the community.

To summarize: We bankers owe to ourselves and the welfare of our communities to encourage efficient agriculture. A prosperous agriculture means a prosperous community as a whole, and will increase our new prospects. There are several methods by which we can be of assistance—by the organization of co-operative farmers' associations; by the encouragement of better livestock; by the distribution of purebred bulls, rams and boars, and by aiding from educational channels greater efficiency in both production and distribution.

Judging Program for Liberty Fair

[Written for Pacific Rural Press.]

The Livestock Show will be held from October 20 to 26. The barns and sheds will be open for the reception of livestock from October 15 to 20.

Sunday, the 20th, and the forenoon of Monday, the 21st, will be devoted to "weighing in."

Monday afternoon at 2 o'clock the Livestock Show will open with a grand march of livestock.

At 3:30 Monday afternoon car lots of cattle and hogs will be judged; also the individual steer classes. The judging of Chester White hogs will begin at the same hour.

Tuesday morning, promptly at 9 o'clock, the judging of Shorthorn and Holstein cattle, draft horses, Poland-China hogs and milch goats will begin.

Wednesday morning at the same time will begin the judging of Hereford and Jersey cattle and Berkshire and Duroc-Jersey hogs.

As fast as the judging of the above breeds is finished, that of the other breeds of cattle, swine and sheep will commence. The judging of horses and cattle will be under one tent and that of hogs, sheep and goats under another.

Only the judge, superintendent, clerk and herdsman will be allowed in the arena while the judging is being done, but after the ribbons are awarded in each class the public will be given five minutes in the arena to inspect the animals at close range. However, they will not be allowed to touch the animals, as handling by strangers makes them nervous and leads to trouble.

It is expected that the judging of livestock will be completed by Friday noon, and at 2 o'clock there will be a grand parade of all the prize-winning animals. Here the spectator can see gathered together the "best in the West" of all kinds of livestock—something that would require hundreds of dollars and weeks of travel to see in any other way.

BERKSHIRE SALE AT LIBERTY FAIR.

You realize that the future for swine breeders is bright, and you want to get into the game. You have decided that the Berkshire is the hog for you, and you want to purchase a few high-class animals. Yet you have no money to squander and are afraid to trust your own judgment in selecting stock. Isn't that about your position?

If so, the Berkshire sale to be held Thursday, October 24, at the California Liberty Fair, Los Angeles, has been arranged for your particular benefit. For not only have the leading breeders of the State made real sacrifices and consigned some of their best stock in order to help beginners get started right, but the Berkshire judge will inspect the stock before it is put up for sale, and all animals not up to a very high standard will be culled and sold to the butchers.

So, no matter how little you know about the fine points of a hog, you will run no risk in bidding on any animal offered at this sale. You will be sure to get one that is of the proper type, has good feeding qualities, will prove a good breeder, and will make money for you.

Be sure to attend the fair on Berkshire day, Thursday, October 24. See the killing contest in the morning and be at the sale in the afternoon. Even if you don't intend to buy, take it in anyway. It will prove a liberal education in hog types and values.

Under orders of the Butte county division of the State Council of Defense, all warehouses in the country must place armed men around the buildings where grain and other food products are stored.

The Farm Center of Chiles Valley, Napa county, at their last meeting had up the question of a stock yard, with the idea of buying all hogs for sale and holding them for a good market.

He Taught Us How

UNTIL recently most of us thought milking to be simply a matter of pull, pull, pull. Some think so yet. But it's not. If you watch a calf's tongue when he swallows you'll see the difference.

He gets his mouth full of milk—then he swallows. And as he does, his tongue massages the teat backwards from tip to udder.

That's Nature's provision for the prevention of congested blood in the teat as a result of the calf's sucking. Sucking draws the blood to the tip of the teat. The tongue massages it back to the udder.

EMPIRE MILKING MACHINES

with our new Super-Simple Pistonless Pulsator accomplish the same result. Stops the sucking and lets air flow in between the rubber lining and the walls of the teat cup.

This makes the rubber lining gently massage the teat *from tip to udder*, just like the calf. This action occurs regularly from 48 to 52 times a minute.

With our pistonless pulsator, there are no more leaky pistons resulting in irregular, nerve racking action. The suction is always uniform and gentle. Soothes the cow and results in far greater milk flow. Our local dealer will gladly show you the "Empire" without obligation. Call on him. Write for our new 1918 catalog No. 45

Stop Cream Waste!

$20 more profit per cow every year is the *average* gain of farmers using Viking Separators. Many do far better than that. Proved by carefully kept records of thousands of Vikings.

Don't let the valuable butter-fat dollars slip away in the skim milk through ordinary separators. Get *all* the butter fat that is in the milk with a

VIKING CREAM SEPARATOR

Guaranteed to skim to three one-hundredths of one per cent! No separator at any price gets a higher percentage of cream. Greater capacity than others of equal rating. Mechanically superior. Easy to operate (starts at a touch on the handle). Simple in construction and easy to clean. Lowest in price because it is made in the *largest cream separator factory in the world.* Guaranteed for a lifetime. More than one million in use, in all countries of the world. Look up the *Viking* dealer and investigate. The *Viking* is a money maker for you.

SWINELAND FARM,
W. O. Pearson, Prop. Woodland, Cal.

California Breeders have sold more than **$350,000.00** worth of registered cattle in our sales, under the most stringent requirements laid down by any sales organization in America. Satisfied buyers have been the rule in all our sales.

CALIFORNIA BREEDERS SALES & PEDIGREE CO.
C. L. HUGHES, Sales Manager, Sacramento, Cal.

GINN HOLSTEIN HERD TO BE DISPERSED.

Readers will remember that when W. H. Ginn & Son of Corcoran sold their grade Holsteins a few years ago and went into the purebred business they bought nothing but the best.

An opportunity is now offered others to make a similar start, for the entire herd of 90 head is to be dispersed in order to dissolve the partnership. Think of it! This is not a sale where a breeder wants to get rid of some undesirable stock. You can get the very foundation animals that have made the Ginn herd famous. This includes the herd sire, Aralia De Kol Pontiac Salambo, with 25 of his daughters and 34 cows and heifers in calf to him. Twenty-four of the females are daughters of Merci Sir Pondyke, who is by a son of King of the Pontiacs. Royal breeding here.

And you run no risk, for every animal is guaranteed to be a breeder; every one over six months of age is tuberculin tested and sold subject to retest, except a few of the older cows that will be sold as represented on sale day.

The sale will be held Thursday, October 10, at 9:30 a. m. It will be conducted by the California Breeders Sales and Pedigree Company, and Col. Ben A. Rhoades will be on the block.

BARGAINS AT TREWHITT SALE.

The W. D. Trewhitt dispersal sale of Poland-Chinas, held at Hanford, September 26, brought out a goodly number of spectators, but only a few real buyers. Consequently, most of the animals were picked up at bargain prices.

W. Bernstein opened the sale with a talk about the good qualities of Poland-Chinas, and his short talks throughout the sale helped to make it a success.

The heaviest buyer was T. R. Carlyle of Sanger, who bid in 16 head for $1,360. M. Bassett of Hanford could not resist the temptation to add six of the best to his already fine herd. Alan Milnes of Riverdale found five to his liking, and J. T. Boyd picked five very good ones to start a new herd at Tipton. The bargain of the day was secured by F. E. Fay of Tipton, when Jumbo Equal, the herd sire whose daughters topped the sale, went to him for $85.

Other buyers were A. J. Vancluf, Riverdale; B. M. Hargis, Tulare; W. Bernstein, Hanford; E. R. Eichner, Selma; H. D. McCune, Lemoore; A. Buckland & Son, Fresno; C. G. Hamblin, Hanford; Dr. R. Wilson, Laton.

Col. Ben A. Rhoades cried the sale in his customary entertaining way. Forty-six head brought $4,010, an average of $87.17.

HANFORD POLAND-CHINA SALE.

The mere mention of a sale by the Kings County Poland-China Breeders' Association ought to have the pulling power of a magnet to draw prospective buyers to Hanford. These sales have been held for over three years, this one being the sixth semi-annual sale. Each succeeding one proves better than the last. Buyers are enthusiastic over their purchases and come back for more.

Kings county is the leading Poland-China section of the State, and at this sale, to be held October 9, at the Fair Grounds, 80 head of registered sows and boars from the leading breeders will be offered. For size, bone, strong backs, good feet, easy feeding qualities, and all that goes to make a profitable hog, you can't beat the kind found in Kings county. Plan to attend this sale and take home a few choice animals. F. D. Ross, secretary, Hanford, will be glad to send you a catalogue.

Holstein buyers who want real quality can now get it at the M. Holdridge herd, San Jose. On account of a change of location, it is necessary to reduce the herd, and animals of both sexes and all ages are offered at attractive prices.

You Can Turn Your Damaged Hay Into a PROFIT

Buy a bunch of

Creamcup Holsteins

and make up your losses.

Holstein cattle are good feeders and not over particular: They will turn your losses into gain.

We have sold our Modesto ranch and have all our stock at San Jose and are crowded for room.

We offer a string of mature cows, a string of young cows; some bred heifers and a bunch of fine heifer calves. We also have a bunch of young bulls priced so low that you can grow them at a profit.

Call and see them on Alviso Road, one and one-half miles beyond city limits, out North 1st St.

Registered Guernsey Cattle

THE herd of registered Guernsey Cattle at Elliott-Brant Rancho, have won first, second or third in every class in which they have been shown, and the Junior and Grand Championship at the California State Fair.

Many of the largest records for milk, made in the west, have been made in this herd and the World's Record in the Roll of Honor class was made by a four-year-old cow of this herd.

This Guernsey milk has won the Gold Medal at the California State Fair and has won first in the Los Angeles Health Board tests five times.

Our herd sire is of the richest blood of the breed, and his sisters and brothers have world records both for price and records made.

We have bull calves, from Advanced Register cows with records up to 750 lbs. of fat, for sale at reasonable prices. Write for information regarding them.

We will show at the California Liberty Fair, Los Angeles. Do not fair to see our Exhibit.

ELLIOTT-BRANT RANCHO

OWENSMOUTH - - CALIFORNIA

THIS BULL Will Increase Your Butterfat

He is out of a daughter of Prince Riverside Walker and is a typey son of Model Francis Glista. Both of the above bulls are out of great producing families. Write or come and see him and other Holstein stock we have for sale.

The Mysteries of 'Mill Run' and 'Mill Feed'

[Written for Pacific Rural Press.]

Before the general use of wheat flour substitutes the term "mill run" indicated in California markets that the material was composed of the bran, shorts, and dark middlings that were removed from the wheat in the process of milling. Usually the finer and more or less white middlings had already been separated to use in making a cheap grade of flour.

Under present conditions much by-product is taken from the various substitutes for wheat, and these are being mixed with the material known as "mill run." Most of these new by-products are coarser and less desirable for feed than the material from wheat, and to make it marketable the millers now use the middlings that were formerly sold separately to make what is now known as "mixed feed." There is no standard mixture as yet; each lot is appraised on its merits, according to what it may happen to contain.

Inquiries have been received at the office of the Rural Press lately relative to mill feed prices and where the same may be obtained. It is just as well for stockmen to realize that mill feeds are extremely scarce as well as high priced, and that less dependence must be placed on mill feeds and resort had to such feeds as barley and oats.

As a result of inquiries this week at the headquarters of two of the leading milling companies of this coast, it was learned that they have no bran, shorts or middlings, as such, for sale. These mills now make "mill run" only, and orders for this commodity are booked far ahead of the visible supply. Sperry & Co. inform the Rural Press that orders for lots in excess of ten tons will not be received.

One of our correspondents is particularly solicitous about obtaining millstuffs for his hogs. As a substitute for the almost unobtainable mill feeds, he is recommended to try ground (not rolled) barley, with 5 to 10 per cent tankage or skim milk (or buttermilk). This makes an excellent ration. If tankage is fed, use 10 per cent for growing stock, but only 5 per cent for finishing off.

No patriotic farmer will feed wheat to his stock in these times of war stress, no matter what the price advantage, unless no other suitable feed can be had. If his cupidity gets the better of his patriotism and he insists on serving up wheat to his four-footed boarders, he runs the risk of being called to account by the Food Administration for so doing. Some wheat stocks have been confiscated already where their possession has been abused.

SCOURS IN PIGS.

To the Editor: I have several litters of pigs that are scouring badly. What is the cause of this, and what should I do to overcome it?—J. L. D., Imperial.

[Answered by Livestock Editor.]

This is generally caused by the sow catching cold, by overfeeding her, or by a sudden change in her diet, resulting in an acid condition of milk, which is transferred to the pigs. It should be checked promptly or it will stunt the pigs.

If you are using a stock powder, give the sow one-half pint for every 200 pounds of her weight, once a day for two days in succession; then once a week. If you are not using stock powder, add a tablespoon of baking soda to her slop twice daily.

Carruthers Farms
LIVE OAK CALIFORNIA

BERKSHIRES

Our entire show herd will be seen and later sold at the Western Berkshire Congress sale, October 24, Liberty Fair, Los Angeles.

This includes LIVE OAK CHAMPION, Reserve Grand Champion, and LIVE OAK LAUREL, First Prize Yearling Sow at the recent State Fair. Also the entire herd bred by exhibitor, and which took First Prize.

SHORTHORNS

At the Los Angeles Liberty Fair we shall show the white bull, HALLWOOD VILLAGER; the two-year-old heifer, BROADHOOKS SULTANA 2ND, grand daughter of Whitehall Sultan; the white heifer, LADY ROBERTA; the yearling heifer, MAYFIELD URY; and a roan heifer calf, daughter of Hallwood Villager.

Are You Breeding to a Standard?

[Written for Pacific Rural Press by R. H. Whitten.]

"Don't ask me about my stock," said a young breeder who exhibited at the State Fair this year. "I'm disgusted. Not with the judging, but with myself. I have been breeding registered stock for three years and I thought that I knew type. I thought that my stock was good enough, to win here this year, but look at the results. I won very few ribbons, and no high ones at that.

"PENNY WISE AND POUND FOOLISH."

"What's the reason for it? Simply that I kept my nose too close to the grindstone. I read books and papers and bulletins on livestock, and thought that I knew the game, but I failed to attend the fairs where representative animals of the breed are brought together, and the result is that I have been breeding an entirely different type from that favored by the judges. So I've got to get a new herd sire of this type and go through the slow process of breeding up my herd. This will set me back several years and will mean a loss of thousands of dollars to me, all of which I could have saved had I not been 'penny wise and pound foolish.' I thought that I was saving money by not going to the fairs, but I find that it really was the dearest kind of extravagance."

One more illustration before we attempt to draw our moral. Another young breeder was similarly disgusted with himself because he had failed to keep abreast of the times by attending fairs regularly. He won only a few fourth and fifth prizes, but instead of being sore at the judge he went to him and asked why he had not been awarded more ribbons. "And then I was treated to the surprise of my life," he said in discussing the matter, "for I learned from my talk with him that many of the animals I had at home in the pasture would have stood in greater favor had I brought them.

"So I am going home to get those animals in shape for the Liberty Fair at Los Angeles. I am not going to take any more animals to that show than I had at the State Fair, but I am going to win three times as many ribbons, because now I can pick the animals that will measure up to the scale of points and please the judge."

So here we have two true experiences; two good reasons for the existence of fairs; two good proofs that a circuit of fairs is much better than only one fair in a season. And the moral of it all is—learn the type that is wanted, breed for it and stick to it.

SHOW AND BREEDING TYPE IDENTICAL.

The old argument that show type and breeding type are so widely different that intelligent comparisons cannot be drawn is a back number. Time was when there seemed to be little correlation between the types represented at the shows and the animals at home that did the best work. But that time has passed, and standards have been established that are raised to the plane of greatest efficiency and highest practical worth. It has been proved that beauty and production can go hand in hand.

SHOW ANIMALS BREED WELL.

Furthermore, the theory that show animals do not breed well and do not reproduce their kind has been exploded. Take Poland-China hogs, for instance, and only the Illinois and Iowa State Fairs this year. At Illinois a junior yearling, the largest ever shown there, was made grand champion, and he was a son of a grand champion of last year. The grand champion sow at the same show was a daughter of the grand champion sow of the world last year, and sired by the grand champion boar of Illinois last year. The junior champion sow was a litter mate to the junior champion boar.

At the Iowa Fair the grand champion boar was sired by the grand champion of Illinois in 1917, out of the grand champion sow of the world of 1917, and a litter brother to the grand champion sow of Illinois this year. The grand champion sow was a daughter of the grand champion boar of the world in 1916. The junior champion sow was of the same breeding as the sow that won the junior championship of the world last year.

That's the way it goes everywhere. Champions and grand champions this year are sons and daughters of previous champions and grand champions. Winning animals are brothers and sisters, half brothers and half sisters to the winning animals of previous years. And each show demonstrates that, one with another, the type and conformation of the different champions and winners shows great similarity.

Sires of this type—strong in breed characteristics—will stamp their good points upon their offspring and quickly build up a herd.

FARMERS WANT SHOW TYPE.

Besides this pleasing uniformity of type, this definiteness of blood line value, and the consistency of the judging at different shows, it is important to note that the buying of breeding stock shows a marked tendency toward an appreciation of the blood and type of prize winners—not only in the winning animals themselves, but in those that have been kept at home in the breeding pen. In other words, the judgment of the show ring judges has been vindicated by the hard-headed farmers who buy for production and profit only.

MUST HAVE DEFINITE AIM.

So if we expect to reach the goal of success in livestock raising we must learn what the best type is and then breed for that type. Blind effort will not bring success in this or any other line. No matter how hard a man may work, he can't accomplish the best results without having a definite aim. He can't use his powers to the best advantage when he is simply trying to do his best. He must have a goal to reach; he must have a strong purpose to unify his efforts and give direction to his powers.

Suppose a sculptor went to work in a dreamy way and knocked out a

chunk of marble here and there, without any idea of what he was going to create. What would be the result? He would have a rougher piece of stone than the one nature gave him. As some great man has said, "He who cannot see an angel in the rough marble can never call it out with mallet and chisel."

BREED FOR IDEAL TYPE.

And, similarly, he who does not see an animal of the ideal type with his mind's eye will never be able to raise animals of ideal type. Why, an army of soldiers firing at random would accomplish no less than an army of breeders who have no particular aim in their breeding operations beyond the natural increase in numbers.

We must do as little Johnny did with his banty hens. He was not satisfied with the size of their eggs, so he got an ostrich egg, tied it to a beam in the hen coop, and hung a card above it with these words on it: "Keep your eye on this and do your best."

We must profit by Johnny's advice to the banty hens, and aim high. We must keep before us constantly a mental picture of the most approved type of the kind of animal we are raising. And the place to form that mental picture is on the fair circuit. As Prof. Simpson of the University of Missouri says: "The fair circuit is the school of the constructive breeder. Few men attain outstanding success who are not close students of show ring standards and awards."

SHOW RINGS DETERMINE CORRECT TYPE.

You, Mr. Livestock Man, are in business for just one thing—profit. So it is up to you to attend as many as possible of the different fairs that are being held this fall and winter, that you may see the best specimens of the breeders' art, make comparisons, get ideas of preferences, and establish a definite type in your mind—the correct type.

Perhaps you will find it necessary to buy a few new animals to develop the right type in your herd. If so, you will find a fine assortment to choose from, and you need not hesitate to invest considerable money in good foundation stock, for the vision of the breeder's future was never brighter than it is today. The demand for high-class breeding stock, as well as for meat, dairy products and wool, is almost insatiable. It is bound to increase constantly while the war lasts, and will continue for many years after the scrap is over.

Furthermore, while the prices of livestock will continue high, the prospects for cheaper feed this season are excellent. Barley is already selling at a price which makes it a most profitable feed, and the recent abundant rains give promise of a green fall and winter.

So this is the time to get into the livestock game, or to carry it on more extensively if you are already in it, and to breed your herd up to the highest approved standard. And this means—attend the fairs.

Paste the dates in your hat—California Liberty Fair, Los Angeles, October 20 to 26 (livestock show), and International Livestock Show, San Francisco, November 2 to 10. Plan now to attend. You can't afford to miss them.

DAIRY STEER GAINS.

One hundred dairy steers gained 365 pounds in 115 days last spring for W. W. Cochran of Imperial county. The steers were yearlings of mongrel breeding and very thin. They weighed 450 pounds when the feeding began and 815 pounds when marketed.

During the first thirty days they received all the silage they wanted, plus about three pounds of cottonseed meal per day. The second month the meal was increased to five pounds, and the third month to seven pounds. Twenty-five days before the finishing was completed the silage ran out and they were fed cottonseed hulls and eight pounds of the meal.

If you want to raise milch goats successfully, write to the University of California for particulars about the new correspondence course now being offered by them.

Perris = = California

BUY BERKSHIRES for PROFIT

They are the best hogs for business farmers, for they make the highest priced pork from the lowest priced feeds. Noted for their prolificacy, prepotency and easy-feeding, quick-maturing qualities.

GREAT LIBERTY FAIR SALE

50 HEAD--MOSTLY BRED SOWS--FEW CHOICE BOARS

Here is the opportunity you have been waiting for to get choice breeding stock at your own prices.

The leading breeders of the State have selected some of their best stock—even their prize-winners—in order to place the right kind of foundation stock in the hands of beginners.

The names of these breeders alone are enough to guarantee the quality of the stock.

It is just the kind you ought to have to start you right and insure your success.

FOREST GROVE LAUREL 2ND.
Her daughter, Live Oak Laurel, will sell.

Maplewood Stock Farm, Calistoga, will consign their State Fair Junior Champion Boar, Maplewood Royal Prince 3rd.

A. B. Humphrey, Escalon, will offer two winning senior yearling sows; also a winning boar pig.

Carruthers Farms, Live Oak, will sell their entire State Fair show herd of ten head, one of which will be Live Oak Laurel, daughter of Forest Grove Laurel 2nd.

F. L. Hall, Perris, will consign 12 sows, several being daughters of Rival Champion's Best, and the rest granddaughters.

Other consignors will include:

Jas Mills Orchard Corporation, Hamilton City.
Anita M. Baldwin, Santa Anita.
Frank A. Brush, Santa Rosa.
Homer Hewins, Calistoga.

REMEMBER THE DATE—Thursday Afternoon, October 24th

This will be Berkshire Day at the Fair. Plan to attend on that day and be sure to take in this great sale. It will prove an eye-opener to you.

Now is the time to get into the game; the Berkshire is the hog to bank on. The kind you buy at this sale will put money in the bank for you.

Noted Lecturer Endorses S. F. Show

[Written for Pacific Rural Press.]

"In my judgment, the best thing that could happen to California is a livestock show of the proper kind," declared Dr. George Wharton James, the noted California writer and lecturer, in discussing the livestock situation in California. Dr. James has been conducting a series of interesting lectures at the Land Show at the Civic Auditorium, Oakland, and besides his favorite topic, "The Missions and Padres of California," he is merging his knowledge of agriculture and horticulture of the West with its economic complement—the raising and breeding of livestock.

"California can compete with any livestock market in the world," declared Dr. James, in discussing the California International Livestock Show to be held in San Francisco, November 2 to 10. "When I say California I mean, of course, potential California, for the State has not come into its own yet. To my mind it is the economic solution of the country. First we raised livestock in California. The days of the Dunphys and the Millers, and other noted families, is now a matter of history. These men of wealth and vision brought to California the first purebred livestock. Then the State gradually went into agriculture, and vast fields of grain and alfalfa were grown. Finally it became a State noted for its horticulture. But for a long time the need of something more than what we are doing has been apparent.

"I have been a student of California for nearly fifty years; first its producing possibilities, and then its landmarks and its literature. I can see no other message to the Californian now than that sent to them by the United States Food Administration, 'Produce, and then produce more.'

"Isn't the handwriting right there on the wall? If we were to produce only that which can be produced from the soil, we would be fulfilling our best efforts. We must produce livestock and we must show the people how it can and should be done. California's wealth lies in her future in livestock. Why, the things essential for such production are right here—climate and food and water. Consider the possibilities of California: First, climate; never too hot nor too cold to suffer a hardship to cattle; feed of the very best quality and plenty of it; the alfalfa of the meadows and the grass of the mountains.

"It is well known that in Merced and Stanislaus counties, where there is alfalfa and barley and pumpkins for the summer feed of cattle, the milk is of the highest quality and flavor and contains the most butterfat, and that the products sell for the highest price. Cheese, butter, malt products with milk and condensed milk itself in these valleys are all of the finest quality, and the most saleable and desirable.

"The weeding out of the mongrel stock for the purebred stock, of course, must follow the livestock industry. But, do not think for a moment that because livestock is the pursuit of many wealthy land owners it is altogether a wealthy man's occupation. It is not. Livestock raising is what will make the country wealthy. It will help the poor man to become rich with the country.

"We must all help in this big war program, and the best way we can help is to produce. We must make possible that which will put our products to the very best use. Show me a country that is a livestock country and I will show you the wealth."

The call of the California International Livestock Show is being answered every day. Besides the entries from our own State, they are coming in every day from all parts of the West, and from the most noted breeders. For instance, H. C. Lookabaugh of Watonga, Okla., will show his famous Shorthorns; Maxwell Miller of Steamboat Springs, Colo., his Shorthorns; William Harrell of Phoenix, Ariz., a carload of Herefords; Frank Reed Sanders of Chandler, Ariz., both Holsteins and Dutch Belted cattle; Thomas Pioneer Stock Farm of Bushnell, Ill., a carload of draft horses; Hereford Corporation of Wyoming, Herefords; J. Schilling, Arroyo, Colo., Duroc-Jersey swine and Hampshire sheep; University of Nevada, Herefords and Corriedale sheep.

In addition to the regular livestock show of cattle, hogs, sheep and draft horses, there promises to be one of the best horse shows ever presented west of Chicago. In style and quality of horses it will bear comparison with such pretentious horse shows as those held annually at Piping Rock, Long Island, at Tuxedo, Saratoga, or Ontwentsia, Chicago.

There will be about forty Eastern horses from noted stables, and about sixty from California, Washington and Oregon. Premiums amounting to $10,000 are offered.

While the horse show will not open formally until November 4, all of the horses will be on exhibition in their stalls the opening day of the Livestock Show, November 9, closing one day before the Livestock Show itself.

Judges so far selected for the livestock show are: Will Reese, Pilzer, Neb., Shorthorns; Robt. Mouser, Cambridge, Neb., Herefords, Angus and steers; William Gillette, Iowa Agriculture College, dairy cattle; Thomas Shattuck, Hastings, Neb., Poland-Chinas and Durocs. Other judges will be announced later. Five hundred dollars in special prizes for Aberdeen-Angus cattle has been offered and $250 has been offered by the Western Berkshire Congress for Berkshires.

All who are thinking of showing livestock should remember that the entries will positively close October 5. Don't wait until the last minute. Send 'em along now.

fered by the National Association,

Meet Us at the Liberty Fair

Are you expecting to buy or sell any stock at the Liberty Fair? Do you intend to investigate milking machines, or silos, or other modern equipment? Are there some puzzling questions that you would like to have answered? Simply hunt up a Rural Press man and let him help you. You won't find him inside of a booth, hollering like a barker at a sideshow and frantically endeavoring to get subscriptions by offering war maps, cheap fountain pens and other trinkets.

The Rural Press is above employing such methods. We have never used any inducements to get subscriptions except the merits of the paper, and we do not feel that a fair is the proper place to solicit subscriptions. People go there to be entertained and instructed. So while we are always represented at fairs, our men go to serve the people; not to impose upon them.

If you need information, advice or assistance of any nature, hunt up a man with a "Pacific Rural Press" badge on. No matter what your need may be, some one of our men will be an authority along that line and will be able to help you. You will find the scope of our service sufficiently broad to cover all of your requirements; you will find willing hands and fertile brains always at your command. And, too, you will find everything done with a warmth of feeling that will prove the deep personal interest we take in you. Remember, this service is absolutely free. Our representatives are not allowed to receive pay or gratuities of any kind. This is a part of the service to which your subscription entitles you. Don't hesitate to take advantage of it. The more we can serve you the better it will please us.

When the New Hogs Arrive

[Written for Pacific Rural Press.]

Expect to buy any hogs at the Liberty Fair? Perhaps you are thinking of getting a new herd boar, or a few choice bred sows. Fine! You can't have too much good stock. But it will remain good only as you treat it right, and it is important to give particular attention to hogs when they are first received.

Handle the crates carefully in loading and unloading them. Don't drive fast on the way home if the road is rough, especially if you have a bred sow. When you get the hogs home, take them out of the crates as soon as possible. The boards can easily be removed from the rear ends of the crates and the animals will back out. Give them all the clean, fresh water they want to drink, but feed them lightly at first. They are under abnormal conditions while traveling and probably have not eaten much. Consequently, they will overeat if given the opportunity, and they need to be fed sparingly until they are back to normal conditions. The temptation to overfeed a hog just received is so strong that it requires considerable nerve to limit its ration, but for the good of the animal this must be done. If possible, give about the same kind of feed that the hogs have been receiving. It is not necessary to keep them on such a ration right along, but abrupt changes upset digestion and cause disorders of many kinds, so it is best to change to a new ration gradually.

Watch the droppings and see that the bowels are kept in good condition by feeding laxative foods. If you do not have alfalfa or green pasturage, some sort of green feed should be supplied.

The hogs should have a comfortable place to sleep, and should be protected from summer sun and winter rain. They can stand cold much better than heat, and if you keep them cool in summer time you will eliminate much trouble. They should be allowed to take liberal exercise, and if they do not show a disposition to move around they should be driven slowly and quietly until they have had a fair amount of exercise.

A young boar should never be allowed to run with sows. It will interfere with his growth. Two boars may be kept together, provided their tusks have been removed, and this should always be done. Be careful about putting a bred sow in with a bunch of strange ones. They are sure to fight her, and, being several against one, they are liable to injure her or ruin the litter she is carrying and perhaps disable her.

If an animal seems stiff or lame when taken out of the crate, bathe its limbs in warm water and rub them thoroughly, using witchhazel or some mild liniment, if you have it, in order to bring back a good circulation of blood, which has been retarded by the confinement and cramped position of the hog while in transit.

The hogs may seem afraid of you at first, as you are a stranger to them. So be very kind and patient with them. Win their confidence and get them so that they will stand or roll over for you to scratch them. Under this kind of treatment they will soon become accustomed to their new surroundings and will do efficient work in their new home.

A Yerington (Nev.) correspondent writes the Rural Press that there is an abundance of hay and pasturage in Mason Valley, reports to the contrary notwithstanding.

More than 70 Registered

Holstein Cows

31 OF THEM WITH RECORDS FROM 20 TO 33 POUNDS BUTTER IN 7 DAYS, 30 OF THEM WITH YEARLY RECORDS UP TO OVER 24,000 POUNDS MILK AND OVER 1000 POUNDS BUTTER, BRED TO KING MEAD OF RIVERSIDE, PRINCE GELSCHE WALKER, SEGIS PONTIAC DE KOL BURKE, SIR AAGGIE DE KOL ACME, AND KING MORCO ALCARTRA, are only a part of the offering to be made at public auction by

A.W. Morris & Sons Corporation

WOODLAND, CALIFORNIA,

Thursday, November 12, 1918.

NO OTHER HERD IN THE WORLD COULD OFFER A HERD OF COWS BRED TO FIVE OF THEIR OWN HERD SIRES, EVERY ONE OF WHICH HAS SIRED A WORLD'S RECORD DAUGHTER OR HAS FOR A DAM A COW THAT MADE A WORLD'S RECORD.

There will be

THREE COWS with records from 30 to 33 pounds butter in seven days.
TWENTY-EIGHT COWS with records from 20 to 29.87 pounds butter in seven days.
THIRTY COWS with records up to over 24,000 pounds milk and over 1000 pounds butter in one year.
TWENTY-FIVE FRESH COWS, tremendous producers.
DAUGHTERS of Prince Gelsche Walker; Segis Pontiac De Kol Burke; De Kol Hengerveld Burke; Alcartra Polkadot Corrector; De Kol Burke; Ignaro De Kol; Juliana King of Riverside; Aaggie Cornucopia Johanna Lad; King Mead of Riverside; Aralia King; Buffalo Skylark Ames; Colantha Sir Pontiac Aaggie; De Kol Spofford Promise; Woodcroft Pontiac Korndyke; Tilly Alcartra Son; King Pontiac Ruby Burke; and other noted sires.

Every animal sold is positively guaranteed to be a breeder.

No animal in this sale is tuberculin tested.

Some very highly bred and high record cows in this sale are along in years, and a few have blemished udders, but they are vigorous breeding cows and great producers, besides being bred to world famous bulls. It will be a rare opportunity to secure this blood at prices far inside their real value.

MORAL-BUY HOLSTEINS NOW

A Wisconsin soldier in France wrote to Hoard's Dairyman: "Before I left home, I heard farmers say: 'Oh, I'm going to sell my herd—feed is too high and my income too small, etc.' If these same farmers could only look ahead and realize what their herd is going to be worth as soon as we knock the war ideas out of Kaiser Bill, they would change their tune and would scratch and pinch to increase the herd. There is going to be an unheard of demand for **GOOD** cows and the fellow who is far-sighted enough to raise calves now is going to reap his harvest as soon as peace is declared." There is not a question of doubt that every man who owns good dairy cows will profit by holding onto them right now, and buying more good ones up to the uttermost limit of his capacity.

And while he is buying it is a heap more satisfactory and profitable to buy registered Holsteins.

There is an extra good herd of registered Holstein heifers, 49 of them, sired by two splendidly bred bulls and out of choice cows, in the herd of W. H. Ginn & Son, which we will disperse at public auction on their farm, one and a half miles southwest of Corcoran, California, on Thursday, October 10. Besides this great heifer herd, there are many choice cows, many of them either fresh or heavy springers, and some good young bulls just right for dairy herds.

The sale will start promptly at 9:30 a. m., as there are over 90 head to sell, with Col. Ben A. Rhoades of Los Angeles on the block.

All's Fair in War

(Continued from first page.)

rect from Washington, will occupy an entire building and will be worth traveling many miles to see. It will include the Browning machine gun, many war exhibits, a complete food exhibit, methods for food conservation, and many other things to bring the war home to us clearly and comprehensively, and to emphasize the colossal scale on which the nation has mobilized its productive forces to bring a speedy victory.

LIVESTOCK SHOW THE CHIEF FEATURE.

The Livestock Show will be broad in scope and will include a greater variety of blooded stock than has ever before been seen in the West. Cash prizes totaling $35,500 and valuable ribbon awards have brought out the best that California produces in cattle, horses, swine, sheep and goats. Nearly all classes will be larger than at the recent State Fair. The exhibits of cattle and hogs will be particularly strong, and the biggest goat show that the world has ever seen will be staged. One of the largest breeders of milch goats plans to equip a model goat dairy, milk his goats on the grounds, cool the milk and sell it as a beverage.

Fourteen new barns, each 144x32 feet, have been built for the accommodation of the blooded stock. In addition to these barns, each of which has thirty-two pens, there are five cattle pens for car lot entries, and six hog and sheep pens for the same class of entries.

In other columns mention will be made of the breeders who will show, and it will be seen that the leading herds of the State will be represented. The best judges in the United States have been secured, and Mr. Thomas, manager of the Livestock Department, has left nothing undone to make the Livestock Show the leading feature of the fair, and an event that will prove of practical value to all who attend as either exhibitors or spectators.

REASON FOR A CIRCUIT OF FAIRS.

For the first time in the history of California we have a circuit of fairs. The State Fair has already been held, and the Liberty Fair will be followed by the International Livestock Show at San Francisco. Perhaps you wonder why in these abnormal times, we should have more fairs than ever—why "all's fair in war."

Early in the year there were many who loudly advocated the abolishing of the show ring for the period of the war, as a measure for conserving livestock feeds. The motive back of these suggestions was most laudable, but the judgment which prompted them was not broad enough, in that it failed to measure the cost by the results.

The world faces a livestock famine of such magnitude that the average person cannot comprehend it. But there is a silver lining to the cloud, and it is the spirit of the American farmer himself. Once he realizes that he stands between the world and famine, he will get busy and do his part to relieve the situation.

But he will not realize this while he remains at home. He must get away from the humdrum of his daily work and into an atmosphere of inspiration and achievement. And what better place for his enthusiasm to be aroused than at the war-time fair? The true conditions across the water are impressed upon him, and he is shown the part that he must play in meeting the demands of the hour.

He goes home determined to do everything in his power to help furnish food for the allies and our boys. He starts out well, but alas, he is human. His interest begins to wane; he begins to lose his enthusiasm. But just at that time there is another fair. He attends, and receives new inspiration. So he keeps up the good work which otherwise would have been forsaken, if not forgotten.

IN A CLASS BY ITSELF.

This is only one of many good reasons for holding the Liberty Fair. It is in a different part of the State; there will be different attractions and quite a different attendance. Different crops, fruits and flowers will be shown. Many herds of livestock that were not at the State Fair will be shown, and even those that meet again will compete under different judges. The grounds, the buildings, the exhibits, the weather—everything will be so different that no one should feel justified in staying home because he attended the State Fair.

The heavy work of the season is over. You need a change and a rest. You need to get new inspiration and to learn improved methods for your work. Don't say that you can't get away just now, or that the trip will cost too much. No matter what the sacrifice of time or money, you will be repaid a hundred times over. Take the folks along. You'll all learn something. You'll all enjoy it.

SOUTHERN CALIFORNIA FAIR AT RIVERSIDE.

Elaborate preparations have been made for the Southern California Fair, to be held at Riverside, October 8 to 12, and from all sections south of the Tehachapi will come livestock and products of the soil. Even old Mexico and Lower California will be represented with large showings.

True patriotism will ring out in every nook and corner of the grounds from beginning to end, and a patriotic program of intense interest has been prepared. The U. S. Government will have a large and instructive exhibit to show the departments actively engaged in strafing the Hun.

There will be excellent amusement features, and everyone who attends will derive both pleasure and profit.

Poland-China Plans for Liberty Fair

[Written for Pacific Rural Press.]

Last week we mentioned the new and novel plans originated by the Berkshire breeders, but the Poland-China people don't purpose to take a back seat for anybody, and they have put salt on the tails of some mighty clever ideas themselves.

At their annual meeting held at the State Fair they created the office of show manager and elected W. A. Young of Lodi to fill the position. His duties will be to see that all pens occupied by Poland-Chinas at the different fairs are attractively decorated. The other breeders will assist him in putting up the decorations and the cost of bunting and other materials used will be prorated among the exhibitors, according to the number of pens used.

The association decided to ask the State Fair authorities for a rotation system of assigning pens to the different breeds; for scales and the official weighing of all hogs; and for washing pens.

They voted to ask the authorities at all shows to have the judges explain, after judging each class, their reasons for placing the awards.

There promises to be a big showing of Poland-Chinas at the Liberty Fair. A few of the exhibitors at the State Fair felt that the judge cared too much for size and not enough for quality. They will show under a different judge at Los Angeles, and the results will be watched with great interest.

Modesto Holstein Sale

[Written for Pacific Rural Press.]

"I wish I had started with pure-bred Holsteins," is the lamentable expression of many dairymen who have been maintaining grade herds for years. Perhaps their cows are doing well, so far as production is concerned, but naturally the owners want to make as much money as possible, and they realize that, no matter how much they may breed up, no matter how fine the young stock may come, the surplus can never be sold at high prices. They realize that, had the same amount of care and attention been given a registered herd of half or quarter the size, the returns would be infinitely greater.

A splendid offering of 80 registered Holsteins is announced for the second annual sale to be held at Modesto, Thursday, October 17. Choice young cows, heifers and bulls will be consigned from some of the leading herds of the State, and the entire herd of C. G. Outland will be dispersed. There will be show cows, high record cows, heifers bred to great bulls, and young stock from high record ancestry. There will be several bulls of type and breeding entitling them to places at the head of the very best herds.

Every animal will be tuberculin tested and sold subject to retest, and will be guaranteed a breeder by the California Breeders Sales and Pedigree Company, which has charge of the sale. Both Col. Ben A. Rhoades of Los Angeles and Col Cy N. Clark of Modesto will be found in the box.

J. B. & J. E. Thorp of Lockeford, who have been capturing so many ribbons at the fairs this fall, will show 14 head of Jersey cattle and a good bunch of Duroc hogs.

Meet these Breeders at the Liberty Fair

[Written for Pacific Rural Press.]

H. P. Slocum & Sons, Willows, who have been gathering in ribbons by the basketful this fall, will show a classy lot of Durocs.

Ireland Ranch, Owensmouth, will show a futurity litter of Durocs that is a hummer. The pigs are by Great Model and average 240 pounds at six months.

W. J. Higdon, Tulare, who has one of the finest herds of Holsteins in the State, will be there with some mighty choice ones, fitted to the queen's taste.

Roy Dawson of Gardena will be there with six Hampshire hogs that will be hard to beat. Mr. Dawson is a constructive breeder and has some great stock.

M. Bassett & Son, Hanford, will show Poland-Chinas in almost all classes. When it comes to easy-feeding qualities and finish the Bassett hogs certainly take the cake.

John M. Bernstein, Hanford, owner of the famous Poland-China boar, President, will be there with a lot of good ones, and as usual may be expected to win his share of the ribbons.

J. A. Bunting of Mission San Jose will be there with his great string of Herefords that made such a wonderful record at the State Fair. He'll show these Eastern exhibitors a thing or two.

T. T. Miller of Los Angeles, whose famous Shorthorns were missed at the State Fair, has entered them at Los Angeles and will furnish lively competition. Mr. Miller has some of the best in the West.

J. E. Wherrell, the Jersey breeder of Riverside, who did so well this year at the State Fair in the classes for young stock, will show about 10 head—mostly in the calf classes. He has some toppy youngsters.

F. L. Hall, Perris, will make a good showing of his classy Berkshires. They are noted for their bone, stretch, strong backs and good feet, and will be able to hold their own in the hottest competition.

C. J. Gilbert of the Poplar Ranch, Lancaster, has caught the Liberty Fair spirit and will send down a herd of Hampshires of real quality. Mr. Gilbert is developing a corking good herd of this popular breed.

Carruthers Farms, Live Oak, will make a showing of Shorthorns and Berkshires that will be hard to beat and will consign their entire State Fair show herd of Berkshires to the Western Berkshire Congress sale.

James Marwick of Mesa Sarita Ranch, Santa Barbara, has entered his Percheron stallion, Major, three mares, a filly yearling and a stallion colt. All of these are prize winners or from prize-winning stock.

Bridgford Company, Knightsen, will show a full string of Holsteins that promises to be the best combination they have ever taken out, and they hope to duplicate their wonderful winnings at the State Fair.

Fred Hartsook, Lankershim, will show the $4,000 aged prize herd of Poland-Chinas, recently purchased from H. I. Marsh of Modesto; also some corking good young gilts. Mr. Marsh will show a herd of young stock.

Llano Vista Ranch, Perris, are willing to bet their last dollar on the Hampshire hogs they will show. This concern certainly has some great stock that will play an important part in the Hampshire history that is being made in this State.

L. A. Denker of Saugus will show not only all of his Hampshire swine that won so many championships and other prizes at the State Fair, but also an 80-head car lot of fat barrows that will be well worth staking a good-sized wager on. They surely are pippins, as are all of his hogs.

Conejo Ranch, Newbury Park, will show the same herds of Duroc and Hampshire hogs that enabled them to win 60 ribbons with 60 animals at the State Fair, including several championships and grand championships. Also a carload of fat barrows will be entered. Watch for a big clean-up here.

University Farm will compete for prizes this time. They will show their four-horse team of Percheron mares, a full line of sheep, a steer that will make typical army beef, some typical army market barrows, and the world's record goat, California Gretel. The exhibit will occupy a section by itself.

Donald H. Graham, the Duroc breeder of Lancaster, will take along three boars, five sows, three fat barrows and a carload of fat hogs. Mr. Graham hasn't made much noise so far, but he has some of the best stock in the State, and he is going to make some of the older breeders hustle to retain their laurels.

John E. Marble of South Pasadena, the leading Dorset Horn breeder of the West, will show eight or nine head, including the champion ram at the State Fair, and a coming yearling ram that he thinks is even better; also an ewe that he believes can win over his champion ewe. Mr. Marble has grand stock and it is always in the pink of condition.

McAlister & Sons of Chino, who were missed at the State Fair this year, will try to win enough ribbons at Los Angeles for both shows. They have entered 16 head—an aged bull, six aged cows, and the balance young stuff. The latter will include several sons and daughters of their famous herd sire, "It." They have wonderful type and prove the breeding ability of this great bull.

A. B. Humphrey of Escalon will take along a big grip that he expects to fill with ribbons won by his Guernsey cattle and Berkshire hogs. The quality of the Grapewild

HEAD YOUR FARM FLOCK WITH A

Registered

DORSET RAM

Dorset rams cross well with range ewes. Many growers of early lambs prefer **Dorset** grades, from the **Merino** cross, to any other ewe, purebreds not excepted. These grade ewes are **great milkers** and hardier than purebreds, and more desirable for mutton makers. When mated to purebred Dorset rams, they produce a **very blocky, easily-fattened** lamb.

JOHN BRIMS (Shepherd), Box 432 REDLANDS, CAL.

THE SHEEP THAT BRING THE BIG PRICES

Are the Kind to Buy

Rambouillets

I purchased at the Salt Lake sale 31 head of the best (Butterfield, Quealy and Bullard strains) to head my breeding ewes. I have about 100 big, smooth, heavy-wooled rams for sale.

J. BIDEGARAY, - FRESNO, CAL.

THE BULLARD TYPE

Rambouillet Sheep

Again Awarded All Prizes at the 1918 State Fair

A Bullard Yearling Ram that sold for $1000 at the Salt Lake Ram Sale.

A pen of Bullard Range Rams brought the highest price ever paid in America.

We purchased a ram for $3,000 conceded by Prof. Coffey to be the best Rambouillet in the United States, for use in our flocks.

The Bullard kind are the kind to own. They produce wool and mutton at the lowest cost.

Single Animals or Carload Lots.

BULLARD BROS. **Woodland, Cal.**

FINE WOOL HEAVY LAMBS

Big, smooth-bodied, heavy wooled Rambouillets of the best breeding. I have used only registered rams on my original foundation of purebred ewes and their offspring. A few choice yearling rams for sale. Write for their breeding or come and see them.

E. C. SPEAR, St. Helena

stock is known the country over, and represents years of careful breeding. Mr. Humphrey will make the other fellows hump at Los Angeles. Also he will consign five extra good sows to the Berkshire sale.

Lack of space prevents us from making detailed mention of all of the herds that will be shown, but it is expected that all of the following will make good exhibits:

Jersey cattle: D. F. Conant, Modesto; C. D. Hayworth, Modesto; N. H. Locke, Lockeford; Guy H. Miller, Modesto.

Guernsey cattle: Calla Grove Farm, Manteca; A. B. Humphrey, Escalon; L. D. Smith, Berkeley.

Ayrshire cattle: E. B. McFarland, San Mateo; J. Henry Meyer, Watsonville; Preston School, Waterman.

Dutch Belted cattle: U. G. Strader and Mrs. Jennie Strader, Ceres.

Shorthorn cattle: C. N. Hawkins, Hollister; Anderson & Kellogg, Suisun; Frank Brown, Carlton, Oregon; Miller-Maxwell Company, Colorado; Dibblee Estate, Santa Barbara; Roselawn Stock Farm, Woodland.

Hereford cattle: University of Nevada; Dean Duke, Likely; Cazier Bros., Wells, Nevada; Wyoming Corporation, Denver; W. H. Curtis, Calgary, Alberta; Scharueler & Holmes, Phoenix, Arizona.

Aberdeen-Angus cattle: Congdon & Battles, North Yakima, Wash.

Berkshire swine: Homer Hewins, Calistoga; Elizabeth M. Holje, Calistoga; A. B. Humphreys, Escalon; Jas. Wilson, Jr., Yerington, Nev.

Poland-China swine: W. L. Haag & Son, Hanford; J. H. Cook, Paradise; Chas. Gatewood & Son, Fresno.

Chester White swine: Highland Stock Farm, Fair Oaks; Mrs. L. M. Yore, East Auburn.

Draft horses: Ruby & Bowers, Davis; E. M. Simpson, Hood.

LIVESTOCK DIRECTORY.

SWINE

Poland-Chinas.

I AM IN CLASS 1 IN THE DRAFT, so will sell my 26 head of registered Poland-China hogs. They are of the best blood lines and breeding obtainable, such as the Giantess strain, the Big Jumbo, Big Timm, Big Bone, Young Jumbo, President and Longfellow strains. Will sell entire herd, including one herd boar, several young boars, brood sows and gilts. All are A1 animals. Prices reasonable; satisfaction guaranteed; pedigrees promptly furnished. Howard C. Peterson, Box 396, Reedley, Cal.

Poultry for Profit

By Susan Swaysgood, Pomona.

A PATRIOTIC DUTY OF FARMER AND SUBURBANITE.

The San Francisco Livestock and Poultry Show in the north follows on the heels of our Los Angeles Liberty Fair. Every farmer and suburbanite within traveling distance of these two fairs ought to visit them and get interested in his or her special kind of livestock. It does not much matter what it is, so that you are interested in keeping up the supply of meat. Vegetarians, fruitarians and all non-meat eaters soon lose their fighting qualities, so it won't pay to lose interest in the meat business. Poultry and rabbits can be made to produce more meat in a given time than any other animal.

RABBITS A DIFFICULT PROPOSITION.

Rabbits are a rather difficult proposition in some people's hands, while others seem to have fair success with them. The demand is good and at good prices, but hay in this section is so high that those who have rabbits tell me the profits are small when the hay must be purchased.

With poultry, where hens can be turned out to rustle a part of their living, the profits are much more. There is more chance, too, of using up rough stuff with chickens. If it does not do raw, it can be cooked and utilized; whereas rabbits must have clean raw food that is about perfect, or they soon get diseased. Dusty or moldy feed is almost instant death to rabbits. It is not good for poultry, but if they are not kept hungry, as a rule they eat it carefully and do not swallow the dust. Moldy feed will, however, cause canker trouble and get into the digestive tract with the bacteria. If it is cooked, however, no danger need be feared. Mangels, raw beets of any kind, turnips or small potatoes all help to feed the poultry, and they are better fed raw than cooked.

DON'T OVERFEED COOKED POTATOES.

Too many cooked potatoes cause hens to lose the use of their legs and sag down behind. This is because the potatoes are so starchy. When this occurs, cut down on potatoes. Small, defective apples, if sweet, may be allowed, but these, too, should be raw and optional with the hens. It is not the feed that causes any particular trouble but feeding too much of one thing, thus forcing the hens to eat that or starve. If hens are allowed to run in an apple orchard, provided they have other feed, they will not eat enough to affect their laying; but if given no other feed, such as grain or mash, they will fill up on apples and exist, even make flesh, if the apples are sweet—but you won't get many eggs. The same thing occurs with grapes. Sweet grapes, with plenty of other feed, serves as a succulent green, but sour grapes will stop egg production if they eat many of them. My experience has been that when hens are properly fed they will not eat enough of anything harmful to do mischief.

INSECT PESTS.

To the Editor: Our chickens have some kind of insect on them, and there are so many of them that it simply kills them. What shall I do?—Miss V. A., Fowler, Cal.

[There are but two kinds of insects that kill chickens. Mites are little red fellows that look as big as a flea and leave the chickens at daybreak, going into cracks in the woodwork or under the perches during daytime. Sometimes they stay on chickens in the daytime. Spray the house three or four times with distillate or some strong commercial spray. The best is made with one quart crude carbolic acid to one gallon distillate. Mix and saturate wall, ceiling and perches. Three days later go over it again, and do same three days later. Then spray once a week. The other insect is the tick, and it works in a similar manner. The same treatment will apply to the house. In addition, you might touch the ticks with coal oil and turpentine very lightly. If you put much on you will kill the chickens.]

SEPTEMBER CHICKS — CANKER.

To the Editor: When will chicks hatched in September commence to lay in this latitude? Will they molt next year? A few of my hens have canker. If the head of a hen having canker is cut from the body, would there be danger of contagion in feeding the body to fowls provided the same was well boiled?—H. H., Sebastopol.

[September hatched chicks will commence to lay not later than February, if given decent care. Burnt alum powdered and rubbed in canker sores will sometimes cure, but not always; in fact, some cases do not respond to any treatment, but swabbing the places with raw creolin is a good remedy. Do it three or four days in succession. If the head is burned it makes it safer for the rest, and boiling will certainly kill all germs, so that you may feed the carcass to the rest.]

RABBITS HAVE SORE EARS.

To the Editor: Will you please tell me what I can do for rabbits which have sore ears? Are they incurable? Is it contagious?—J. A. C., Fairoaks.

[Sore ears can be cured as can other sores, but you must prevent the cause, which is lack of cleanliness. Be particular in keeping the hutches dry and clean. Mix equal parts of flour of sulphur with vaseline, wash the sores in warm water and soap, then dry on a soft cloth and apply the sulphur ointment freely. Do this several times and keep clean, and you will get rid of the sores and the cause.]

TURKEYS HAVE CHICKEN POX.

To the Editor: My turkeys have peculiar lumps all over their heads, resembling a scab. What can I do for them?—G. L. W. C., Tulare.

[This is chicken pox. Keep them away from children. Rub carbolized vaseline all over the heads and neck, rub in well, then wipe off the superfluous vaseline. Give a little castor oil in a little warm mash at night just once and they will get over it. But mind, it is contagious.]

RABBIT BOOK WANTED.

To the Editor: Would you kindly advise me as to where I could get an authentic book on raising rabbits?—D. T., Hanford.

[American Breeders' Review Company, 132 Nassau street, Department 69, New York, publishes such a book.]

Poultry Breeders' Directory

Dollar-Making Facts For Poultry Keepers

What is Pratts Poultry Regulator?

A positive tonic and conditioner for poultry of all kinds and ages. *A health-builder and health-preserver.* Not a food.

What does it contain?

Roots, herbs, spices, mineral substances, etc. Each ingredient performs a certain duty. The combination spells "health insurance."

What does it do?

Pratts Poultry Regulator makes and keeps poultry healthy, vigorous and productive. It shortens the molt, sharpens the appetite, improves digestion and circulation, hastens growth and increases egg-production. *It saves feed* by preventing waste due to poor digestion. *It prevents disease* by keeping the birds in condition to resist the common ailments.

Has it been fully tested?

Yes! In general use for nearly fifty years. The *original* poultry conditioner. Imitated, but unequalled

Does it give general satisfaction?

Positively! *Satisfaction guaranteed or money refunded.* Test it at our risk. Increased egg-production will prove that "Pratts makes hens lay."

How is it best used?

Daily in small quantities. For adults, a tablespoonful daily for 10 birds. Younger stock in proportion. Mix with dry or moist mash.

What does it cost?

Nothing, because *it pays big profits.* One cent a month per hen is the *investment* required.

Where can I get it?

From 60,000 Pratt dealers. There is one near you. Direct from the manufacturer, prepaid, if your dealer can't supply you.

How can I learn more about it?

Ask the Pratt Food Co., Philadelphia, for valuable FREE BOOKS on poultry keeping. Write today!

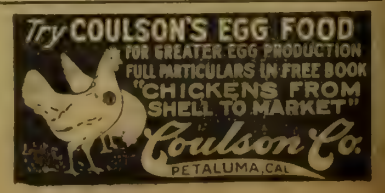
Why Hens Won't Lay

P. J. Kelly, the Minnesota Poultry Expert, 88 Kelly Bldg., Minneapolis, Minn., has published a book, "The Tale of a Lazy Hen." It tells why the hens won't lay and how to make them lay every day. Mr. Kelly will mail the book free to anyone who will write him.



HOME CIRCLE

THE GULF STREAM.

There's a brown stream that is flowing through the blue Atlantic waters;
There's a warm stream that is crossing from the new world to the old.
And the way of it is silent in a broad, majestic passage,
And its mighty course is hidden from the eyes that would behold.

Deep the springs are that have fed it, from the centuries upwelling,
From the pioneers who labored that the nation should be free,
From the prophets and the martyrs, from the soldiers and the mothers.
And the host of them that perished for the sake of liberty.

So the brown stream cleaves the ocean to effect a transformation,
That the world shall be delivered from the icy bounds of death;
And within the stricken countries joy shall be again upspringing,
And the lands once more shall blossom in the fervor of its breadth.

—McLandburgs Wilson in New York Sun.

SEVEN REASONS FOR SAVING.

1. Save for your country's sake, because it is now spending millions a day and must find most of the money out of savings.

2. Save for your own sake, because work and wages are plentiful, and, as prices are high now, a dollar will buy more after the war.

3. Save, because when you spend you make other people work for you, and the work of everyone is needed now to win the war.

4. Save, because by saving you make things cheaper for everyone, especially for those who are poorer than you.

5. Save, because by going without you relieve the strain on ships, docks, and railways, and make transportation cheaper and quicker.

6. Save, because by saving you set an example that makes it easier for the next man to save. A saving nation is an earning nation.

7. Save, because every time you save you help twice, first when you don't spend and again when you lend to the nation.—The Commonwealth.

THE SUGAR SITUATION.

The U. S. Food Administration has sent out a bulletin on the sugar situation, including facts concerning sugar production, reserve stocks, geographical problems, prospects for the next crop and the shipping situation. The object of this is to supply definite information supporting the necessity for sugar conservation. While there is a world sugar shortage, there is no sugar famine nor likelihood of one.

Compliance with the present voluntary ration of two pounds a month per person will take care of the situation for a seemingly indefinite time, without the need for further reduction in amount.

A CAKE WHICH BREAKS NO RULES.

Nowadays we are all looking for recipes for cakes which we can make without breaking any of the conservation rules. Here is one which a good cook has worked out and found good: ¾ cup corn syrup, ¼ cup sugar, 2 eggs, 1 tablespoon substitute fat, ½ cup milk, 1 teaspoon soda dissolved in a little water and stirred into sugar and corn syrup, ½ cup raisins, well flavored, enough flour and oatmeal combined to make a thin batter (may be used half and half), spice may be added. Bake in well-floured muffin tins.

SPARKLETS.

People have curious ideas as to the treatment patients receive in asylums. A nurse on a visiting-room duty recently heard a newcomer asking as to the treatment of patients. "Oh," was one reply, "they treats poor things cruel here. They gives 'em a bath every week."

An old lady traveling for the first time in a large city saw a glaring sign on the front of a high building, which read, "The Smith Manufacturing Company." As she repeated it aloud slowly, she remarked to her nephew: "Lawsey mercy! Well, I've heard tell of smiths all my life, but I never knew before where they made 'em."

Mrs. Reginald DeKoven said of a certain piece of cruelty: "It reminds me of the action of a Chicago girl. 'Why have you thrown over Mr. Smith?' a friend said to this girl, reproachfully. 'Oh,' she replied, 'I could never marry a man with a crooked leg.' 'What made his leg crooked?' 'I ran over it with my motor car.'"

A colored Baptist was exhorting. "Now, breddern and sistern, come up to de altar an' have yo' sins washed away."

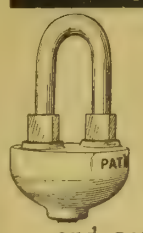
"I done had my sins washed away."

"Yo' has? Where yo' had yo' sins washed away?"

"Ober at the Methodist church."

"Ah, brudder Jones, yo' ain't been washed; yo' jes' been dry cleaned."

A traveling man, the story goes, one night found himself obliged to remain in a small town on account of a washout on the railroad. The rain was still coming down in torrents. The traveling man turned to the waitress. "This certainly looks like the Flood." "The what?" "The Flood. You've read about the Flood, and the ark landing on Mount Ararat, surely." "My, mister, I ain't seen a paper for three days."



Liberty Bonds AND Fuel Thrift Patriotism and Comfort

The thrift that is possible from the successful use of coal oil in the making of fuel gas was first demonstrated three years ago when the discovery of simplicity and perfection in the Premier Burner was offered the public.

Had it been planned as a war-time thrift measure, it could not have been introduced at a more important time, when every effort toward economy is of necessity adopted.

Full information in circular "B" mailed upon request. Ask all the questions you want to, you will receive prompt reply.

THE MARKET REPORTS

Figures Given are Independent and Reliable.
Prices Quoted as Paid to Producers.

SAN FRANCISCO

San Francisco, October 2, 1918.

WHEAT.

Wheat is selling at the prices announced by the Federal Grain Corporation, and these prices will doubtless be maintained for the present crop. The prices quoted are for grain f. o. b. San Francisco, Los Angeles, Seattle, Tacoma and Portland, and guaranteed at least $2 per bushel f. o. b. shipping point. The price of sacks and sacking not included.

No. 1 hard $2.20
No. 2 ...... 2.17
No. 3 ...... 2.13
No. 1 soft 2.18
No. 2 ...... 2.15
No. 3 ...... 2.11
Club or Sonora, No. 1 ...... 2.16
do, No. 2 ...... 2.13
do, No. 2 ...... 2.09

BARLEY.

How the surplus barley crop is to be disposed of, with the brewers out of the market, is puzzling the trade. Barley is weak, with no disposition on the part of the seller as yet to cut the price or on the part of the buyer to pay the price demanded.

Choice feed, per ctl ...... $2.15@2.20

OATS.

There has been some inquiry for seed oats, but little demand. Buyers feel that if barley becomes materially lower it will carry down the price of oats and they are waiting on a more definite barley market before buying freely of oats.

Red feed, per ctl ...... $2.50@2.55
Red seed ...... 2.90@3.10

CORN.

Corn continues nominal, with little demand and small available stocks.

(First-hand prices on strictly first-class grain, San Francisco.)

California sacked ...... $4.20@4.25
Milo maize ...... 3.95@4.05
Egyptian ...... 4.05@4.10

HAY.

Receipts of hay for the past week were 934 tons, compared to 670 the previous week. A good part of this week's receipts was damaged by the rain. Some sales of damaged hay have been reported as low as $7.50 per ton, track basis. Other hay that showed but slight damage was sold at $15 and $16 per ton. More hay was damaged by the rain than was at first anticipated.

Wheat No. 1 ...... $23.00@25.00
do, No. 2 ...... 20.00@22.00
Choice tame oat ...... 24.00@26.00
Wild oat, new ...... 19.00@23.00
Barley, new ...... 19.00@23.00
Alfalfa, first cutting ...... 16.00@20.00
do, second cutting ...... 22.00@24.00
Stock ...... 18.00@21.00
Barley straw ...... 50@80c

FEEDSTUFFS.

On account of the rain, the grinding of new alfalfa meal has come to an end for the present and the meal is consequently quoted at an advance over last week's quotations. Rolled barley is lower on account of the weak barley market.

New alfalfa meal, per ton ...... $34.00@35.00
Coconut cake or meal 45.50
Cracked corn ...... 86.00@88.00
Oilcake 78.00
Rolled barley ...... 47.00@48.00
Rolled oats ...... 57.00@58.00
Bran, carload lots in S. F. 23.75
Mixed feed, do, do 25.00
Middlings, do, do 25.75

POTATOES, ONIONS, ETC.

Both potatoes and onions are easier this week on account of the good supply coming into San Francisco. There were very few peas on the market today. Beans are still plentiful.

Peas ...... Nominal
String beans ...... 5@8c
Garden beans ...... 7@8c
Wax beans, per lb ...... 6@7c
Carrots, per sack ...... 85c@$1.00
Rhubarb, San Jose, per box ...... $1.00@1.25
Summer squash ...... 75c@$1.00
Pumpkins $1.00
Cucumbers (hothouse), per box ...... None
do Alameda, lugs ...... 60@75c
Eggplant, per box ...... 75c@$1.00

Merced ...... Nominal
Bay ...... $1.25@1.50
Potatoes—
Garnet Chile, on street ...... None
Whites ...... $2.00@2.25
Sweets, per sack ...... 3.75@4.00
Onions—
River Reds ...... None
Yellows ...... $1.15@1.40
Australian Browns ...... 1.15@1.40
Garlic, new ...... 13@15c
Green corn, Alameda, per sack ...... Nominal
Okra ...... 5@7c

BEANS.

The cool, cloudy weather, with occasional showers, is keeping back the new crop of beans. If the present weather continues, a considerable quantity of the new crop will not dry out in a condition fit for the market. This possibility of loss and the fact that the new crop is late in coming into the market had a strengthening effect on the market for old beans.

Bayos, per ctl ...... $ 7.50@ 7.75
Blackeyes ...... 6.75@ 7.00
Cranberry beans ...... 10.25@10.50
Limas (south recleaned) ...... 11.70@11.90
Pinks ...... 7.40@ 7.60
Red kidneys ...... Nominal
Mexican Reds ...... 7.25@ 7.40
Tepary beans ...... 7.50@ 8.50
Garbanzos ...... 8.00@ 8.75

POULTRY.

Receipts of poultry include one carload from the East. Fryers, hens and young roosters were weaker on a falling demand.

Turkeys, live, young spring, lb ...... 36@37c
do, old ...... 32@33c
do, dressed, old ...... 34@38c
Broilers, 1½ to 2 lbs ...... 39@42c

Fryers 35c
Hens, extra, per lb., colored 34c
do, Leghorn ...... 30@31c
Smooth young roosters, per lb. (3 lbs. and over) 35c
Old roosters, colored, per lb 24c
Geese, young, per lb ...... 27@28c
do, old, per lb 25c
Squabs, per lb ...... 50@52c
Ducks ...... 29@30c
do, old ...... 25@27c

BUTTER.

Butter is scarce in this market. On several days during the week there were not enough received to permit of any being offered on the Exchange. Considerable butter is coming out of storage and a serious shortage this winter is predicted. Compared with the prices of a year ago, butter is very high. During September of this year the high price of butter was 65c and the low 56c for extra, and 56c and 50½c for prime firsts. In September of 1917 these prices ranged 46c and 40c for extra and 44½c and 40c for prime firsts. An 8 per cent commission should be taken from this year's prices to make the comparison on last year's basis.

The new scale of commissions on butter was misplaced last week. Following is the butter scale of commissions:

Market Price—	Discount
Up to 46½	8 per cent
From 47 to 50	7½ "
50½ to 53½	7 "
54 to 57½	6½ "
58 to 62½	6 "
63 to 68	5½ "
68 to 75	5 "
75½ to 83	4½ "
83½ to 93½	4 "

This week's fluctuations are as follows:

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extra	61½	65	65	65	65	67
Prime 1st	56	56	56	56	56	Nom.
Firsts	56	56	56	56	56	Nom.

EGGS.

Extra eggs continue strong and higher, while extra pullets show a half cent advance for the week. During September eggs fluctuated from 58c to 65½c for extras and from 51½c to 62c for extra pullets. These figures, with 8 per cent discount, may be compared with those of September, 1917, which were respectively 45c and 49½c for extras and 41c and 46c for the pullets, or a range of from 7c to 12c higher this year than last.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed
Extras	64½	65	65½	65½	66	66
Extra 1sts			Nominal			
Firsts			Nominal			
Extra pullets	55	55	55½	56	55½	56

CHEESE.

Oregon triplets showed an advance of 1½c on the local market. A comparison of September prices for cheese with those of last year's September show that cheese is selling from 5c to 7c higher on the Exchange this year.

California Cheddar, flats, fancy 30½c
Fancy California flats, per lb 30c
First California flats, per lb 28c
California Y. A. fancy 31c
Oregon triplets, fancy 34c
Oregon Y. A. fancy 30½c
Monterey cheese ...... 24@27c

FRESH FRUITS.

There are still some peaches, plums and cantaloupes on the market, but they are about at the end of their season. The berry market continues in good shape.

Apples ...... $1.50@2.50
Peaches, 4-box crate ...... 75@1.25
Figs, black, per box ...... None
do, double layer ...... 75c@$1.00
do, Single Row Whites ...... 75c@$1.00
Strawberries, per chest ...... $7.00@10.00
Blackberries, per chest ...... $8.00@10.00
Raspberries, per chest ...... $8.00@10.00
Plums ...... $1.00@1.50
Cantaloupes, flats ...... None
do, ponies ...... $1.00@1.25
do, standard ...... 1.25@1.50
Watermelons, per lb ...... 1¼@1½c
Pears, Bartlett, per box ...... $1.50@2.50

do, Malaga ...... $1.00@1.25
do, Fontainbleu ...... None
do, Tokay ...... $1.00@1.25
do, Isabella ...... 1.00@1.25
Persimmons ...... 1.00@1.50
Alligator Pears ...... 3.00@3.50

CITRUS FRUITS.

Oranges and grapefruits are strong at unchanged quotations, while lemons continue weak. Five dollars is now the top for fancy lemons.

Oranges ...... $7.50@8.50
Lemons, fancy ...... 4.00@5.00
do, choice ...... 3.50@4.00
do, standard ...... 3.00@3.50
Grapefruit ...... 5.50@7.00

DRIED FRUITS.

It was officially announced this afternoon that the Government has commandeered the entire prune crop of California on account of the serious losses arising out of the recent rains. The prunes which are thus taken over from the 30-40 to the 90-100 inclusive, and the order means there will be none for the civilian population. Rains have done great damage to the raisin crop, according to the latest information, but there is no intimation that this crop or a portion of it may be taken over. All quotations on figs have been with drawn by the buyers on account of the damage to the crop by the rains. Apples and pears are very strong and the buyers are now paying the dryers 14½ for apples and from 11 to 14 for pears.

Apples ...... 13@14c
Pears ...... 11@14c
Prunes, graded, price to growers:

RICE.

Stocks of clean rice in the hands of the trade, jobbers, wholesalers, and retailers, were never lower than at present, and eager buying is expected as soon as the new crop is ready. Harvesting of rough rice will not begin before October 5, and the first sale of paddy, scheduled for October 12, may be delayed.

Paddy rice, 1918 crop $4.32
Clear No. 1, 1918 crop at mill 7.00

HONEY.

The honey situation shows no changes this week.

LOS ANGELES

Los Angeles, Oct 1, 1918.

BUTTER.

Receipts continue light and consumption keeps up well in the face of the high prices. Arrivals for the week were 250,000 pounds against 311,900 pounds the same week last year. There was withdrawn from cold storage during the week, 70,680 pounds against 41,902 pounds the same week last year.

We quote:

California extra creamery 58c
do, prime first 56c
do, first 55c

Daily quotations:

1918—	Tu	Wed.	Thu	Fri	Sat.	Mon.
Extra	58	58	58	58	58	58
1917—						
Extra	45½	45½	45½	46	46	46

EGGS.

Receipts of fresh ranch eggs show a falling off. Arrivals by rail for the week were 525 cases against 598 cases the same week last year. Truck receipts were 2075 cases against 2600 cases the same week last year. To meet this shortage there was taken from cold storage during the week 3606 cases against 3791 cases the same week last year. Extras here sold up to 4c up to Monday, case count; pullets unchanged, though they are 8c higher than this time last year. Extras are 9c higher.

Daily quotations:

1918—	Tu.	Wed.	Thu.	Fri.	Sat.	Mon.
Extra	56	57½	58	58½	59½	60

Pullets	40	40	40	42	42	42

POULTRY.

Receipts were fair; also a fair demand for broilers, fryers and hens at steady prices. Turkeys were in good request. Ducks and geese dull.

The following prices were agreed upon last Friday, September 20, and hold good until the coming Friday:

Broilers, 1@1¼ lbs 35c
Broilers, 1½@1¾ lbs 35c
Fryers, 2@3 lbs 31c
Roasters (soft bone), 3 lbs. and up 31c
Stags and old roosters, lb 20c
Hens ...... 26@30c
Tom turkeys ...... 32@35c
Ducks ...... 22@28c
Geese 15c

VEGETABLES.

Under freer offerings the market weakened a little. Demand fair however. Onions declined a little. Offerings good and some poor stock coming in. String beans in better receipts and lower. Cabbage dull and lower. Sweet potatoes steady. Peppers steady. Celery in fair demand and steady.

We quote from growers:

Bell peppers, per lb ...... 2½@3c
Chile peppers, per lb ...... 2½@3c
String beans, per lb ...... 4½@5c
Lima beans ...... 4@5c
Potatoes, local, per lug ...... 75c@$1.00
do, do, per cwt ...... $2.00@2.25
do, northern, per cwt ...... 2.40@2.75
Sweet potatoes, per lb ...... 2½@3c
Garlic, per lb ...... 5@6c
Onions, Stockton Yellow Danvers, cwt ...... $1.50@1.75
Onions, White Globe, per cwt ...... 1.75@2.00
Cabbage, per 100 lbs ...... 1.75@2.25
Celery, crate ...... 3.25@3.50

FRUITS.

The market was well supplied the past week with all seasonable fruit and prices held fairly steady.

We quote from growers:

Figs, Black Spanish, 7-lb box ...... 35@50c
do, White 7-lb box ...... 30@50c
Peaches, freestone, per lug ...... $1.00@1.25
do, clings, per lug ...... 1.25@1.50
Pears, local, per lb ...... 2@3c
Pears, Mountain ...... 3½@4c

Grapes—
Malagas, per lb ...... 2½@3c
do, Muscat, per lb ...... 2@2½c
do, Liberty, per lb ...... 2½@3c
do, Rose Peru, per lb ...... 2½@3c
do, Tokay, per lb ...... 4@4½c
do, Cornichon ...... 4@5c
do, Black Morocco, lb ...... 4@5c
Apples, Bellefleur, 4-tier ...... $1.65@1.75
do, 3½-tier ...... 1.70@1.80
do, Gravenstein, 4-tier 2.25
do, do, 4½-tier 2.00
do, Bellefleurs, local, per lb ...... 2@2½c
Avocado pears, small, per doz ...... 50c@$2.00
do, large, per doz ...... $4.00@5.00
Quinces, lug ...... 75@85c

BERRIES.

Under lighter offerings the market was firmer. The best strawberries brought a little more money. Raspberries were scarce and higher. Blackberries unchanged but firm in sympathy with other berries.

Special Deciduous Market Report

By J. L. Nagle.

Sacramento, Sept. 30, 1918.

The demand in the East continues to be good and though the markets have fluctuated, at no time were the prices lower than the week previous. A few cars of Tokays shipped since the rain have put in their appearance and nearly all of them, though showing the effects of rain damage, have met with a good demand. The markets had previously been cleaned up and what grapes were not sold for table purposes were quickly bid in by wine grape buyers. Practically every variety of wine grape raised in California has been shipped East and to date the market on this class of stock is advancing rapidly. There seems to be no limit to what prices the trade is willing to pay for wine grapes.

Shipments of Malagas are lighter than last week and the market has advanced to a point where the stock is selling equal to and in some cases better than Tokays.

Practically all of the peaches to be shipped are now on the rails and sound stock, both clings and freestones, are selling at prices averaging higher than at any time during the season.

There are a few cars of pears yet unsold. Tehachapi fancy pears have first call.

Emperors are now moving in light supply, but the packing will be heavy this coming week. The quality is excellent and where it is possible to quote this variety packed in sawdust the demand is very active at $4 f. o. b. Lug Emperors are moving on the basis of $2.25 to $2.75 f. o. b. cars.

Averages for the week:

New York: Pears—Winter Nelis, $3.03; Bartlett, $4.33; B. Clairgeau, $3.65; B. Hardy, $3.70. Peaches—Salway, $1.52; Georges Late, $1.85; Phillip, $1.50; Levi, $1.91. Grapes—Tokay, $2.32; Zinfandel, $1.75; Malaga, $2.26; Muscat, $2; Alicante, $2.34.

Boston: Grapes—Malaga, $2.23; Tokays, $2.84; Cornichon, $2.55; Muscat, $2.01; Mission, $1.37; Grenache, $1.30. Pears—Comice, $3.75; B. Hardy, $4.17; Glout Morceau, $3.60; B. Clairgeau, $4.37; Bartlett, $5.13. Peaches—Salway, $2.02; Levi, $1.91.

Chicago: Grapes—Malaga, $2.05; Tokay, $2.29; Zinfandel, $1.40; Muscat, $1.82; Cornichon, $2.28. Pears—Bartlett, $4.70; Comice, $3.50; B. Clairgeau, $3.35. Peaches—Levi, $2.

Shipments, by cars, from September 20 to 26, inclusive: 11 peaches, 63 pears, 1030 grapes. Total shipments to date, 1918: 16,817 cars. Total shipments to date, 1917: 51,443 cars.

Special Citrus Market Report

Los Angeles, October 1, 1918.

The Valencia situation unchanged. Adverse weather in the East caused a temporary lull in the demand for oranges, but the return of better conditions brought the markets back to their normally strong position. On the better grades of fruit there were slight advances in price. The closing up of the season for fresh deciduous fruits is making for a stronger citrus market. Jamaica is beginning to ship its oranges to New York. They average about $4 a box. Florida oranges are expected soon at Northern distributing points. They are being booked at $4 f. o. b. Jacksonville. It is not thought that the Valencia market will be at all affected by these Southern shipments. Indeed, the California crop of Valencias will be practically out of the way the latter part of this month. At this writing there are not more than 500 or 600 cars awaiting shipment, the bulk of which are averaging $8 per box at Eastern points, while some very fancy brands have topped the $11 mark. Quotations f. o. b. California points still hover around the $7.50 mark. Southern California promises early navel shipments.

The lemon market, which has been dormant for some time past, shows signs of new life, and there is now a limited demand for fresh supplies. The glut of foreign lemons in the East is clearing up, which will doubtless stimulate the demand for the California product.

Total shipments of citrus fruits from Southern California for the season are: Oranges, 13,975 boxes; last season, 38,497; total shipments of lemons for the same period are 5510 boxes; last season, 7471 boxes.

Strawberries—
Fancy, per 30-basket crate.....$2.25@2.50
Poor to choice, 30-basket crate. 1.50@1.65
Blackberries, 30-basket crate.... 2.50@3.00
Raspberries, 30-basket crate..... 3.50@4.00

MELONS.

Watermelons were in good supply and sold fairly well. The cantaloupe season is drawing to a close. Casabas in good supply but slow sale. Honeydew melons a little lower.

Cantaloupes—
Tip Top, home-grown, standard crate .....$1.15@1.25
do, do, pony crate .....70@80c
do, do, jumbo crate.....$2.50@2.75
Columbia, jumbo crate ..... 2.75@3.00
Paul Rose, standard crate.....$1.25
Casabas, per lb.....1½@2c
Pineapple, standard crate.....$1.15@1.25
Watermelons, per 100 lbs..... 1.00@1.25
Honeydew melons, 16-inch crate 1.00@1.10
do, jumbo crate ..... 3.00@3.25

HAY.

Not much in and very little wanted. The dairy people bought a little alfalfa, but horse hay went begging. Prices, under light receipts, were unchanged. No one seemed to care to buy ahead.

Barley hay, per ton.....$24.00@26.00
Oat hay, per ton..... 26.00@28.00
Alfalfa, northern, per ton..... 21.00@22.00
Alfalfa, local, per ton..... 22.00@24.00
Straw, per ton ..... 9.00@10.00

BEANS.

Limas continue in fair demand and there was some little movement in pinks; other varieties neglected. Buyers holding back on account of slow Eastern markets.

We quote from growers—
Limas, per cwt.....$11.50
Large white, per cwt..... 10.00
Small white, per cwt..... 10.00
Pink, per cwt..... 7.50
Blackeye, per cwt..... 6.25
Tepary, per cwt..... 8.50

COTTON.

There was more trading and a decidedly more bullish feeling in this market the past week. The announcement that the Government would not fix prices for the present encouraged buying and by Saturday October in New York reached 33.27c and closed at 32.77c and December closed at 33.04c. On Monday the announcement that Bulgaria had signed an armistice started fresh buying and caused a further slight advance. October closed in New York at 33.60c and December 33.23c. In New Orleans October closed at 32.21½c and December 31.83c.

Special Livestock Market Report

San Francisco, Oct. 2, 1918.

CATTLE—Cattle receipts in San Francisco are coming principally from Oregon, with a few from Nevada. These, together with the California offerings, are more than enough to take care of all local demands. Quotations unchanged.

Grass steers—
No. 1, weighing 1000 to 1200 lbs..11½@12c
No. 1, weighing 1200 to 1400 lbs.11½@11¾c
Second quality .....10@10½c
Thin .....8@9c

Cows and heifers—
No. 1 .....7½@8c
Second quality .....6½@7c
Common to thin.....4@5c

Bulls and stags—
Good .....6@7c
Fair .....5@6c
Thin .....4@5c

Calves—
Lightweight 11c
Heavy 8½c
Medium 10c

HOGS—Hogs are now coming in quite freely and are of good quality. Packers have some difficulty in absorbing the supply on account of diminished killing capacity due to the shortage of suitable labor to handle the animals. Quotations have declined a quarter of a cent on all classes.

Hogs—
Hard, grain-fed, 100@140.....17¾c
do, do, 140@300 .....18¼c
do, do, 300@400 .....17¾c

SHEEP—Quite a lot of ewes are offered in this market, but not many wethers. While lambs are not plentiful, there are still enough to go around and fill all demands.

Lambs—
Yearlings .....12@12½c
Milk .....14@14½c

Sheep—
Wethers .....11½@12c
Ewes .....9@9½c

Los Angeles, October 1, 1918.

CATTLE—Few choice fat cattle were offered the past week, and they were in good demand. Plenty of thin and medium stuff was to be had, with little demand.

Per cwt. f. o. b. Los Angeles—
Beef steers, 1000 to 1100 lbs....$9.00@12.00
Prime cows and heifers..... 7.50@ 8.50
Good cows and heifers..... 7.00@ 7.50
Canners, per cwt..... 5.00@ 5.50
Calves, per cwt..... 8.50@ 9.50

HOGS—Receipts the past week were the best for some time and under the influence of freer offerings the market was slow and weaker. The offerings were of better quality.

Per cwt. f. o. b. Los Angeles:
Heavy, averaging 275@300 lbs..$15.50@16.50
Mixed, 225x275 lbs..... 16.00@17.00
Light, 175@220 lbs..... 16.50@18.00

SHEEP—Choice muttons and lambs continue scarce, firm and in demand. Poor and medium stock is weak.

Per cwt. f. o. b. Los Angeles—
Prime wethers .....$9.00@10.00
Prime ewes ..... 8.50@ 9.50
Yearlings ..... 9.50@10.50
Lambs .....15.00@16.00

PORTLAND LIVE STOCK.

Portland, Ore., Oct. 1.—Cattle, steady; receipts, 300 head. Steers, prime, $12 to $13; good to choice, $11 to $12; medium to good, $9.75 to $11; fair to medium, $8.25 to $9.25; common to fair, $5.75 to $8.25; cows and heifers, choice, $8 to $9; medium to good, $5.75 to $7.25; fair to medium, $4.75 to $5.75; canners, $3 to $4; bulls, $5 to $7; calves, $9 to $12; stockers and feeders, $6 to $8.

Hogs, steady; receipts, 510 head. Prime mixed, $19.50 to $19.75; medium mixed, $19 to $19.35; rough heavies, $18 to $18.35; pigs, $16 to $17; bulk of sales, $19.35 to $19.50.

Sheep, steady; receipts, 48. Prime lambs, $12 to $14; fair to medium, $9 to $11; yearlings, $10 to $11; wethers, $9 to $10; ewes, $6.50 to $9.

SPEED
Is Winning the War

When the news was flashed over the wires, "America Declares War," the answering thought of the people of the world was the one word—"speed."

That was their conception of our characteristic national trait—"speed."

Coincident with this news came the demand upon America's farmers to feed the world.

This demand continued to increase calling for the utilization of the most efficient time saving and production increasing methods.

The value of the motor car to farmers cannot be measured in dollars.

It has won its place as a necessity together with the reaper, the plow and other modern implements.

The economy, steady performance, and all 'round usefulness and complete satisfaction of the Overland Model 90 car has earned the universal esteem of American farmers.

Overland cars everywhere are helping their owners speed up the work of a nation at war, dependably, thriftily, saving time and economizing man power, alike for the captains of industry, the workers in industry, and for the farmers, large and small, and the farm workers.

Everywhere lines of communication between the great agricultural sections and the great industrial centers are being kept open by time-saving, man-saving Overlands.

We want every Overland built and delivered during the war to contribute its share to the war-speed of the nation.

And speed is winning the war.

THE PACIFIC RURAL PRESS

Forty-eighth Year

SAN FRANCISCO — OCTOBER 12, 1918 — LOS ANGELES

What Co-operation Has Done For Raisins

[Written for Pacific Rural Press by John J. Fox.]

The fruit of United effort is progress. Progress means success and satisfaction. "Satisfaction," says Marcus Aurelius, "consists in doing the things we were made for. And how is this to be compassed? By the practice of general kindness—by distinguishing appearance from truth and by contemplating the nature of the universe and its works. The keynote of Nature is Harmony.

Harmony is the strength of all Societies and implies co-operation.

UNION IS STRENGTH. After more than twenty years of suffering under marketing conditions that made the production of raisins a slave-like undertaking, there came a time when the growers were compelled to unite in an effort to escape the thralls by deciding to market their own fruit instead of allowing it to be marketed for them. Either that or give up the game.

They said in effect: "The average returns for our raisins are so little more than the cost of production as to provide a bare existence. We cannot improve our properties; if we run behind or have a mortgage to carry, our "finish" is only a question of time. We have been exploited long enough. Let us market our own fruit.

Genesis of the Associated Raisin Company.

Repeated attempts were made to organize and much valuable work was done in these attempts, in outlining the raisin growing district, platting the farms and filing exact records of the acreage planted to vines or in bearing. Finally it was decided by the growers that no plan to market their wares would succeed without a real paid-in cash capital to provide funds for handling, marketing, and distributing their crop—a stupendous undertaking.

The California Associated Raisin Company was the outcome of their deliberations and was really a development from the "Raisin Exchange," formed two years earlier, and whose members had done so much valuable spade work. It is unnecessary to recapitulate the terms under which it was formed—it was a long, arduous fight, and with foemen worthy of their steel. But the California Associated Raisin Company came into being in 1912, with stock subscriptions from the growers totaling three-quarters of a million dollars. Contracts were signed by the growers guaranteeing the delivery of their crops to the association for five years—76 per cent of the acreage—as it was found that control of their own crop could not be secured unless at least 60 per cent of the output was assured. In this way the speculative element was discounted and the whole industry stabilized, as will be shown.

The magnificent new building now in process of erection at Fresno for the use of the California Associated Raisin Co.

The First Step—Speculation Eliminated.

The first thing the Associated Raisin Company did was to buy from the growers 25,000 tons of raisins—the holdover of the crop of 1912—for 2½ cents a pound, at a time when independent packers would offer no more than 1¾ to 2 cents a pound. They then leased packing houses from the commercial packers, having as yet no packing houses of their own. Separate contracts were entered into with fourteen packers and the association handled 85 per cent of the crop in 1913, or about 120,000,000 pounds! On the crop of 1913 it had guaranteed the growers a minimum price "on delivery" of 3¼ cents a pound for Muscats in the sweat-box. This necessitated the securing of three million dollars' capital. Through local and San Francisco bankers this was done, and many growers left money due them for raisins with the company at 7 per cent interest, which gave several hundred thousands of dollars more for its use.

In 1913 the Associated named prices to the trade and guaranteed them against declines. This they could do only because speculation in raisins had been eliminated. The close of the year gave the growers more than $400,000 in excess of the guaranteed minimum price. The Associated paid $12 a ton above what had been the prevailing price during the four preceding years.

"If You Want Business You Must Go After It."

Increased production necessitates increased consumption, and the heads of the new Associated Raisin Company, being men of affairs, decided that two things must be done to extend their markets: (1) Advertise their wares in a large way; (2) standardize and guarantee their pack under a brand that should be recognized and respected all over the world.

The individual packers had never been able to agree on co-operation to advertise, so any new market was, so to speak, a sort of "volunteer crop." Any new business came through the work of jobbers and wholesalers, and this was altogether too slow for such a rapidly growing staple industry. The Associated, through a large Eastern advertising firm, has carried on a persistent and nation-wide advertising campaign that has made the California raisin under its own "Sun-Maid" brand an article of daily use in every household; for it is probably one of the lowest-priced dried fruits on the market compared with its food value. A part of the system of advertising has been to provide the public with recipes for its use. The use of it by bakers has brought raisin bread into vogue, which has come to stay. Demonstrators have been at work all over the country showing various methods of cooking and preparing. This year the company has allotted $375,000 for advertising alone. All this has resulted in there not only being no holdover, but demand keeps pace with the increased production.

Standardization and Inspection Improves Quality.

Standardization and inspection has resulted in improved quality of the fruit and confidence in the pack. Experts have been employed to improve the handling and machinery necessary. Co-operation brings the growers in closer touch with one another and results in improved methods of cultivation, pruning, harvesting, and delivery.

It has come to this then—that the California Associated Raisin Com-

EDITORIALS

A GOOD YEAR AHEAD.

THE Chronicle's special leased weather prophet, S. V. Rehart of Lakeview, Oregon, has just made another grab at the mantle of Elijah, although he did not reach even the outmost fringe thereof in the grasp he made for it last year. Mr. Rehart excuses his miss of last year by this statement:

It was my first disappointment in making forecasts since 1906. Furthermore, it is the first time during forty-six years of personal observation that a hot summer was followed by less than normal precipitation.

That is surely a very good record and we congratulate Mr. Rehart upon it. However, we do not forget that California rainy seasons are usually good: that our normal rainfalls are usually equal to good crops in places where it is expected to get them without irrigation: that, if this were not the case, the American conception of California's agricultural potentiality would be worse than the Spanish and the tillage prophet Campbell would have been thrown on the vaticinal scrap-heap long ago. In other words, California seasons are predominantly good and an optimistic prophet is therefore bound to make a good average. It is, however, very joyful to find a prophet who keeps on foretelling exactly what we have every reason to expect. It is infinitely better than to follow another prophet whose predictions, if realized, would transform our grand semi-arid valleys into dismal swamps. Therefore, we welcome Mr. Rehart's prediction for the crop year now beginning, as follows:

For the season of 1918-19 I expect more than normal precipitation, with the precipitation extended over a longer period of time than the past two seasons, with several alternating periods of wet and dry spells in the valleys and heavy snows and cold spells in the mountains.

THE EXPECTED WILL HAPPEN!

THIS is surely rational. As we began with September rains which were in most places the heaviest ever received since the American occupation, it is of course to be expected that the precipitation will extend over a longer period this year than usual. It is also to be expected that we shall have "alternating wet and dry spells in the valleys, with heavy snows and cold spells in the mountains." That is the way our rainy seasons always conduct themselves, when they perform normally at all, and it is of course comforting to be reminded that it is to that we have every reason to look forward. Therefore, we accept the apology which the Chronicle makes for its protege that "he claims no scientific aid in his observations." We prefer a prophet who works with a good trustworthy "hunch" to one who claims to work by solar science, which cannot be connected up with earthly affairs by demonstration either of causation or coincidence.

We must, however, remind the reader that there is a very close analogy between weather prophecy and peace prophecy, and just at the moment it is very important not to put too much trust in definite allegations of either. We want plenty of rain and plenty of peace this winter and we fully believe we shall get both if we do not slacken but go ahead vigorously toward attainment of both. We shall have had the rainfall when we get to the springtime and we shall have the peace when our boys get across the Rhine!

THE BACKWARD LOOK OF PROPHECY!

THE more we think of weather prophets and peace prophets the more we are impressed with the value of hindsight. Take the case of the crumbling Huns, for instance. They have great difficulty in discerning the fact that the world has its heels on their ears and their peace antics would be funny if they were not so tragic. They are now bombarding the forces of humanity with pleas for peace in order that human lives may be saved! Either way you look at it, it is a demonstration of stupidity. The Huns may think that the allies prefer peace to a death struggle for the right; or that they have made such a score as super-men that mankind is scared of them and their policy of frightfulness, or that the allied nations are so permeated with passivism that their bluff at mercy will make limburger of the milk of human kindness. And so there came to President Wilson the other day a special plea from the German rulers with this allegement:

The German Government requests the President of the United States to take in hand the restoration of peace, acquaint all the belligerent states of this request and invite them to send plenipotentiaries for the purpose of opening negotiations. It accepts the program set forth by the President of the United States in his message to Congress on January 8 and in his later pronouncements, especially his speech of September 27, as a basis for peace negotiations. With a view to avoiding further bloodshed, the German Government requests the immediate conclusion of an armistice on land and water and in the air.

We are at a loss to know along which of the lines of stupidity cited above this argument travels, but it clearly manifests impotence in foresight proceeding from a total absence of hindsight. It is effrontery which can come alone from stupidity and conceit. It is a proposition to talk about "avoiding further bloodshed" with no admission of guilt or grief for the streams of blood which have been flowing for four years and a half from its declarations of ultimata; its mobilization of murdering armies to pursue hell-born purposes; its invasion of peaceful countries and subjection of peaceable people to death, outrage, robbery and enslavement; its barbarous crimsoning of the seas with the blood of babes and its continuous desolation of invaded countries, deporting their populations to slavery even while it is being driven backward by the armies of righteousness which its own abominations have rallied to the defense of the world.

The Huns are willing to accept the declarations of this country "as a basis for peace negotiations"! There can be no negotiations for peace except upon the basis of unconditional surrender! President Wilson may not tell them that in so many words, but that will be the tenor of his answer. It is the only thing which this country will stand for and if the Huns had any insight and hindsight they would welcome the after-treatment as more merciful than anything they ever planned for the people they essayed to subjugate! And, fortunately for all mankind, it will soon come to that! Buy some more Liberty Bonds: let the kaiser see in them "a basis for peace negotiations."!

WAR GARDENS AND PEACE GARDENS.

WITH reference to the distinguished contribution which Secretary Lane makes to our production-promotive effort, upon another page of this issue, we desire to remark that all that he so forcibly urges as relations of home-gardening and school-gardening to the current war emergency are also relations of these gentle arts to the permanent and prosperous development of the country during the reconstruction period which will follow the war. The earnest thinking which this country has been called upon to do concerning food-producing and food-saving for war purposes will have incalculable influence in strengthening the foundations of thrift upon which will rest the new attainment of prosperity for generations to come. Let us regard Secretary Lane's notable contribution, therefore, not at all as a temporary expedient, but as an enduring force—a force to win now, a force to wear hereafter. We have been drifting into national disregard of the fundamental facts of individual sustenance and of national maintenance and naturally we have been losing sight of the fundamental importance of food production and of the industrial rights and privileges of those who make it their life work. We have been glorifying the functions and increasing the rewards of all who have provided capital, supplies, transportation, hired labor and trade-facilities for food products to such an extent that we have been nationally negligent of the justice and fairness to the owners and operators of farms by whom alone food production can be maintained. We believe the time has come for farmers to secure justice and fairness by organization and affiliation of their industries, because all people have been taught by the war to recognize their dependence upon farming and they are therefore ready to assume a new attitude toward farming which shall express their recognition of such dependence. Farmers should push organization to give that attitude, toward which all people are now disposed, practical embodiment and permanence in individual and national behavior and policy. If it is not now done quickly, there is great danger that the old state of the public mind, which was one of negligence and inappreciation of the need of making food production secure through the recognition of the proper place of the producers thereof in national affairs, may reassert itself. If farmers will organize strongly now to secure proper, definite recognition of their rights and relations, the future will be made secure through the work which is now entering so forcibly into the curricula of the schools. It will be through the work of the schools that Secretary Lane's declarations, upon another page of this issue, will lay hold upon the future and have potentiality in making the prosperity of the country permanent and progressive.

The announcement by Secretary Lane that he has given local leadership in this branch of the work of his department to Prof. C. A. Stebbins, formerly of the State University and more recently of the Chico Normal School, will give satisfaction. Prof. Stebbins is known to our readers not only for his excellent school work in elementary agriculture but for his good work upon his own farm, of which a suggestive account was given in the Pacific Rural Press of February 16 last. The whole thing looks mighty good to us!

SHALL A FARMER BECOME A "JINER"?

WE HAVE received a very pertinent question which we desire to answer as prominently as possible. It is mooted in this note:

To the Editor: I believe in organized farming both for buying and selling purposes, but how much or how little of it I should undertake I cannot figure out. I own twenty acres, or shall when I get it paid for. I joined the Dairymen's Association about six months ago, as dairying is going to be my main business, but I will probably be selling about twenty fat hogs a year. My wife keeps about a hundred hens and for the sake of rotation I raise some beans. These crops are represented by four different associations. Would it be practicable for me to join them all or in just one line where I will be able to count for something?—N. S., Turlock.

You have made a good start by joining the association which will handle your main line co-operatively. Hogs and hens will probably be permanently associated with your main line and therefore their products will be continuous. It is just as important that you get all that you are fairly entitled to from your pork and poultry products as from your cream, though the receipts are relatively less, and you should therefore be represented in wise co-operative efforts to get full returns from by-products as from your principal product—for it is often the case that the by-product carries the profit on the whole season's work.

It is not a question in righteous co-operation

that you should individually "count for something." The true principle of co-operation is "one for all and all for one." Therefore your strength and influence are essential, not that you should individually count but that the principle should prevail. The reward for the prevalence of the principle is that you and every other co-operator shall get what he is fairly entitled to for his labor and investment. If your production entitles you to act with several groups of producers, you and they are all entitled to your and their participation in the mutual efforts which are the only protective and promotive recourses we know of for you and for them.

The burdens of membership in associations which cover and protect your special products should not be great. The preliminaries of organization may seem large, but in subsequent operation the product should bear the cost of its handling, which should be less than current commission charges, and membership cost should be nominal. This is the experience of all our special product co-operations which have come through to success, for the pecuniary advantages of membership have made the cost thereof look like thirty cents.

WHY SPECIAL PRODUCT ASSOCIATIONS?

WE HAVE two reasons for advocating special associations of all groups of producers: first, it is the only way that an association can master full knowledge of its material and expert handling of it, like that which old-line dealers have so long commanded for their own advantage; second, we know of no association which has undertaken to handle all kinds of products for all groups of producers which has ever commanded wide influence and success. It is an age of specialization and the ideal attainment is for each special product to be practically concentrated in the hands of producers' representatives who know exactly what can be done with it and how to do it. If, therefore, in your case you are represented in all the associations handling your products, you place yourself in position to get all there justly is in each of them and you "count for something" in all of them because you are carrying your share of the co-operative effort.

As these special-product co-operative associations attain a workable share of the products, they should unify their general effort for things which affect them all, by affiliation in representative organization and assembly action. This is the only direction in which we can foresee broadly influential force toward the attainment of things that ought to be. Every farm should take active part in the promotion and protection of all commercial products it puts forth. Of course it is not necessary that you should personally take out all the memberships. As a California citizen your wife should do her full duty as a "jiner" for all the products in which she is particularly concerned—whether it be a mothers' club or a chicken association.

QUERIES AND REPLIES

By the Editor.

Inquirer Must Give Full Name and Address.

Fruit Trees on "Gravelly Loam."

To the Editor: Last year I bought 18 acres of land. I presume that years ago this land was planted to grain, as there is a granary on the place, and after the land was worn out for grain it was planted to prunes; afterwards, olive trees were planted between the prune trees, and finally the place was neglected altogether. It was then put on the market for what I thought was a reasonable price and I bought it with a view of taking all of the old trees out and planting a new orchard to prunes. All of the old trees are now out. The neighbors have been knocking this place and have been telling me that the land is too poor and that I would be foolish to improve it. The land is a gravelly loam, with plenty of boulders in it to a depth of about 60 feet. Do you think that it would be advisable to plant this land to prunes and try to enrich it by fertilizing. I am told that putting fertilizer in the holes for the trees kills them.—Investor, San Francisco.

Of course one can only guess at the character of a piece of land which he has never seen. An intelligent opinion must be based on sight—not only of the surface but considerably below it. It is necessary, for instance, to know how much gravel and how much fine dirt there is in a "gravelly loam." And if there is a good proportion of fine dirt, it is then necessary to know how much water there will be available by irrigation, for too gravelly a soil cannot hold enough moisture from rainfall to grow good trees and fruit crops—no matter how heavy the rainfall may be. And if the trees do not get moisture enough it does matter how much fertilizer you give them, for they cannot use it. If you have plenty of water, use fertilizers on the top of the ground after planting and not in the hole, and plant prunes on almond root, which has maximum penetration and drouth-resistance. In this way you may get your money back by re-selling to a bigger sucker just before the trees get to bearing age. We do not know what they will do after that. Of course if you have bought a gravel bed under the name of "gravelly loam," about all you can get from it will be what will grow while the rain is falling. Your neighbors know the place better than we do. They may be good knockers, but you must remember that there are some things that have to be knocked, and one of these is an acreage of creative rubbish as a site for fruit planting.

The Fruiting of the Quince.

To the Editor: I have a fine, thrifty quince tree, which has been bearing about five years, but persistently drops its fruit, sometimes entirely, sometimes a half dozen will mature, sometimes a few more. I have been advised to put common salt at the root, but it appears so unnatural and against common sense that I have not done it. Is the advice good?—Amateur, Marin county.

Probably the only way common salt can promote fruiting of the quince is by killing some of the roots and thus reducing the vegetative vigor of the tree. The chief reason of the non-fruiting of the quince is the continuous growth of whip-like shoots and the lack of development of strong buds which make short new shoots from the previous growth on which blooms and fruits appear. This preparation for bearing is promoted by summer pruning—thinning out or reducing the number of shoots and stopping the extension of those which you retain by pinching the tips and causing them to send out laterals. This should be done in June, when the new growth has run out a foot or two. When the foliage is reduced by opening the center, removing a great many shoots entirely and shortening the others, the overgrowth of wood is discouraged and the remaining force of the plant is exerted upon strengthening the fewer shoots which remain to be acted upon. Of course winter pruning will not do this, for its effect is to cause more and not less wood growth. There is probably nothing you can do as late as this for next year's crop.

Corn Smut.

To the Editor: I have a very good tonnage of Indian silage corn. The ears are very smutty. What would you advise doing? Would it pay to pull off the bad ears?—R. C., Hollister.

In growing corn for a grain crop smutty ears should be removed and burned because the disease lives over easily in the stalks or in the manure and attacks a following crop. Smutty ears should be watched for and removed whenever seen while the crop is growing; if not already done, they should be removed when harvesting the crop and not fed with the stalks, but burned. In growing corn for silage we are not aware whether the effect of the fermentation upon the life of the spores has been determined or not. Presumably they are not killed, for they go through more vigorous attacks in the animal digestion and retain their activity, as is shown by outcropping of smut especially on manured corn fields. So far as the effect of corn smut on the animals is concerned, it is negligible and not dangerous, as some other grain fungi are. We doubt if it would pay to pay much attention to it in silage cutting.

Wheat After Barley.

To the Editor: I would like to know if, after taking off a barley crop, it could be followed by wheat. I had 80 acres of barley cut with a binder. I had the land plowed and harrowed about 8 inches before this last rain, as I thought it would act as a partial summer fallow, with the idea of taking off a volunteer crop of hay, as there was enough grain left by the binders to produce one. Do you think I could now sow the place to wheat, and if I do I suppose it would be necessary to plow or disk again to destroy the sprouting barley? When would be the best time to do it—now or in the spring?—P. A. R., Dinuba

Disk out all the barley that starts now and repeat the operation once or twice if conditions start new growth that often. This will clean the land pretty well so wheat can go on in December. Do not try it in the spring or you will get no wheat. California wheat has to make a start early in the winter and get all the growth it can to head well in the spring.

We Need You

to represent us in the field in place of those who have been called to the colors. The work of securing new subscriptions and collecting on renewals is pleasant, dignified and healthful, and the salary is ample.

Experience is neither essential nor objectionable. If you have an automobile and are not afraid of hard work, we can use you.

No objection if you are along in years, provided you haven't lost your pep. If you really like the paper and think you can convince others of its merits, your first step toward Greater Success will be to write us a little about yourself and give us an opportunity to tell you what we have to offer.

Only a few positions open. Better write today.

Do Legumes Currently Help Grain?

To the Editor: Does the seeding of inoculated vetch or field peas with grain produce better yields than straight seeding with grain? Also, how about the harvesting of such a mixture with a binder or combined harvester?—F. C., Marysville.

There is some reason to think that legumes may contribute some plant food to grain growing with them, but whether, under ordinary conditions, they will help the grain in this way more than they will reduce the product of it by using up moisture the grain should have, is a serious question. Probably from the point of view of a grain crop such legumes simply act as weeds: while when growing grain for winter pasture the legumes may be a very great advantage. Grain grown with legumes can be harvested in usual ways, but the seed must be separated by a cleaner.

Why Grain the Silo?

To the Editor: How would it do to put barley with corn that is shy of ears, when filling the silo?—C. F. W., Tancred.

If you mean threshed barley, we would rather put it in the cow than in the silo because you can feed it or not, or feed it in varying amounts, according to what you expect the animal to do for you. If you mean to cut unthreshed barley into the silo, there may be the same reason that there is for cutting in the ears in siloing a corn crop—you save the cost of getting the grain out separately, make a richer silage and get the value of the grain that way at less expense. But in cutting in a lot of dry, unthreshed barley with the corn you will have to be sure that water enough goes in with it.

A Dose for Johnson Grass.

To the Editor: Is there any spray that will kill Johnson grass and not harm cattle? I want to use it along fences and ditches and in corners where I cannot get at it with a plow.—L. A. W., Merced.

You can kill it with a good dose of common salt or of alkali, which you might scrape up from alkali spots if you have not had rain enough to dissolve the inflorescence of the dry season. This would also kill the soil for some time, but as it is for corners which you were not cropping anyway, such infertility of the corners would not matter. On ditch banks the salt would probably be too much diluted to render the water injurious to plants.

Inoculation for Legume Land.

To the Editor: Would one benefit by using bacteria culture on seed to be used on land that has grown successfully good crops of alfalfa and beans for the past seven years?—L. C., Live Oak.

No.

California Weather Record

The following rainfall and temperature record is furnished the Pacific Rural Press by the United States Department of Agriculture Weather Bureau at San Francisco for the week ending at 5 p. m., October 8, 1918.

Stations	Rainfall Data: Past Week	Season's To Date	Normal To Date	Temperature Data: Max'm	Min'm
Eureka	.34	2.17	2.00	64	48
Red Bluff	.46	7.85	1.16	82	52
Sacramento	.30	3.88	.57	78	50
San Francisco	.09	2.66	.47	75	54
San Jose	.10	6.44	.54	80	46
Fresno	.01	.59	.47	84	56
San Luis Obispo	.00	1.47	.65	78	52
Los Angeles	T.	.66	.14	78	62
San Diego	.35	.54	.14	74	64

United States School Garden Army

Written expressly for Pacific Rural Press by Hon. Franklin K. Lane, U. S. Secretary of the Interior

ORIGIN.

The United States School Garden Army was organized in March of 1918.

President Wilson set aside $50,000 from his National Security and Defense Appropriation to promote the work for the first six months. He has since appropriated $200,000 more to carry the work through another ten months.

PURPOSES.

Two main purposes prompted the planning of the United States School Garden Army: (a) Increased food production, and (b) training of school children in thrift, industry, service, patriotism, and responsibility.

The necessity for man power was being felt. This was especially true in agricultural pursuits. Not alone were the drafted young men going from the farm, but great numbers of farm employees were being attracted to the cities by higher wages offered in other industries. If the millions of city boys and girls could be induced to give their leisure time to cultivating the thousands of acres of untilled land in front and back yards and vacant lots of our cities, towns and villages, it would result in a substantial increase in food production and an improvement in the quality of our coming citizenship.

The Bureau of Education undertook to accomplish this through the organization of the United States School Garden Army. It is an educational problem and can be solved with economy and efficiency only by the schools.

PLAN.

The plan of organization involves: (a) a general director, who is responsible for organization, propaganda, and administration. (b) Regional directors, who are charged with the responsibility of writing instructions upon gardening that will enable supervisors and teachers to take a garden company successfully through a season, even though not expert gardeners. These instructions have been put out in leaflet form and sent from the central offices to all who applied for them. (c) Assistant regional directors, who work under the regional director and whose duties are similar to those of the regional director excepting that of writing garden leaflets. (d) Co-operation with State Council of Defense through a State representative appointed by them. (e) The Army plan of organizing school boys and girls into companies of 150 or less under the direction of a garden teacher, a captain, first lieutenant and second lieutenant. (f) An insignia for each enlisted soldier. A double bronze bar for the captain, single bronze bar with two stars in the border for the first lieutenant, and one star for the second lieutenant, and a combination bronze and black enameled bar for privates.

SECRETARY OF THE INTERIOR
WASHINGTON

September 26, 1918.

My dear Mr. Wickson:

We are preparing for next year's campaign for the School Garden Army. This year we had, as you know, approximately a million and a half children in this Army. Next year we are aiming to multiply this at least by two, and we hope by three, and in this work we must ask your aid. I have appointed Mr. C. A. Stebbins of San Francisco, Cal., Regional Director, to have charge of the work in your territory, and have asked him to see you on his first visit to your city. If you can by the methods so well known to newspaper men induce the children to vie with one another as to making these gardens, the work will be a success. Could you announce, for instance, that you would publish, say every week, the three best 100-word letters from children telling of their pride in their gardens or the difficulties with which they meet? No doubt you can find methods by which you could produce rivalry between your city and other cities and between the different schools in your city. I am enclosing a brief statement of the organization of the United States School Garden Army.

Cordially yours,

FRANKLIN K. LANE.

Mr. E. J. Wickson,
Editor, Pacific Rural Press, San Francisco, Cal.

WHAT HAS BEEN ACCOMPLISHED IN SIX MONTHS.

1. One million five hundred thousand boys and girls have responded to the call of the President and enlisted in the United States School Garden Army.
2. Twenty thousand acres of unproductive home and vacant lots have been converted into productive land. This will release an equal acreage now used in truck gardening for the production of other foodstuffs more important for war purposes. It will also relieve transportation congestion through home consumption of home produced foodstuffs.
3. Fifty thousand teachers have received valuable instruction in gardening through the garden leaflets written by experts in this office and distributed from here.
4. Boards of Education and other civic organizations have been influenced to give financial and moral support to the school and home garden movement and to pay extra salaries for supervision and teaching.
5. Hundreds of thousands of parents have become interested in the garden movement and are working with their children in home gardens. In Salt Lake City alone 5200 mothers, representing sixty-two parental associations, are actively supporting food production in the schools.
6. Thousands of civic, commercial and patriotic organizations have become interested in the movement and are giving it hearty support.
7. One and one-half million children have been given something to do this summer—something that will help carry the burden of their country in this struggle for freedom, something that will help them to build character and something that will appeal to and develop their patriotism.
8. Home and vacant lot gardening in cities, towns and villages have been dignified and made popular to a degree that practically insures them a prominent place in the school system of our country. It would be difficult to estimate the educational and material value of such results.

Humboldt Co. for Winter Apples

Written for Pacific Rural Press by John J. Fox

NOW that Humboldt county is so accessible to the markets, there is no reason why she should not become one of the leading winter apple producing sections of the State. The State highway now being completed will link her up directly with San Francisco, and it is probable that in the near future as much or more traffic will pass over that highway than now passes over the railway—barring lumber. A system of good roads that is gradually being built up will do more for the development of Humboldt than any other one thing.

The above view is typical of the beautiful Humboldt County scenery.

Of all the fruits the apple seems better adapted to Humboldt county than any other tree fruit. There is almost unlimited scope for its production. The apples produced here are of firm, crisp texture, with good carrying and keeping qualities, and have always the beautiful color that more northern latitudes and mountain sections impart.

THE VARIETIES BEST ADAPTED.

The varieties produced are the Wagener, Esopus Spitzenberg, Yellow Bellflower, Rhode Island Greening and Tompkins King among the leaders. Others that should do well here in the mountains are the Rome Beauty—one of the best keepers and a late bloomer; Jonathan, of striking color and keeps well till Christmas, and Baldwin. Color always sells, and Humboldt county can grow late apples that, under proper conditions, should keep over till the following April—some varieties. Well-built packing houses are needed. In course of time Humboldt apple growers will cut their commercial pack down to the varie-

Farm Products Must Increase

If we are to win the war and win it quickly our soldiers and our allies must be well fed. We cannot expect them to do their best to win unless we do our best to back them up. How are you going to make every acre of your farm produce to its utmost? Just as our army must be well fed so your soil must be fed. You must supply it with the elements necessary to produce crops.

GOLD BEAR FERTILIZERS

are scientifically manufactured to meet California soil conditions and crop necessities. They are made from animal products that contain the necessary elements to feed your crops.

ties best suited to them, centralize the handling and marketing and provide better storage. There are too many small orchards with a number of different varieties of apples in them and the trade cannot be served to advantage under such a diffusion of effort. As for the local market, it is soon swamped. The commercial grower can only prosper when carload lots can be accumulated, as at Watsonville, where Bellflowers and Newtown Pippins predominate, and at Sebastopol, where the chief variety is the Gravenstein.

BOUNDLESS OPPORTUNITIES FOR THE APPLE GROWER.

Humboldt county at present claims to be free from codling moth, but scab is not entirely absent. There are some sections where good apples could doubtless be produced with a permanent clover pasture for hogs or sheep beneath the trees after they are eight or nine years old. Some redwood sections along the coast hills would be suitable for this. To take care of the culls, evaporating plants should pay in a section where fuel is so cheap and easy to obtain. The writer has been over every section of Humboldt county in the last year and sees endless opportunities for the farmer and apple grower as the land is reclaimed. J. F. Benton, the enterprising Horticultural Commissioner of this county, is an apple grower himself and should be a good man to consult by prospective planters.

HOW TO GET INFORMATION. MARKETS.

A treatise on "Apple Growing in California" was written by George P. Weldon, chief deputy of the State Commission of California, which is the most practical and comprehensive booklet that has yet been published. It could be had by writing to the State Commission of Horticulture and the entire edition was quickly exhausted. We hear that another edition is to be issued as soon as possible by the State Commissioner. Any intending grower can ascertain from Mr. Benton whether his land and location are suitable for apples. If not, whether it can be made suitable by drainage; what are the best varieties; those most largely grown, and which can be most profitably marketed. Also ask particulars of the possibility of evaporating apples and the cost of a large or small equipment. Humboldt can certainly compete with other sections in this particular, for, cheap as fuel oil is to purchase, the waste wood in this county should be cheaper still.

What Stable Manure May Be Worth

To the Editor: Are there any available statistics that would give me a line on the value of cattle manure? I contemplate using some on a prune orchard the soil of which needs humus and find the cost of same, freight, hauling, and spreading on the land, runs high. Up to what figure per ton would you say I am safe in spending? At what cost does it cease to be profitable?—B. F. J., Alvarado.

[Answer by Prof. P. L. Hibbard, University of California.]

The value of manure may be determined most certainly by measurement of the increased crop produced after addition of manure. This takes too much time and trouble, in most cases, hence the need for some laboratory method of evaluating manure. No such method has yet been devised, so that it is still necessary to use some indirect means of estimating the value of such material.

By some investigators, as Director Thorne of Ohio, it is claimed that the value of manure lies simply in its content of plant food, which may be accurately determined in the laboratory, thus putting it on a sound basis of pounds and cents value. But most students of the question believe that manure has great value as a source of organic matter, especially on worn-out soils. Conceding this, it is evident that the same manure will be more valuable in one case than in another, in proportion as the soil on which it is applied is more or less depleted. The same is true of fertilizers in general. The more impoverished is the soil, the greater is the benefit from a given amount of fertilizer.

The value of manure, then, depends on its content of plant food and organic matter, and these vary according to the animal, its feed, and the manner of preservation of the manure. Old rotted manure is more desirable in some respects because the plant food contained in it is more readily available to crops and because of its better physical condition. But it must be remembered that often one-half or more of both plant food and organic matter in fresh manure are lost in the process of rotting. Hence it is desirable to apply the fresh manure and incorporate it into the soil with least possible delay in order to save all its value. It takes two or three tons of fresh to make one of rotted manure, and the percentage composition of the two may be nearly the same.

One ton of manure will contain plant food worth two to four dollars, besides its humus value. Applied in a rotation of corn, oats, wheat, clover, it may give increased yields worth three to five dollars per ton used. On a depleted soil lacking humus, used for fruit growing, the value of the increase in crop might be much greater.

Most of the valuable effects of manure are obtained by the use of cover-crops. Manure applied at the time of plowing in a cover-crop hastens its decomposition and effect. It is very commonly necessary to use lime in order to get the best results from either manure or cover-crops. One or two tons of lime, with as much or more manure, is likely to be very beneficial. Sugar factory waste lime is very suitable for agricultural use.

At what price the cost of manure becomes prohibitive must be determined by the conditions in each particular case. A starving man might be justified in paying a dollar for a loaf of bread, for which a well-fed person would not give more than ten cents. Two tons of manure per acre on a run-down prune orchard might produce increased crop worth $20, while on a well-kept-up place the same application would produce hardly any noticeable effect.

A recent experiment has demonstrated that sugar cane thrives in the Palo Verde Valley. There is greater profit in cotton growing, however, at present prices.

G. C. Hansman, pomologist in charge of the viticultural investigations of the United States Department of Agriculture, recommends that the wine-grape growers of California graft their vines to currant grapes. He says the currant grape is the earliest to ripen; that they may be dried and put away before the earliest rains in sections where other varieties of raisin grapes ripen too late, and that in the raisin growing sections of this State the currant grapes can be grown as an advance crop and can be cured and stored by the time the other grapes ripen.

FRUIT TREES
WITH A PEDIGREE!

Elmer Bros.' Fruit Trees are not the result of hit or miss propagation methods—but are the products of the most scientific nursery care possible. The roots are strong and thrifty—and the scions are all taken from mature trees of proven productiveness.

The Kind It Pays to Plant

We are practical orchardists as well as nurserymen—and our Santa Clara Valley orchards are among the finest to be found in the entire State. Write to us about your fruit-growing problems. We're always glad to help growers with any suggestions we can make. SEND FOR OUR NEW PRICE LIST.

GIANT FARM POWDERS
STUMPING — AGRICULTURAL

"Better Farming" is all that the name implies. It tells you how to do a hundred and one farm jobs cheaper, quicker, easier and better.

This pocket farm library is published by a company with more than a half a century of experience in making explosives especially to meet western agricultural conditions. You should know the low cost and thorough methods by which they have cleared western land and boosted yields of crops and fruits. Whether you blast or not, you need these 52 pages, fully illustrated, of modern, improved farm methods.

"Better Farming" is sent you free of charge, postpaid. For the price of a postage stamp you get something it has cost us thousands of dollars to prepare. Merely fill in and mail this coupon, or send postal mentioning this paper. Write now.

THE SELF-OILING WINDMILL
has become so popular in its first three years that thousands have been called for to replace, on their old towers, other makes of mills, and to replace, at small cost, the gearing of the earlier Aermotors, making them self-oiling. Its enclosed motor keeps in the oil and keeps out dust and rain. The Splash Oiling System constantly floods every bearing with oil preventing wear and enabling the mill to pump in the lightest breeze. The oil supply is renewed once a year. Double Gears are used, each carrying half the load

We make Gasoline Engines, Pumps, Tanks, Water Supply Goods and Steel Frame Saws.

Effective Treatment of Wood Rot

[Written for Pacific Rural Press.]

SOME YEARS AGO, when asphaltum was first recommended for use where large cuts were made on trees, the writer was repeatedly asked how to apply it, because of the difficulty in keeping it warm and because it was so destructive to brushes. The best method of carrying it around in the orchard is to use a tin can with holes punched in the side, as a heater. Charcoal can be used as fuel and a little sand or ashes placed at the bottom of the heater to prevent it from burning through. The operator can carry a little extra charcoal with him to replenish the fire. This is better than using a lamp, as it is safer. The pot of asphaltum, which sets inside, will, of course, need a separate handle like a glue pot. If you only want a small quantity of asphaltum, the hardware dealer will probably ask you to help yourself, as it has to be chopped out of the barrel in chunks, and, being so cheap, it is unprofitable to sell in small quantities.

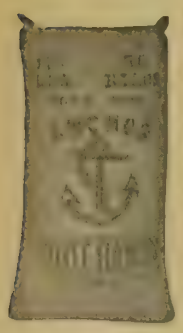
A Unique and Convenient Applicator.

A farmer suggested the following method to get over the brush difficulty and it is now being widely used: Cut up a lot of baling rope into 14-inch lengths. Then tie them up in a bundle to the thickness of one and a half inches. This bundle of ropes should be wound with string tightly, at intervals of one inch, from top to bottom, only one end being frayed out to form a brush. As fast as this end burns off, one of the strings can be cut to give renewed length to the frayed end. This beats paying out 40 cents a day for a new brush and is not so exasperating. The grower who originated this simple little contrivance is too modest to allow his name to appear, but it is worth passing on.

Reason for Protection.

Asphaltum, though difficult to apply, is the most satisfactory because it lasts indefinitely, warms up in summer and becomes hard and glazed in the cold weather, but it never checks. Paint does check and it is in those tiny checks that the fungus spores enter. Once they get in and well down the limb or trunk, it is practically impossible to do anything to check their destructive work. The tree or limb looks sound enough from the outside, but becomes, in course of time, a shell with a spongy center. It is only through a cut or wound of any kind that this fungus can enter a living tree, and that is the reason such pains are taken to make clean cuts and to seal them against infection. A wound made by plow or cultivator or from sunburn should equally be cleaned and treated. More and more care is being taken each year by growers in their treatment of these things, for it means more years of profit on a large investment and it is an important part of the business. An unprotected orchard may be old at fifteen years. One whose cuts have been well cared for may be young and vigorous at thirty.

SULPHUR



It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards 6 times they will not be affected by MILDEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of Sulphur, also EAGLE Brand, Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphurs that money can buy; the best for vineyards; the best for bleaching purposes, LEAVING NO ASH.

Try our new brand of VENTILATED Sublimed Sulphur, 100 per cent pure, for making Paste —(Atomic Sulphur) and for Dusting.

For Lime Sulphur Solution, use our DIAMOND S Brand Refined Flour Sulphur. We can furnish you this sulphur at such low price that it will pay you to mix your own solution.

What Co-operation Has Done for Raisins

(Continued from first page.)

pany constitutes the life of the industry and should have the unswerving and loyal support of every man that raises raisins.

SPECULATIVE ELEMENT ELIMINATED.

Do we have to ask anyone's permission to be allowed to market the products we raise? Our prices are regulated by supply and demand. If they are placed too high, we throttle the industry by inducing over-production and reducing consumption. If prices are too low, the industry is beggared. We have created new markets and extended old ones by the expenditure of our good money and efforts. It is only by loyalty to the association that these assets can be kept in our own hands. To hand all this back to the independent packers is to return to old conditions—to hand over the crops to be exploited by shrewd men whose interest is obviously to make money for themselves. Under present conditions, jobbers, wholesalers and retailers know where they stand. They can do a legitimate business. Do they or the growers want the gambling element back? The board of directors of the Associated Raisin Company is in the nature of a board of trustees handling the affairs of its members.

WHAT IS A TRUST?

A trust is an undertaking on the part of an individual or corporation to administer an estate or negotiate business to the best advantage of the trustors. It is understood that the trustee or trustees pledge his or their honor to consummate any business they undertake to the best advantage of those whom they serve, regardless of their own interests. In a word, it implies confidence of a high order. Is it not true that this word has been debased in the meaning it has conveyed to the American mind these many years? The word "trust" means this to the man in the street: Either by deed or understanding, the unification of large interests in order to exploit the producer or the consumer or both, and not to protect or to assist him; to make more money for the few by handling the business of the many; to squeeze down to the last penny the amount paid to the producer and to mulct the consumer in all the traffic will bear, and then apply the difference to their own private bank accounts. That is the meaning the word "trust" had and still has to the majority of Americans in spite of the cleaning up effected by the Sherman anti-trust law—a trust with a very small "t."

RELATION OF GROWERS TO THE ASSOCIATION.

If we are going to market our own wares, it is very clear that we can only do it by co-operation—one brand, one administrative and office force, one packing standard and department. It is only in this manner that advertising, standardization and inspection can be carried out. By the loyalty of the growers themselves in allowing their money to remain in the association treasury when the establishment was just starting, the association became an entity. Since then it has got firmly on its feet and owns and controls about thirty-eight packing plants in the State. To relieve the congestion incident to increased production, at their local plants the Associated has erected a central manufacturing plant at Fresno at a cost of some $300,-

(Concluded on page 403.)

They're in to Win

Fair targets, every one of these men, for the German riflemen and machine gunners hidden behind the parapet.

But they are not thinking of the bullets whizzing past them; of the shells bursting over their heads.

They are intent on one thing—to scale that bank, take the bridge head and ***win the day.***

And these men are made of the same stuff as all true Americans who read these words.

If we are the same stuff, let us prove it. Let us get into the fight as they do—to the limit—for Victory!

Here and There in the Fruit Business

[Written for Pacific Rural Press.]

Fruit First to Suffer from Drouth.

Dr. J. C. Whitten of the University of California gives the following interesting facts that it is important every orchardist should know: "It has been found that in a dry time the fruit is the first part of the tree to suffer from lack of water. This is because when water supply is inadequate the leaves have the power of drawing water out of the adjacent fruits. The sap in the leaves is more concentrated than that in green fruit, so the sap of the leaves draws water from the apples. This point can be tested by cutting off two branches from an apple tree, each containing a similar number of fruit and leaves. Hang them up in a dry place, pick all the apples off one of the limbs. The leaves on the branch having no apples to supply water will turn brown, dry and brittle within 24 hours. The leaves on the branch containing apples will keep green for days until the water is drawn from the apples and the latter are dried and shriveled. In a similar way cucumber or melon vines, containing large watery fruits, have their leaves remain green until the cucumber or melon is entirely shriveled, while a similar vine containing no fruit will have the leaves begin to wilt as soon as the vine is cut off."

Fruit Growers' Convention to Be Held.

At Riverside this time, from November 13 to 15, inclusive. It is expected that the attendance will be large, not only because of conditions due to the war but also because many problems have arisen owing to recent dry seasons and peculiar weather conditions. These various problems will be discussed at the meeting. Plans for the coming year will be one of the main features of horticultural week. To the business growers this convention is one of the "events" of the year, because its purpose is to promote and further the horticultural and viticultural industries in all their phases. The open discussions generally have enough "dynamite" in them to hold everyone's interest and provide new viewpoints.

Table and Raisin Grapes on Zinfandel.

F. H. Wilson, president of the California Peach Growers' Association, has a vineyard that has been worked over and is a great success. It was formerly Zinfandel, and we saw ten acres that had been grafted to Emperors bearing an estimated crop of seven tons to the acre. Ten acres that were grafted over to Sultanas bore two tons of dried fruit to the acre. There were also 20 acres grafted to Almeria, which gave a return last year of $700 an acre gross. The grafts are three to four years old. Like the seedless, this grape needs long pruning, and the fact that they ripen late and are good shippers and keepers probably accounts for the high price obtained.

Prunes on Almond.

Prunes on almond roots are said by John Vallance to be rather larger than on any other stock. Mr. Vallance, who has a 20-acre orchard of fine young prunes and almonds on the Almaden Road, near San Jose, also says that the skin of these prunes seems thinner, so that it is necessary to use less lye in dipping. The objections to this root on heavy or poorly drained soil are that the feeding roots not only do not thrive but decay and the larger roots are inclined to grow. On almond soil the almond is a good stock for prunes.

Apple Inspection.

Inspection under the Standard Apple Act of 1917 is gradually being extended as funds for the work accumulate. Eventually it is contemplated that, in addition to work in the larger cities, efforts will be made to carry on a "clean up" campaign for the smaller markets. The results of inspection so far have been far-reaching and the work is gradually becoming so systematized that uniform practices and results will be attained.

New Assistant Secretary.

B. A. Reynolds, who was for many years assistant editor, Bureau of Entomology, U. S. Department of Agriculture, has just been appointed to the position of assistant secretary in the State Commission of Horticulture. A valuable addition to the staff.

Rain Benefit to Olives at Palermo.

The wet weather, up to the present, proved of benefit to olives and oranges, as reported by A. E. Richardson of Palermo. The setting of both these fruits was very light this year, but the fruit now appears to be gaining in size.

Don't Neglect the Vaseline.

A little vaseline or any grease or oil smeared onto the cultivator points and plow shares will save lots of time next spring.

Treatment for Crown Gall and Root Knot

[Written for Pacific Rural Press.]

Where trees have been in poor, unthrifty condition in spite of good culture, it is always well to dig down and try to find the cause. If it is a deep-working gopher, he may be caught before the tree has been circled, and bridge grafting may help repair the injury. If a peach-root borer, his ravages may be checked. It may be oak-root fungus and the bi-sulphide isolation can be tried, though no treatment yet used is guaranteed.

TREATMENT OF CROWN GALL.

Poor drainage, stiff clay and alkali may either of them be responsible, included under the generic term of "poor soil conditions," behind which the busy man takes cover. But it is very commonly a root knot or crown gall. This woody tumor, if left to itself, will, in course of time, encircle the tree or root and, shutting off circulation, the tree sickens and dies. This is often cured by carefully cutting out all the morbid growth, right back to clean, sound bark, and then giving the wound a good sousing of Bordeaux mixture, afterwards covering it with Bordeaux paste. Later the wound can be covered with asphaltum and should heal over. D. L. Reed of Reedley told the writer that some of his crown galls were being reduced on peach trees by being thoroughly sprayed under high pressure with lime-sulphur solution, but the best way to get rid of it is the cutting and disinfecting process. All chips and cuttings have to be carefully gathered up and burned, as it is a mass of bacteria which continues infection of the ground and the tumor is likely to recur.

SCRUTINIZE TREES AT PLANTING.

It is most important that everyone planting trees should examine the roots and union of each tree as it is planted. It is practically impossible to detect each one of these in inspection, but the man who is handling them one by one at planting time can give each tree a very close scrutiny. He has to in trimming up the roots anyway. To plant a tree with a root knot on means not only disappointment in the loss of the tree, sooner or later, but also the ground may become infected sufficiently to knot the newly planted clean tree.

The Winchester pattern. 320 pellets out of a possible 431, or 74% of the shot charge, evenly distributed, no birds get through

A quick eye and a good shot pattern

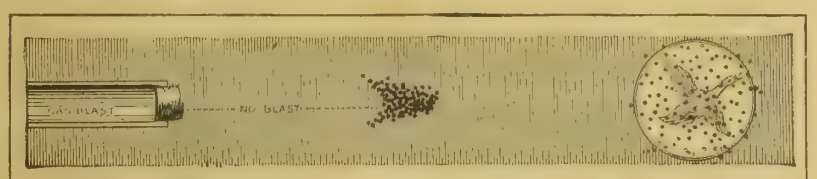
A QUICK eye and a good shot pattern, that's the game-getting combination. Given an old-timer with a reliable gun in his hand and the rest of the story is up to the shot pattern.

Now the secret of good patterns is in the control of the gas blast from the exploding powder. This in turn depends upon the *wadding* in the shell.

The wadding, like the piston head of a gas engine, must give the explosion something solid to work against so that the shot may be *pushed* out evenly.

It must expand and fill the tube of the barrel, completely sealing in the gas behind it. No gas must escape to scatter the shot.

It must offer just the right amount of resistance to the explosion so as to develop uniform pressure and high velocity without danger of jamming the pellets out of shape at the "choke" or muzzle constriction.



The Winchester system of wadding. The wadding expands evenly, sealing in the gas blast all the way to the muzzle, where it is checked by the "choke" or constriction. The shot cluster travels on ahead unbroken. Actual test target 320 pellets out of 431, or 74% of the shot charge (1¼ oz. of 7½ chilled) inside a 30-inch circle at 40 yds.

The Winchester System

Winchester Wadding is the result of repeated experiments to determine the most efficient control of the gas blast.

The special construction of the *Base Wad* gives what is known as *Progressive Combustion* to the powder charge.

Combustion spreads instantly through the powder charge. By the time the top grains of powder become ignited the *full* energy of the burning powder behind is at work. Though the explosion is almost instantaneous, it is none the less *progressive*, the final energy and maximum *velocity* of the completely burned powder being developed at the *muzzle* where it is most needed.

Meanwhile, under the heat and pressure of combustion, the tough, springy *Driving Wad* has expanded to fill the barrel snugly all around. No gas escapes. It is completely sealed in. The wadding *pushes* the shot evenly.

At the muzzle, the shot pellets slip out without jamming, while the wadding is checked for a brief interval by the constriction of the muzzle. *It follows some distance behind the shot pattern.*

The shot cluster travels on unbroken by gas blast or wadding and makes the hard-hitting, uniform pattern for which Winchester shot shells are world famous.

Fish Tail Flash. All Winchester smokeless shells are made with the new Winchester Primer—the quickest and most powerful shot shell primer made. Its broad *fish tail* flash gives even and thorough ignition. Every grain of powder is completely burned up before the shot charge leaves the muzzle.

The Crimp. The required degree of pressure necessary in seating the driving wads is worked out in combination with the *hardness* or the *softness* of the *crimping* required for any particular shell.

Waterproofing and Lubrication. In the cold, damp air of the marshes, or under the blazing sun at the traps, Winchester shells will always play true. Winchester waterproofing process prevents them from swelling from dampness. Special lubrication of the paper fibres prevents brittleness and splitting in dry weather.

Uniform Shells. From primer to crimp, Winchester shells are constructed to insure the maximum pattern possible from any load and under all conditions. $100,000 is spent annually in the inspection and testing of finished shot shells. 25,000,000 rounds of ammunition are fired every year in testing guns and ammunition.

Clean hits and more of them

To insure more hits and cleaner hits in the field or at the traps be sure your shells are Winchester Leader and Repeater for Smokeless; Nublack and New Rival for Black Powder. Write for our Free Booklet on Shells. D. Y-21 **Winchester Repeating Arms Co., New Haven, Conn., U. S. A.**

WINCHESTER

World Standard Guns and Ammunition

Overcoming Smut Ravage in Wheat Fields

Written for Pacific Rural Press by W. W. Mackie

STINKING smut of wheat still takes a heavy toll from the California harvest. Dry years do not reduce the ravages of smut. Control rests in the hands of the farmers. Careful estimates based upon actual counts of heads of smutted wheat in the field show losses varying from 0 to 90 per cent with a general average close to 10 per cent. Little more than 5 per cent of the wheat certificates passing through the U. S. Food Administration Grain Corporation standardization office at San Francisco show no dockage for smut. These dockages, varying from ⅛ to 10 per cent, represent only a small portion of the actual loss, because the quantity of smut found in a threshed sample of grain represents but a small fraction of the actual amount found in the standing grain. During the process of harvesting and placing the grain in the sack, the greater portion of the smut balls are reduced to powder and blown into the air to be showered upon the surrounding lands. There they lie awaiting the planting of the seed wheat.

HOW SMUT GROWS.

Generally the planted wheat seed and the smut spores find the climatic conditions favorable for simultaneous germination. On germination the smut spore at once sends out a thread which pierces the wheat seedling at the growing point of the sprout, or plumule, before it emerges from the soil. After the point of the seedling has passed out of the soil, the smut thread can no longer gain entrance to the plant. When the spores are held in large numbers on the brush end of the kernel, the distance from the growing point of the sprouting seed is so short that the thread from the sprouting smut spore almost immediately comes in contact with the sprouting seedling, thus gaining entrance to the wheat plant. Having once entered the plant, the smut fungus continues to grow and develop with it. When the kernels of wheat in the maturing head begin to fill with starch, the fungus fruits or goes to seed, forming a mass of black spores while consuming the entire starch contents of the kernel. Usually every head on the plant is smutted.

As every smut-filled kernel, or gall, contains over five million smut spores, it is readily seen how easy it is to infect wheat when the smut galls are ground to powder in the thresher and large numbers of them become firmly entangled in the brush at the end of each kernel.

BLUESTONE BEST FOR CALIFORNIA.

As the spores of stinking smut of wheat are never found inside the seed coat, but are always attached to the outside of the kernel, the destruction of these spores by the use of proper fungicides is a simple matter. Two well-known fungicides have long been used—bluestone, or copper sulphate, and formaldehyde. Bluestone, or blue vitriol, as it is frequently called, has been in use for smut eradication for a much longer period than formaldehyde, which first came into use through the researches of Dr. H. L. Bolley of the North Dakota Experiment Station. On account of the cheapness and ease of applying formaldehyde, it rapidly supplanted the use of bluestone in the States east of the Rocky Mountains. The results from the use of formaldehyde for smut eradication were not so pronounced and satisfactory on the Pacific Coast. East of the Rocky Mountains summer rains continually moisten the spores when the summer temperatures are too high to cause the smut spores to germinate. Stinking smut spores will not germinate at a temperature of 65 degrees Fahrenheit or greater. Being unable to germinate, smut spores fall a prey to moulds and ferments which entirely destroy all spores left in the fields. On the Pacific Coast this is not the case, for here our long dry summers do not favor fungous growths. When the fall rains begin the temperature favors the growth of the spores of stinking smut and does not favor its enemies.

Soil retaining live spores of stinking smut is said to be infected. Because of the effectiveness of bluestone against soil infection, it has been retained by the majority of wheat farmers on the Pacific Coast. The reason why bluestone is effective against soil infection while formaldehyde is not, is seen in the different behavior of the two chemicals. Formaldehyde is a concentration of gas which is held by water to approximately 37 per cent. As soon as the wheat seed is dried after being dipped in a formaldehyde solution diluted to a strength of one pint to forty gallons of water, the formaldehyde gas evaporates, leaving no residue to destroy the threads of the smut fungus which germinate in the soil. Bluestone, on the contrary, leaves a coating of bluestone crystals over the dried surface of the seed. When seed treated with bluestone is sown in moist soil, or when it is moistened by rain, the bluestone goes into solution. The action of the bluestone solution is destructive and repellant to the smut threads growing in the soil.

LIME NEEDED AFTER BLUESTONE.

Recent experiments conducted at Berkeley with treated wheat seed to demonstrate the effect of bluestone in preventing soil infection gave a percentage of 4 per cent of smutted plants for bluestone and slightly less for the bluestone-lime-treated seed as against 50 per cent for the untreated seed. Formaldehyde has no residual effect against soil infection. Where there was no soil infection, no smutted wheat occurred for either formaldehyde or bluestone. Both are completely effective in killing smut spores when used according to the proper strengths.

Both bluestone and formaldehydo have a destructive action on the germ of seed wheat when not properly handled. It has been found that formaldehyde-treattd wheat seed not well dried when stored for a week or more before planting will give very low germination and sometimes no germination at all. When formaldehyde-treated seed is sown within 48 hours after dipping, the germination is excellent. If the seed to be stored is very thoroughly dried, little or no damage results. It should be dried to the normal water content it had before dipping, and this is frequently impossible during the wet, rainy season. Bluestone may also be very destructive to seed. When used at the rate of 1 pound to 4 or 5 gallons of water, bluestone has been found by hundreds of germination tests to kill an average of 60 per cent of the seed wheat, and dilute solutions do not kill all the smut spores. Bluestoned wheat, if dipped in a solution of quicklime (1 pound to 8 gallons of water), within fifteen minutes shows almost no loss in seed germination. A much more rapid and normal root and plumule development is secured.

Formaldehyde may be successfully and cheaply used where there is no infection.

BLUESTONE-LIME SOLUTION.

Copper sulphate, 1 pound, dissolved in 4 gallons of water; quicklime, 1 pound, slaked in 8 gallons of water; dip seed in bluestone solution 3 to 5 minutes, shaking out air; drain 15 minutes, then dip in lime solution 5 minutes; if the lime solution becomes blue, replenish with new solution. Dry thoroughly before storing.

FORMALDEHYDE SOLUTION.

Formaldehyde (U. S. P. 37 per cent), 1 pint to 40 gallons of water; dip sacks or butts of seeds 10 minutes, shaking out air; cover with sacks or canvas 2 to 8 hours, ventilate thoroughly and dry. Sow within 48 hours.

Reduction in Iron for Tractors and Implements Ordered

[Written for Pacific Rural Press.]

A 25% reduction in iron and steel to be supplied to manufacturers of tractors and farm implements during the year October 1, 1918, to October 1, 1919, has been ordered by Priorities Commissioner E. B. Parker at Washington. This means that if you want a new tractor or implements, you will have to order early. Estimates of the Government requirements for the current six months have been gradually increasing from 20,000,000 tons to 25,000,000 tons, largely due to the increased vigor with which the campaign is being pushed. To get the extra 5,000,000 tons, the War Industries Board is trying to check other steel consumption as much as possible. The reduction on agricultural implements is expected to release 500,000 tons of iron and steel for war purposes. The Board urges that a full stock of repair parts be supplied to farmers, thereby aiding in keeping machines now on the farms in continuous use and preventing, if possible, an actual shortage of implements. The situation may be eased by use of whatever stocks of steel the manufacturers now have on hand. However, about 40,000 questionnaires asking how much steel is in stock have recently been sent out to as many manufacturers of all kinds by the Census Bureau, with the understanding that any attempt to conceal stocks would be drastically punished. While it was said there is no intention of commandeering any stocks at present, that necessity may develop. The first American field army used 40,000 motor trucks, and further purchases of motor trucks alone, as contemplated by the Government, will require between 300,000 and 400,000 tons of iron and steel. At this, motor trucks are but a small incident in the total demand for iron and steel, which is mostly used for ships, guns, and shells. Prices on iron ore for the last quarter of 1918 were advanced 25 cents per ton October 1, and prices on basic and foundry pig iron were advanced $1 per ton. Now, if you want tractors or implements, order early!

SOUTHERN CALIFORNIA SHIPPING VEGETABLES.

[Written for Pacific Rural Press.]

Accurate data on vegetable shipments for the season closing September 1 are not available, but the following comments on various crops, based on information supplied by H. S. Hazeltine of the California Vegetable Union and H. H. Warner of the Los Angeles office of the U. S. Bureau of Markets, will be interesting.

Cauliflower planting, which starts in mid-July, is just being finished, and the acreage will be lighter in Southern California than last year. Orientals and foreigners will probably have the same acreage as last year and one American cauliflower specialist near Los Angeles will have the same. But in a district around Compton a group of rather inexperienced white growers formed an association last season and planted extensively. Due to various reasons, including slow freight and poor growing conditions, they had a disastrous marketing season, which wound up with an assessment, and they will not grow cauliflower this year.

The cabbage market started high last season and ended low, but average returns were good, and about the usual amount of seed was bought this year. Transplanting season is at hand.

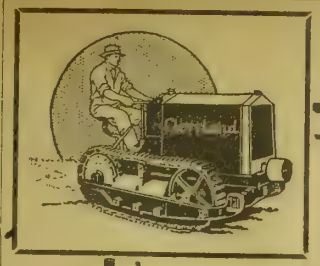
About 2500 acres of celery are maturing in California as against 4000 acres last year. Only about 643 acres are growing in Southern California. The specialized district around Smeltzer, in Orange county, where formerly 700 to 800 acres were grown, has turned to other crops on account of a few seasons of loss by fungus disease, which lives over in the soil and can only be killed out by rotation of crops. The shortage of help and poor transportation of last winter's crop are held responsible for the short total acreage. The crop is in fine condition and shipments will commence about October 20.

Spring-crop potatoes in Southern California found very satisfactory markets despite some disappointment in quality. There was considerable tuber moth infestation and the disease, "net necrosis," appeared for the first time seriously in the Nuevo district of Riverside county. The acreage was large, but the total yield light, largely on account of climatic conditions. It is expected that United States potato grades will be enforced on the fall crop, as they are in most potato growing districts of the United States, but as they were not on the spring crop in Southern California. These grades provide for two sizes and a minimum percentage of various defects. Planting in late July and August for the fall crop was unusually heavy.

The past lettuce season was not very satisfactory because much of it was too long on the road and arrived in bad condition. A blockade came while the Imperial Valley crop was being shipped. Los Angeles is one of the principal districts. Here the planting and harvest go on the year around and the acreage is about as usual. In Imperial Valley planting commences about October 1.

NO LUCK IN POISONING JACK RABBITS.

To the Editor: Early in July I planted four acres to casabas and as soon as the plants got fairly started the jack rabbits commenced a systematic harvest. I used a strong solution of blackleaf 40 and whale-oil soap and sprayed one acre of the four, with the result that the jack rabbits entirely cleaned up the one acre sprayed, also consuming a quarter of a pound of arsenic of lead and copper that I put out in sweetened bran. They are still chewing at my other three acres of casabas, but not with the relish they displayed in disposing of the acre I had sprayed with fish-oil and tobacco juice. Now are jack rabbits consumers of fish and tobacco? I am contemplating the use of wine and beer for my guests. I found no dead rabbits from the sweetened bran poison.—M. M., Turlock.



Are Farms Going to Pay this Year—

HELP IS GETTING SCARCE—THERE ARE NOT ENOUGH MEN OR WOMEN TO GO AROUND AND HUNDREDS OF ACRES WILL NOT BE WORKED THIS YEAR.

THE CLEVELAND TRACTOR WILL HELP OUT, DOING THE WORK OF THREE 3-HORSE TEAMS, WITH ONE MAN TAKING THE PLACE OF FOUR.

BUT THE BUILDING OF TRACTORS HAS BEEN REDUCED 25 PER CENT BY THE WAR INDUSTRIES BOARD.

Take Warning

Read the message from the Government in the opposite column. Read every word. Let it sink in.

It means just this—that there will be a shortage of tractors for the next twelve months at a time when the demand will exceed all previous records; when labor and horses are almost impossible to secure.

It means that the man who "puts off" will not secure a tractor.

It means that the man who will not heed the storm signals will be shipwrecked.

It means the line is to be drawn between those who think and those who don't.

Tomorrow never comes nor can you turn back to yesterday; you have but today to decide.

This is a personal message for your personal good. It is to men, real men, men who can grasp the truth; men who, when they hear the truth, ACT.

F. H. STOW.

Here is what the Message says concerning Tractors:—

After a very full and lengthy discussion of the needs of the Government in steel and pig iron, also the necessity of maintaining an adequate supply of farm operating equipment, including tractors, for food production, E. B. Parker, Priorities Commissioner, says that the very least they could ask this industry to contribute to help meet the Government war program was a reduction of 25 per cent in the amount of pig iron and steel to be received from the suppliers for the coming year, from October 1, 1918, as compared with the quantities received during the previous year, October 1, 1917, to October 1, 1918. No amount of argument could change this decision and it therefore becomes the obligation of each manufacturer to adjust himself in the way that will serve his trade and the farmer best out of the materials allotted him as above.

Seasonal Review of Sugar Beet Situation

[Written for Pacific Rural Press by R. E. Hodges.]

The sugar beet crop of the United States for 1918 is estimated by the Federal Food Board at 6,359,000 tons, an increase of 6.3 per cent over last year, but a decrease from the ten-year average just when a notable increase is badly needed. The estimate for Colorado is 1,490,000 tons, as against 1,857,649 in 1917. California, which produced 27 per cent of the American supply last year, shows a decrease from 1,331,548 tons in 1917 to an estimated 1,041,000 tons in 1918. Michigan, Utah, and Ohio have increased to 992,000 tons, 1,035,000 tons, and 320,000 tons respectively. However badly sugar is needed, the Food Administration is not urging growers to plant beets under contracts that will not bring reasonable profit while manufacturers are making big profits. The Government has no power to guarantee the refiners a price for next year's sugar and no authority over sugar beet contracts. The Administration believes, however, that next year's sugar prices will be such as to justify better contracts than most of them offered last season. Some factories this year operated at a low margin or actual loss on account of factors mentioned below, but some made high profits, part of which are taken in the excess profits tax.

There was such difficulty last spring for California growers and manufacturers to arrange contracts that the acreage was slim in almost every district this year; and due to one cause or another, most districts have had a light yield per acre. At Spreckels, near Salinas, the season's run for 70 to 75 per cent of the usual output would have started September 16 had not the rain prevented. Some few beets were already dug in the Salinas Valley and some tests had shown 17 and 18 per cent sugar. A few that were not ripe benefited from the rain, but most of them were mature and a considerable loss of sugar is being experienced due to second growth. In Arroyo Grande Valley, in San Luis Obispo county, a pretty fair crop of beets was being pulled in mid-September for the Betteravia factory operated by the Union Sugar Co. They were just starting the factory for an expected run of about 80,000 tons of beets from 6500 acres of the Santa Maria Valley and some from nearby districts. Beans had stolen a chunk of the beet acreage and the seasonal conditions had reduced the crop below normal. Lompoc Valley produced about 1000 acres planted by the Betteravia people.

The American Beet Sugar Co. at Oxnard had not been hurt by the rain. According to Agricultural Superintendent G. E. Bensel, the Oxnard district had 8000 acres averaging 8½ tons per acre and testing about 20 per cent sugar. This is about a 20 per cent reduction in acreage, worse than that in yield per acre, and about 1 per cent lower than the average sugar percentage. Some of the beets went considerably higher in sugar. The factory began operating late in August. Labor proved scarce and only 1700 to 1800 tons per day could be brought in, whereas their capacity is over 3000 tons per day. They expected to be operating until mid-October. Mexican labor had been imported and neat dwellings provided, but still they worked slow. Of six other factories in Southern California, all except the one at Chino had a run, but it was short, the acreage was short, the yield per acre under normal, and the sugar content low. The labor situation was worse than last year and it was impossible to get the laborers to chop leaves off without wasting a great chunk of the crowns. The season was bad for any soil and especially for the considerable acreage on which, with ordinary rains, alkali can usually be held down until the plants have a good start. With a good start they can usually stand considerable alkali, but the rains were such last winter that the seedlings could not get ahead of the alkali.

The San Joaquin Valley Sugar Co., drawing beets from Bakersfield, Corcoran, Alpaugh, and Visalia, had a good acreage and a good total yield of sugar, finishing their run in September as usual. Acreage in the Visalia district was light and growers aimed to contract not a great deal more than they could handle themselves with a little outside help. The company planted about 700 acres near Visalia.

In the Manteca district, according to S. E. Miller, manager for the Manteca plant of the Spreckels Sugar Co., the acreage was about 4700, as against 5000 the previous year. The crop was nearly a failure due to the late start and sudden stop of rain last winter and the dry year previous, which lowered the water-table on which most growers depend for sub-irrigation. Insects, including beet leaf hoppers and garden nema-

The Homer Laughlin Engineers Corporation
2652 Long Beach Ave. **Los Angeles, Cal.**

todes, destroyed the crop in some fields and reduced the crop seriously in others. Mr. Miller estimates the average yield for all plantings in this district at only three or four tons per acre. The sugar content was good, about 17 per cent. One tract near Stockton, very well adapted to beets, averaged 19 or 20 per cent before the rain, but the beets took a second growth and lost several percents of sweetness. In the Tracy district the Pacific Sugar Corporation grew its own beet crop on somewhat over 5000 acres, and while the yield was not up to normal there is every reason to expect a larger acreage, grown under contracts with local farmers in the coming season, since an efficient irrigation system has been installed this summer and the water supply will be dependable.

The Sacramento Valley Sugar Co. plant at Hamilton City had considerably increased acreage in the territory as far south as Grimes, Colusa county, and as far north as Vina, Tehama county, the acreage having been estimated at 6000, of which the company itself grew about one-third.

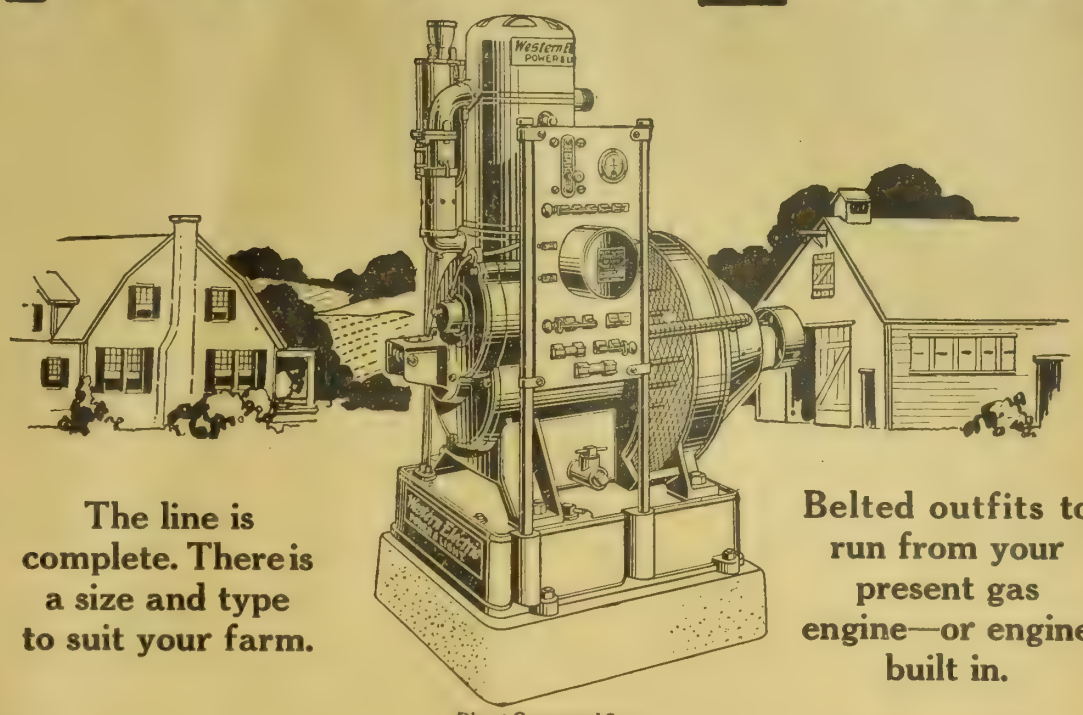
SOUTHERN COAST GRAIN SURVEY.

[Written for Pacific Rural Press.]

While the region about Salinas was formerly a great wheat country, almost none of this grain is now grown here, largely, as farmers tell us, because of a blight that lets the kernels get almost to the dough stage, when in three or four days it travels from the tips downward an inch or two, turning the heads light yellow, shriveling the grain, and soon taking the entire heads if the grain is not cut for hay. The wheat grows rank and tall, with heavy heads, on the lower lands. Chevalier barley is popular, having made 3000 sacks on 100 acres for one man this season and was in the warehouse before the rain. A great deal of grain on the lowlands, however, was lying on the ground in bundles during the rain, with the fields too miry to get it out. Practically no market movement is yet noted. The Salinas Land Co., near King City, made over 30 sacks of barley per acre on one piece, but both wheat and barley averaged about eight sacks on about 3000 acres last season. In northern San Luis Obispo county E. J. Wickstrom of the San Miguel Milling Co. surveys the situation thus: The wheat crop averaged not over three sacks as against seven or eight sacks normal yield. Wheat is more common than barley, as rust seldom afflicts it and prices are stable. But this year a lot of it never got out of the boot on account of drouth. Early Baart, Bluestem, and Propo are the hard wheats here, but Sonora is the favorite because it stands drouth best. Barley averages 12 to 20 sacks per acre. Martin & Cousins of Paso Robles estimate that the grain acreage was about three-fifths wheat and two-fifths barley, with about 55 per cent of a normal yield. Much of the wheat, badly mixed with black oats, was cut for hay because it wouldn't make grain anyway. Wheat has proved somewhat difficult to sell, as the mills were not allowed to buy more than a 60-day supply and growers shipping to the Grain Corporation had to wait three or four weeks for their money. There seems to be a shortage of good barley here, as much of the crop was of poor shoepeg quality. In the hills surrounding Arroyo Grande Valley grain was practically all cut for hay. In the Santa Maria Valley of Santa Barbara county not over 15,000 bags of barley and 4000 bags of wheat were threshed this season. Lompoc Valley had no grain or hay except on the mesas and that was not enough for their own use.

The Maxwell Rice Company started rice binding on their 2800-acre tract between Colusa and Maxwell. They will use five tractors and 200 men and with favorable weather will complete the harvest in fifty days. They expect to average 45 sacks to the acre.

Western Electric POWER and LIGHT



The line is complete. There is a size and type to suit your farm.

Belted outfits to run from your present gas engine—or engine built in.

Direct-Connected Set

IN buying a plant from the Western Electric Company, you enjoy unusual advantages—all of which help you get just the outfit that you need, at the price you want to pay.

We realize that it is not good business to offer you only one kind of an outfit. That is why you can choose from several kinds of Western Electric plants—and why our advice is impartial.

If you already have a gas, gasoline or steam engine, we can furnish the electrical equipment. If you desire a belt-driven plant with engine that can be used for other purposes, we can supply that kind of a plant also. The direct connected plant illustrated is our newest model. The 3¼-horse power silent engine burns gasoline or kerosene; is throttle governed, air cooled and automatically stops when the batteries are fully charged. The engine can also be used for other power purposes.

To be sure that you get the right plant—right in size and equipment—see the Western Electric man near you. We stand behind him with our forty years manufacturing experience. He can tell you all about Western Electric outfits, motors, water systems, milking machines, irons, vacuum cleaners and other electrical helps for farm and home.

There is a Western Electric man near you. Mail the coupon for Booklet No. PRR-10 and we will tell him to get in touch with you.

Field and Garden Suggestions

[Written for Pacific Rural Press.]

Vetch Seed Scarce.

While vetch seed is showing up in unexpected quarters, the supplies are short in total. A few lots of Oregon seed, shipped to New York last season and held over, are offered for shipment back to our Coast. Oregon, which usually supplies most of the seed, is exporting very little and importing more this season. Seed in California are selling at about 12c to the users. Canadian field peas are being recommended by Morse & Co. to replace vetch, but the price of these is about 8½c, and more should be sown per acre. A mixture might cheapen the cost somewhat. Melilotus indica sells at 10c and is far cheaper per acre than either vetch or peas, but it needs more time for growth in the spring than can be allowed before plowing except where irrigation can keep the soil moisture right until March or April, when the melilotus is about at its greatest growth and profitableness.

Farm Bureau Market Association.

The marketing department for auctioning of hogs and miscellaneous goods is now definitely organized and officered under the Kern County Farm Bureau, according to Farm Adviser Myron A. Rice. H. G. Hull is chairman of the marketing department and D. H. Bitner is its business manager. Local managers help at Wasco and McFarland, where stock scales are maintained. Scales and regular auctions are also planned for Bakersfield. Poisoned barley is sold and field crop seeds are bought wholesale through this department for members. Marketing committees from Tulare and Kings counties are uniting with Kern county in organization of the "California Farm Bureau Marketing Association."

Madera County Grain.

Grain is being sown now on summer fallow in Madera county. Yield of wheat last season on summer fallow was six to eight sacks around Chowchilla, according to Manager E. S. Cardwell of the Chowchilla elevator and warehouses. Barley on fallow yielded around eight sacks, though some crops went up to fifteen. Where grain land was irrigated, the yield varied from 12 to 40 sacks of barley, and one man made 30 sacks of wheat. With irrigation the crops are larger and they are grown every year. Nearly all barley is the common variety and nearly all wheat is Club. The Madera crop was of uniform quality and color.

Are You Planting Weeds?

A sample of alfalfa seed offered to a commercial seed house and tested at their request by the University contained 2430 curled dock seed per pound, 900 goosefoot, 270 canary grass, 90 Napa thistle, 90 small yellow-flowered melilotus, and 90 Hordeum sp., totaling 3870 weed seed per pound. The sample showed 97.61 per cent pure alfalfa seed, 1.34 per cent inert matter, and 1.05 per cent weed seed. In sowing this alfalfa seed at the rate of 20 pounds per acre, 483 weed seeds would be sown on each square rod, as figured out by Prof. J. W. Gilmore.

Sacramento Valley Beans.

Loss of pink beans from San Joaquin county north is indicated as over 50 per sent, many having been killed outright. Those that survived have taken on a second growth, which will delay harvest and increase danger from frost and rain. Large whites have suffered less in yield, and the quality of those harvested is not injured unless they shall be stored containing too much moisture.

Prevent Wheat Smut.

"Prevent smut in wheat by treating seed. Immerse four minutes in bluestone solution made by dissolving one pound bluestone in four gallons of water. Then dip seed in milk of lime made by slacking one pound of quicklime in ten gallons of water." Such is the inscription over a pile of wheat in the Farm Adviser's window at Merced.

Merced Crop Average.

Merced county acreage sown to field crops, as compiled for 1918 by County Assessor A. G. Clough, is given below: Wheat 12,000, oats 15,000, barley 135,000, corn 8000, for hay 13,000, rye 13,000, rice 400, sweet potatoes 4000; onions 100; beans 14,000, tomatoes 250, cantaloupes 600, acres standing alfalfa 100,000.

MEETING OF CALIFORNIA STATE GRANGE.

Ukiah, of Mendocino county, has the honor of entertaining the grangers of California in annual convention this year. The sessions begin Tuesday, October 15, at 11 o'clock a. m., with Frank L. Hunt of Napa in the chair as master of the deliberations of the members, and continue four days.

The officers of the California State Grange come from the six principal "grange counties" of the State and are as follows: Master, F. L. Hunt, Napa; overseer, Roy I. Church, Petaluma; lecturer, Dr. E. C. Abbott, San Jose; steward, Lee Dudgeon, Soledad; assistant steward, A. C. Williams, Visalia; chaplain, Rev. Robt. G. Harbutt, Kenwood; treasurer, Michael Farrell, Mountain View; secretary, Martha L. Gamble, Santa Rosa; gatekeeper, Robert Scholz, Campbell; Ceres, Mrs. Lulu C. Eipperm, Aromas; Pomona, Mrs. Mary L. Church, Saratoga; Flora, Mrs. Ella Brangler, Sacramento; lady assistant steward, Miss Mamie Sanford, Sacramento; pianist, Mrs. Alice Winans, San Jose.

Executive committee: Thomas Jacob, Visalia; Geo. R. Harrison, Sebastopol; A. Van Maren, Fair Oaks.

PRELIMINARY PROGRAM OF SPECIAL FEATURES.

Tuesday, October 15—Formal opening of State Grange at 11 o'clock a. m.; reception to visiting Patrons at 7:30 p. m.

Wednesday, October 16—Address by F. N. Bigelow, secretary State Market Commission, 1:30 p. m.; lecturer's conference at 3 o'clock p. m.; annual meeting of stockholders of Grange Fraternal Fire; Insurance Association at 4 o'clock p. m.

Wednesday evening — Lecturer's hour; memorial exercises and deputies' conference.

Thursday afternoon — Excursion tendered visiting Patrons by local Patrons and citizens of Mendocino county.

Thursday evening—Conferring fifth and sixth degrees, followed by Feast of Pomona.

Friday evening—Closing session.

Other interesting speakers will address the convention.

NO ONE ALFALFA IS BEST

for all moisture and soil conditions

There is only one certain way of securing the kind of alfalfa best adapted to your conditions.

That is by planting one of the

Seven Kinds of

GREEN AND GOLD

Alfalfa Seed

In this way you not only insure yourself a good stand but a long and heavy producing yield.

Let us send you an illustrated booklet describing each kind and its particular adaptations. Also price list on new seed

A Good Piano Is Not Necessarily An Expensive One

Of course we feel that the finest piano is the STEINWAY, but the prices for Steinways, while thoroughly consistent with their high quality, are generally beyond the means of many homes.
For this very reason we have devoted much attention to a group of medium grade pianos—really famous makes—products of old established firms—pianos for which we have been the selling agents for years. In offering such pianos as A. B. Chase, Krakauer, Estey, Krutzmann, Emerson, and Stroud, we can heartily recommend them as ideal for the home or school. The prices of these pianos are within the reach of nearly everybody.
Then we carry the Aldrich at a lower price—a good dependable piano which will give excellent service.
Then again we have on our floors at all times many "used" Pianos (good reliable makes) which we have taken in part payment for Steinways and Pianolas. These have gone through our shops and have been put in first-class condition—and carry our guarantee. We advise a customer to buy a good "used" piano rather than the cheap new ones offered by some dealers—the prices are the same but not the quality.
What ever your purpose or your need, we will serve you to our best ability so that the transaction will be to our mutual and lasting satisfaction. We gladly arrange convenient payment terms.

We invite you to call at any of our stores — or write us asking for illustrated catalogues and prices.

We are dealers in Steinway and other Pianos, Pianola Pianos, Aeolian Player Pianos, Player Music, etc.

Woman's Work ON THE FARM

By George! Wife, They're Right!

Fuller & Johnson Says

"The time has come when farmer's wives are demanding power to help them in their daily tasks — and it is right.

"Their work is important and the farmer himself realizes that it is to his advantage to supply her with some small engine to help her out.

"A Fuller & Johnson FARM PUMP ENGINE has proven itself to be the best adapted for her needs."

CAN BE made much easier and at the same time much more profitable if she has at her command, a reliable, small power pumping plant.

Not only can she relieve you of all the pumping and other round-the-house jobs, but she can do more work with less effort than she uses in doing her present work.

What farmer's wife wouldn't welcome a simple, safe, economical and reliable engine to help her in her daily farm work. It is assistance that is really due her. Get a

FULLER & JOHNSON Farm Pump Engine

for her and you will be surprised at the change it makes all around.

The engine costs but little and takes very little fuel in running. It comes all complete in one crate, ready to run—no extras, belts, braces or special platforms needed. It is very simple, easily understood and perfectly safe to operate. Will not freeze up or overheat. It's an ideal engine for a farmer's wife to have at her command on the farm.

Bring your wife with you and let us show you all about the Fuller & Johnson Farm Pump Engine

Wants Improved Alfalfa Machinery

[Written for Pacific Rural Press.]

To the Editor: I have about 30 acres of alfalfa. It mats so that the mower divider as manufactured now pulls down all along the end of the cut a great deal of alfalfa. To be able to cut that, the horse must be kept off a little way so as not to walk on it, thereby losing part of the sickle cut each time and not doing a good job either. I believe it is possible to put an attachment on the divider high enough to throw back the uncut alfalfa so that on the next round the horse can walk up close to the standing crop.

On the rake the alfalfa gets into the ratchet wheels and prevents dumping quickly, so that by the time the teeth drop you miss a little each time after dumping. To obviate this the driver has to get off constantly to clean the ratchet wheels. My neighbors have the same troubles. I have written the International Harvester Co. at Chicago, but in both cases they say that they have not had enough demand for the simple contrivances that would avoid the difficulties to interest them in the expense of making such improvements. According to this, the company must be approached through an association, numbers being the only thing that will count. I leave it to you.—W. R. Maxwell, Glenn.

[Now then, alfalfa growers! If you want such contrivances to be regularly manufactured for sale, just drop a card to the Pacific Rural Press, stating that you are in the market for anything of that nature that will work to your own satisfaction, and we will present your case as strongly as you respond to this. Meanwhile, alfalfa growers who have overcome these difficulties may help your fellowmen by sending us descriptions of your contrivances.]

Suggestions for Fall Berry Pruning

[Written for Pacific Rural Press.]

It is not often that old canes are cut out as soon as they have finished bearing, as there is generally so much else to do. But now raspberry and blackberry growers are busy at this work so as to get everything burned up and out of the way as early as possible. When suckers have become too abundant, and therefore small, to profitably employ the bushes further they are being taken out.

RASPBERRIES.

With the raspberries, after fruited canes have been removed in winter, canes which have not been pinched back are shortened to the desired length and laterals taken back to 8 inches or more, according to the grower's ideals or the position of the fruit buds on the laterals. The number of canes, four, five or more, must be determined by the vigor of the growth.

BLACKBERRIES.

With blackberries which have been properly pinched back the same treatment of thinning out and shortening of laterals will apply and the sooner this work is done the less likelihood is there of disease or insect pests being perpetuated on the new wood. Not more than four new canes will be left for next season, all others are removed with the old wood.

BERRY PRUNING.

The Mammoth, loganberry, evergreen and Himalaya are all trained on trellis—preferably two wires, so they can be replaced. Cut back to desired length. When laterals get too long, pinch back and repeat.

U. S. TOMATO ACREAGE.

Only two States in America contracted greater acreage of tomatoes to canners for the season of 1918 than California, as shown by a report from the U. S. Bureau of Crop Estimates. Indiana growers contracted 48,339 acres, as reported by 156 factories. Maryland figures are 39,991 acres contracted to 326 factories. California contracted 30,459 acres to 99 factories. Other acreage figures above 10,000 are: Virginia, 20,512; New Jersey, 17,813; and Missouri, 12,239. Total acreage in U. S. reported by 1517 factories equals 232,062 acres in 1918, as against 214,125 reported for 1917 by 1437 factories. Eighty-nine factories were reported idle in 1918.

One hundred and thirty acres of barley averaged 30 sacks per acre for W. H. Rough of Riverside county. The barley averaged 120 pounds per sack. Fifty acres of white and yellow dent corn are expected to yield 70 bushels per acre.

Plant Cover Crops

What a wonderful chance for the planting of early crops—now that the early rains have paved the way. Growers of deciduous fruits simply can't afford to overlook this opportunity.

Don't wait—prepare your seedbeds and get your cover crops in *at once*. It stands to reason that the sooner you start—the heavier your cover crop will be. And—the heavier the cover crop the more nitrogen you will put into your soil—the more fertile it will become—the larger your crop returns will be.

Morse's Melilotus Indica

(Bitter Clover)

is a tested, dependable, *scarified* seed. You can count on it—to a greater extent than many of the other legumes. It has far out-yielded common vetch—and stands the frost better. Again—it is far cheaper than vetch this year.

There's a big supply of Morse's Melilotus Indica waiting for you. Write for prices. Today!

C. C. MORSE & CO.
Seedsmen
731 Front Street San Francisco

Ever use Morse's Pasture Grasses? They thrive well on little moisture—and make good hay and forage. Heavy yielders, too. Ask for prices.

-and Plant NOW!

The Genuine Germain's Hairy Peruvian Alfalfa Seed is Sealed and Stenciled!

Ranchers, dairymen and others who fail to place their orders for Germain's Hairy Peruvian Alfalfa seed at once, will be doomed to disappointment. The supply is extremely limited and the overwhelming demand will soon exhaust our stock.

It is the duty of every rancher to make his acreage produce to the utmost. Why be content with the old types of alfalfa when Germain's Hairy Peruvian will produce twenty percent more tonnage to the acre?

W. E. Alexander of Anaheim, Cal., writes: "Germain's Hairy Peruvian has produced nearly double the yield of the old variety. It has more leaves and less stem."

To obtain the best results buy only Germain's Hairy Peruvian—sold in sealed and stenciled sacks.

When you write mention this magazine

Inoculate seed with FARMOGERM before planting, and obtain a larger, better and earlier yield.

Mechanical Power on the Farm

Users of tractors, engines, pumping plants, motor trucks, automobiles, electric motors, and other mechanical farm power are invited to make this department an exchange of their experiences and troubles.

TRACTOR PUSHES RICE BINDER.

[Written for Pacific Rural Press.]

One of the most unique exhibits at the State Fair and at the same time important from a food saving standpoint was the rice binder to be pushed by an Avery tractor. In rice culture, by far the cheapest system of checking for irrigation is on contours which make the borders of utmost irregularity, curving hither and thither and often two sides of a check running close together. As the borders must be abrupt sided and about two feet high to hold the water through summer time, it is impracticable at harvest to run over them. The first swath in each check necessarily involves the rolling down of all the rice for the width of the bull wheel of the binder, which is about a foot. It is generally conceded that the three horses pulling a binder tramp and thresh out the equivalent of another foot wide. As the rice land is generally muddy at harvest, about two feet of the first swath is often lost beyond recovery. Rice growers generally consider that the first swath includes about one-seventh of the rice in an average check. As the swath is six feet wide, one-third of one-seventh of all the rice in each check is lost by common methods of harvesting. It is here that Walter W. Brown of Chico makes a startling proposition, which is more startling when you figure out what it means. He offers to cut the first swath of every check, furnishing the binder twine and deliver to the owner just as much rice as he would get anyway, with the advantage of having it cut and bound free of charge, with the twine furnished. Mr. Brown gets all the rice he saves —one-third of the first swath in each check. It is a proposition to be jumped at; but when you stop to figure that Mr. Brown would thus get one-twenty-first of the entire crop, you begin to see what a bonanza it would be for him.

He is enabled to make such a proposition by reason of his system of attaching a common rice binder to an Avery 8-16 tractor so as to push it ahead of the tractor and not roll down or trample out any of the rice. Beaumont lugs on the wheels enable the tractor to negotiate the soft adobe with entire satisfaction, according to Mr. Brown. The binder is relieved of its ground wheels, being set on an angle-iron frame projecting backward from an extra long main axle, which has to be substituted in the tractor. The angle-irons and sickle bar are held off the ground and the sickle bar raised or lowered by cables passing through a channel iron frame over the seat of the tractor and resting on the ends of the axle. The channel frame is held upright by rods hooked to the front end of the tractor. A balance-beam over the frame holds the weight of the draper end of the binder. A drive rod for the draper is bolted to the flywheel and elbowed to the draper by a bevel gear. The binder has its own clutch, so it may be stopped while the engine is running. The tractor is run on reverse at 1¾ miles per hour, which is the speed most desirable for rice harvesting. Driving on the reverse soon becomes as easy as driving forward. Nothing is added to the binder except its drive. Nothing is added to the tractor except the extra-long axle and the frame work to hold the binder. The outfit may be taken off in half an hour so the tractor may be used as any other tractor. Several of the machines have been bought by the Dodge Land Co. and the one on exhibit was bought during the fair by President W. D. Egilbert of the California Rice Growers' Association.

Spokane is planning a tractor demonstration to be held about May 1.

PLENTY OF IRRIGATION WATER.

[Written for Pacific Rural Press.]

An abundance of water piped to every ten-acre piece of the thousand acres planted to orchards in the Carmichael colonies of Sacramento county has been made possible by pumping from the American river and has enabled the orchardists to keep their trees thrifty in spite of a general lack of enough cultivation because help has gone to war.

The district, including 3100 acres, was organized two years ago last spring, according to Treasurer G. E. Fetters, and was bonded for $90,000. The first bond sale was of $57,600, which sold at 98c on the the dollar. Of this money $22,000 bought the two pipe systems which had already been laid and through which water had been delivered. About five miles of new mains four to twenty inches in diameter were laid, a concrete pump house was built on the river, and an eight-inch pump installed. About a year ago $25,200 of bonds were sold, this time at a premium above par after interest coupons were detached, a six-inch pump was installed, three miles more of mains were built, and valves placed in all laterals. The pumps are run by electric motors, which may be used on either pump in case one motor fails; they pump against a head of 160 feet, giving 20 pounds pressure at the highest point in the colonies. A 12-inch pump is planned for the future, when the rest of the district shall have been put under irrigation.

COSTS OF OPERATION.

Previous to installation of the first pump, the district bought 100 inches of water from an irrigation company and distributed the water itself at a cost over $4 per acre. Conditions before organization had been, as we remember, highly unsatisfactory and loss to settlers had followed undependable delivery of water. A land tax of $2.15 per acre this year against all the property in the district and a water tax of $2.82 per acre to users of water pays interest on bonds, electricity, and maintenance. The district still buys 25 inches through the winter for domestic use to avoid running the pumps. The higher cost this year is due to increased cost of labor and electricity and the tax on the latter.

REDWOOD PIPE USED.

Steel and redwood pipe have been used, but redwood is replacing all the steel mains. The district had an experience which shows the need of keeping the pipe full of water in order to preserve it. On a high corner, where the water was little used, it was shut off one winter. Next spring, when water was turned in, it leaked like a sieve and had to be entirely replaced. The first redwood pipe, however, was a 14-inch main laid in 1910, and it is still in first-class shape, as are all the redwood pipe which have been kept full of water.

THRESHES ONION SEED.

"We are threshing ten sacks of white onion seed per hour with our Advance-Rumley thresher, operated by an Oil-Pull tractor, and saving 99 per cent of the seed, which is much better than we could do by the hand labor method," writes President W. L. Hoyt of the West Coast Seed Growers at Thornton. At this rate it is reported that it will require several weeks to finish the Seed Growers' crop, but it is a great advance in a time when seed is scarce and through lack of man power much of it might be lost.

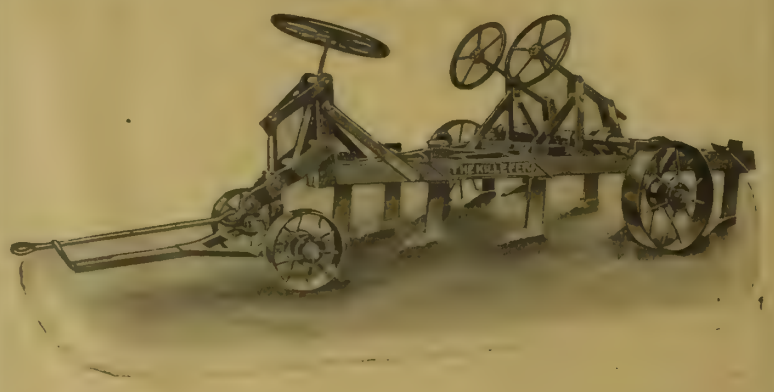
While automobile manufacture is being reduced greatly to make way for tractors, trucks, and munitions, it is still well to remember that the farmer's automobile and truck remove the necessity of driving horses on the roads where work horses should not be, and reduce the acreage that would be taken from production of human food to grow horse feed.

KILLEFER QUALITY

Tractor Chisel

KILLEFER EFFICIENCY

Catalog No. 60.



Our Heavy Tractor Chisel is made to use with the larger Tractors for extreme deep chiseling and is an excellent tool for preparing the ground for Beans, Beets or other crops. If used before the winter rains it will open up the ground to a depth of ten to fourteen inches, aerating the soil and allowing the moisture to penetrate below the usual plow pan, which is to be found in almost all of our land.

The chisel is the "A" frame type. The depth is regulated by turning the hand wheels; one hand wheel for the foretruck and one each for the rear wheels. This gives a three-point suspension, making the tool follow the contour of the land perfectly.

Made in 6 and 8-ft. widths.

The Killefer Manufacturing Co.

2209-21 Santa Fe Ave. Box 156 Arcade P. O. Los Angeles, Cal.

We Manufacture Levelers for Any Power From 6 Horses to a 75 H. P. Tractor

A Schmeiser Leveler

of the "Giant" Type

WILL WORK WONDERS ON YOUR FARM

Moving immense amounts of dirt daily, and working on ground too tough for horses and Fresnos to tackle, SCHMEISER POWER LAND LEVELERS are now being used with utmost success by a great many ranchers, large and small—also by contractors—saving their owners time, labor and money.

WE SEND THEM ON THREE DAYS' TRIAL.

So extremely simple, a child could operate one, as a simple twist of the wrist raises and lowers the bucket or holds it stationary, as the case may require.

YOU SHOULD

send for our latest catalog, J-600, which is full of interesting information on Labor Saving Devices and machines for moving the earth.

Schmeiser Manufacturing Co.

12 Mechanic Street DAVIS, CAL.

Manufacturers of

Sure Pop Almond Huller and Separator, 3 sizes; McGarvin Fruit and Olive Graders, any size; Schandoney & Harrington Equalizing Hitches, any size; Diamond Special Harrows, Baker Clips, Clevises; and Schmeiser Portable Automatic Hay Derricks. We sell the Martin Ditcher and Grader.

MOTOR TRUCK FREIGHT LINES.

Use of motor trucks to save small amounts of food products now wasted on every farm where there are not enough to pay for a special trip, use of motor trucks to aid and supplement railways, especially in distribution of perishables, and use of motor trucks to permit more intensive farming of districts far from present railway lines—these uses are so favored by the Food Administration and the Government, according to A. Owen, statistician at Sacramento for the War Trade Board, that the Priorities Division grants priority in transportation and in the obtaining of raw materials for trucks to be used in marketing or harvesting farm and garden crops while refusing transportation or raw materials for trucks to be used in building work, etc. The question before the Priorities Board is always, "How far will it go toward winning the war?"

In the United States on a recent date, according to Mr. Owen, there were 432 rural truck lines delivering farm produce and returning with supplies for farmers. On file at the office of this Highways Transport Committee in Washington are thousands of letters from farmers in all parts of the country saying that their produce is hauled more cheaply, that quick delivery enables the to get better prices, that the time of man and horse on the road is saved, and they can put four times as much food on the market as formerly.

In many instances farmers have combined to purchase trucks for mutual use. In many other cases a farmer has bought the truck and arranged to market his neighbors' produce.

CALIFORNIA MOTOR LINES.

In California, motor truck lines are under supervision of the State Railway Commission, to whom they must apply for permits to operate. Applicants must show a need of motor transportation on the route proposed and file a schedule of trips and rates. From a list of all freight motor truck routes in California, made out in full to August 1, 1918, by W. J. Handford of the Railway Commission, we have learned the following facts: There were on that date 136 motor truck routes for handling freight in the State. There were 687 freight and passenger motor truck lines. On the 136 freight routes, totaling 6000 miles of regular travel, 196 trucks of 36 different makes and a total of 334 tons capacity were used. The longest two routes are 118 and 119 miles each way. Most of them are in mountain districts, acting as feeders to the railways or as distributors for farm produce and supplies. Ford trucks numbered 18, Federal 17, Packard 15, Reo 11, Moreland 11, Buick 9, White 8, Studebaker 7, Kissell 7, Republic 7, Auto Car 6, Denby 5, Mack 5, Jeffery 5, G M C 4, Garford, 4, Kleiber 3, Moore 3, Little Giant 3, Indiana 2, Menominee 2, Vim 2, Wichita 2, Stewart 2, Maxwell 2, Universal 2, and several others one each. Several trailers are also on duty as traffic demands.

As a relief to freight car shortage, no complaints of such shortage have been received, according to Mr. Handford. Whereas during the previous three years complaints of car shortage were burdensome and the Commission kept men constantly facilitating the movement of empties, getting cars loaded and unloaded quickly, etc., practically no such complaints are now heard. Whether this is due to better distribution of cars, more flexible handling of railways by the Government, or a more philosophical attitude on the part of those who cannot get cars promptly, the fact remains that complaints of car shortage in California have been minimized and the California Railroad Commission does not encourage new motor truck routes to compete with the railroads. They do, however, encourage truck lines to pick up produce, milk, etc., throughout the rural districts in order that the skill and energy of farmers may be saved for production rather than for road travel, and to develop the agricultural possibilities of districts remote from railways.

The Farm Labor Army *de*creases as the National Army *in*creases

In spite of the labor shortage *more* food must be produced—*more* acreage must be put under cultivation. *More* work must be done by *fewer* men.

There is just one solution,—machinery must fill the gaps in the ranks of farm labor.

Tractors must be used—thousands of them—tractors that will actually *do* the things you *want* a tractor to do—tractors that will work on practically *any* kind of ground—in *any* part of the country.

These are exacting demands but Cleveland tractors by the thousands are meeting them effectively.

They are producing food—in larger quantities than ever before—*and are consuming none of it.*

They are plowing 3½ miles an hour, eight to ten acres a day and under medium soil conditions are pulling two fourteen inch bottoms. This is equal to the work of three men and three good three-horse teams.

And the work is not only done faster but *better* with the Cleveland.

The Cleveland is an all-purpose tractor that does a wider range of work than is possible with other types. It is the tractor that works successfully on the side hill.

It plows, harrows, sows and reaps. It hauls, does grading and road work, cuts ensilage and does the hundred and one odd jobs which are always to be done about the farm.

It is tractor and stationary engine in one.

The Cleveland is built on the same principle as the giant battle "tanks." It crawls on its own tracks, laying them down and picking them up as it goes along. It will work practically anywhere—over rough ground, ditches and hummocks, close up to fence corners, and under small trees.

With 600 square inches of traction surface, it goes through sand, gravel, gumbo, mud and even wet clay. It travels over the newly plowed ground without packing the soil.

The Cleveland is only 96 inches long, 52 inches high and 50 inches wide. It can easily be operated by one man and can be housed in less space than is required for a single horse. It weighs less than 3200 pounds.

Yet in spite of its small size the Cleveland develops twelve horsepower at the drawbar and twenty at the pulley.

The Cleveland Tractor was designed by Rollin H. White, the well-known automotive engineer, and is built under his personal supervision. Only the best materials are used throughout. Tracks and gears are protected from dirt and dust, and the track sections are joined by hardened steel pins which have their bearings in hardened steel bushings.

Every farmer can fill up the gaps in the ranks of his farm labor *profitably*—can help the nation meet the food crisis *profitably*—by installing one or more Cleveland Tractors *now.*

Speed up *your* production. Make more money. Write us for complete information and the name of the nearest Cleveland dealer.

General Agricultural Review

Field Crops.

The California Products Company intends to construct a three-stand cotton gin for the cotton producers of Kern county.

The Pomona Valley Packing Co. has commenced packing the second crop of tomatoes. The tonnage is expected to be heavy.

According to a report just given out by V. G. Stevens, quarantine inspector in Los Angeles, the alfalfa weevil has not yet found its way into California fields.

Orange county tomato acreage this year is probably lighter than last, though around Buena Park it is heavier on account of the association which was formed this year.

The 1918 grain crop for the Corcoran district, Kings county, totaled approximately 500,000 sacks, according to estimates made by experienced growers and shippers. A little more than half this amount was wheat, the balance barley.

The Ocean Shore Railroad has been granted permission to increase its charge for hauling manure from Daly City, near San Francisco, to Thornton to 70 cents per ton and to Tunitas to 90 cents per ton, with intermediate rates for intermediate points.

Fresno county wheat growers held a meeting in Fresno, October 2, to consider the wheat smut menace. George R. McLeod of the Sperry Flour Company said he had found in fields not apparently affected that smut had attacked nearly half the heads and dwarfed or ruined them altogether.

This year's cotton crop has been estimated at 11,818,000 equivalent 500-pound bales by the U. S. Department of Agriculture, basing its estimate on the condition of the crop on September 25, which was 54.4 per cent of normal and which forecasts a yield of 154.1 pounds to the acre. The final estimate of the year's production will be made in December. Prior to September 25, Arizona had ginned 1204 bales of cotton, California 4571.

Deciduous Fruits and Nuts.

The fifty-first State convention of the California Fruit Growers will be held in Riverside, November 13 to 15, inclusive.

A record price of $3,144 was recently paid in New York for a carload of fancy peaches sent from Placer county.

A carload of Yellow Newtown Pippins from the Watsonville district were the first apples to go into cold storage this season.

Southern California growers are harvesting a crop of 32,000,000 pounds of walnuts, estimated to be worth $6,000,000.

The University Farm short course in horticulture will be given from October 17 to November 2, during which time diseases and insects, spraying and pruning will be studied.

Due to conditions brought about by the early rains, many of the deciduous trees are liable to start new growth. In the case of pear trees there is danger of the development of pear blight.

Indications at present are that the output of first-class nuts from the Oakdale district will be limited, due to the recent storm, a condition which affects the industry over the State of California.

An interesting bit of grafting is being done on O. R. Wanns place near Calistoga, where a large black walnut, four feet in diameter four feet from the ground, is being grafted over 80 feet from the ground. The grafts are doing well.

Shipments of California fresh fruit this year have broken all records, the Railroad Administration reports. Up to the first of October there had been shipped approximately 15,000 carloads this year, against about 12,000 last year.

Practically all California prunes of all sizes from 30 to 90 choice grade will be taken for Government use. No shipments for civilian use of these sizes will be made until Government needs are provided for, which means that prunes will be scarce in the markets this winter.

Word comes from Pomona that the packing and shipping by the Walnut Growers' Association started last Monday and the growers are expecting the largest returns for their product in the history of the industry. The walnuts are all shipped out as ordered, and none of the crop is shipped to the open market.

Citrus and Semi-Tropical.

It is reported that the loss due to premature and heavy rainfall to fig growers in Western Yolo county was about $60,000.

First commercial shipments of avocados and the earliest record in California were made last week from Porterville packing houses, the fruit being consigned to New York buyers.

The work of picking and packing ripe olives in the Oroville district began last week. The olives are about two weeks early and are running to large sizes and of superexcellent quality.

Approximately thirty carloads of pomegranates will be packed and shipped from the Porterville district this season. There is a good demand for the high quality goods on the basis of $1.50 per half box. The value to the growers will be somewhere about $35,000.

Seventy-five per cent of the citrus associations of Tulare county have joined the new manufacturing company, a subsidiary of the California Fruit Growers' Exchange, which has been formed to manufacture culled oranges into marmalade and other by products. Fruit is to be shipped to Southern California, where two factories are to be located.

Word from the citrus output of the Mountain View Fruit Association for the season just closed was but 33 1-3 per cent of that of the previous year. The returns to the growers, however, were 61 per cent of last year's total. The outlook for the coming year is good. It is expected that the navel crop will be handled mostly by women, instead of Japs, Hindus and Mexicans, as heretofore.

Grapes.

Two shipments of Lodi Tokays sold in Chicago last week for $2,220.75 and $2,315.25 per car each.

Many of the grape growers of Napa county complain that their grapes have not yet enough sugar to justify the picking.

Emperor grapes of the foothill regions of Fresno and Tulare were not damaged by the recent rains, according to growers and shippers. A few frosts are needed to put color into the grapes.

The Critical situation which faced the raisin industry as a result of the last rains resulted in a hurry up demand for labor to save the crop. Some town stores closed up and sent their clerical forces into the fields to help.

CHICKENS SICK? Roup Colds, Canker Bowel Complaint, Limberneck, Sorehead, etc., the best remedy is always GERMOZONE. At most dealers or 75c. post-paid with 5-book poultry library free.

911 Trust and Savings Building
LOS ANGELES, CAL.

WHAT CO-OPERATION HAS DONE FOR RAISINS.

(Continued from page 390.)

000, where other buildings are projected and will be erected as they become necessary.

It is estimated that 90 per cent of the capital stock of this association is held by the growers. It is different from any other corporation in this essential, that its stockholders produce the staple that it markets. About 10 per cent of the stock is held by merchants and others whose interests are closely allied with those of the growers. The company was organized to assure living prices to the growers. Corporation profits are a side issue.

The effect of co-operative handling and marketing of raisins (and other fruits) has been magical.

A BUOYANT SPIRIT PERMEATES THE MEMBERSHIP.

The listless and forlorn habit of mind of the grower has been replaced by a buoyant, hopeful condition that energizes the whole of society. It has led to a broader community spirit that takes pride in working to the improvement of the community. There is always something doing. The schools, the homes, public parks and roads all testify to the rejuvenated civic pride that attends success and languishes under failure. In Fresno as the center and its tributary towns in the San Joaquin Valley there is a feeling of movement and the joy of doing something worth while both in the country and the town. It is reflected in every business where there is a live man in charge—and there generally is. Compare this condition with what it was before the growers "got together"—when so many men wondered if they were going to be "closed out" each year, whether they could afford a new cultivator or could let a son or daughter go to high school. And then consider the California Associated Raisin Company and its relation to the industry.

NO HAY SHORTAGE ON TRUCKEE-CARSON PROJECT.

A story has been circulated broadcast over the Pacific Coast that all the hay on the Truckee-Carson Irrigation Project has been bought up.

R. L. Douglass of Fallon, Nev., who was on the first board of directors of the Federal Loan Bank, of this district, writes us that the story is absolutely without foundation. He says:

"The story could only originate from one source, viz., those trying to buy both hay and cattle below market value. These same parties even went so far as to quote the State Food Administrator as stating that he was going to take a hand in the hay situation, fixing the price on hay in this State. On investigation it was found that the Food Administrator flatly denied any such intention.

"The facts as they exist are that 50 per cent of the hay has been sold at from $12 to $20 per ton in the stack, for first-class alfalfa hay, measured sixty days after stacking. A large number of the biggest producers of alfalfa hay, who have ample facilities for feeding, have not sold their hay and are holding it for $20 a ton in the stack, measured by the one-fourth rule.

"The season has been an exceptionally favorable one for alfalfa hay on this project, with plenty of water for irrigation, and a big third crop is now being harvested."

The Engine Selected by over 150,000 Farmers

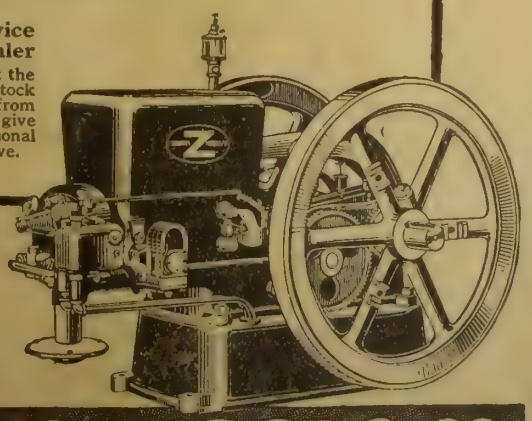
RECORDS made by over 150,000 practical farmers buying over $10,000,000 worth of Fairbanks-Morse "Z" Farm Engines have never been equaled in Engine history.

Demand, as they did:

1. Fairbanks-Morse Quality.
2. Economy in first and fuel cost, and low upkeep.
3. Simplicity and Staunch Durability.
4. Light-weight, Substantial, Fool-proof.
5. Gun-barrel Cylinder Bore.
6. Leak-proof Compression.
7. Complete with Built-in Magneto.
8. More than Rated Power.

You Also Get Service from your Local Dealer

Your local dealer has just the type "Z" for your needs in stock—waiting for you. Buy from him. He is prepared to give prompt delivery and personal service right where you live.



The 3 and 6 H. P. sizes are built to use kerosene, distillate, stove oil, tops or gasoline. The 1½ H.P. size uses gasoline only.

(THE FIELD SEED HOUSE)

COVER CROP SEED

If you're planning to put in a cover-crop, we have the following varieties of seed that should interest you:

Melilotus Indica	$ 9.00 per 100 lbs.
Melilotus Alba	32.50 per 100 lbs.
Canadian Peas	10.00 per 100 lbs.
Vetch	11.00 per 100 lbs.
Rye, "Rosen" Type	6.00 per 100 lbs.

With orders for Vetch and Canadian Peas we offer **without extra charge** bacteria sufficient for inoculating whatever quantity of seed that is required.

Our "ROSEN" type of Seed Rye is an improved strain, grown in Minnesota, and very much superior to the Rye that is generally offered. Get a sample of this and compare it with common Rye.

ALFALFA

Don't buy any until you get our samples and prices. No one can clean seed as we do; our separating machinery is positively the most modern, and if you will order our CALIFLORA Brand you will receive stock that is as free from impurities as it is possible to get seed.

CALIFLORA Brand ALFALFA
$22.00 per 100 Lbs.

We have grades like others offer for less money than you pay elsewhere.

WE PAY THE FREIGHT

Making the Right Start with Beef Cattle

Written for Pacific Rural Press by R. H. Whitten

A YOUNG LAD was very anxious to own a dog, and pleaded with his rich uncle to buy him one.

"Well, Eddie," asked the uncle, "suppose I gave you two hundred dollars for a dog. Would you spend the whole sum on one dog or buy several?"

The youngster thought for a moment and replied, "Well, uncle, if you left it to me I would buy two hundred one-dollar dogs."

Too many beginners with livestock start out as the boy wanted to. They try to buy as many animals as possible with the money at their command and make quantity instead of quality their chief consideration. They seem to think that in order to make big profits they must have a big herd, but actual experiences prove that more money can be made with a dozen or two high-class animals than with a hundred of mediocre breeding and type.

Eight years ago, when registered stock was not bringing the prices that it is today, a farmer back in Michigan bought a Shorthorn heifer at a public sale, paying $300 for her. A few weeks ago he sold this female and eleven of the descendants from her and her heifers for $9,600, an average of $800 per head. Three other heifer calves and all of the bull calves had been sold from year to year—the total amount received being $16,000. In other words, from this modest investment of $300 the farmer received an income equal to $2,000 per year for eight years.

So much for the financial side. Now, take the show ring end and we find that it is not necessary to have an immense herd in order to pick a few animals good enough to win. Let's take a case right at home—that of John A. Bunting of the Mission Hereford Farm, Mission San Jose. Mr. Bunting started with just a few registered Herefords three or four years ago. He didn't have much money to invest, but what he did have he put into just a handful of top-notch animals.

Last year he went to the State Fair as a novice and showed against the old-time breeders. He had only three head that he could take along, but just the same this beginner won five prizes—junior championship, reserve grand championship and three firsts. And to show that it was not due to luck or chance, Mr. Bunting came back this year with eight head and won fifteen prizes, including the two grand championships, one reserve grand championship, one senior championship, and five firsts.

Look at the picture of his grand champion bull which is used to illustrate this article. And then think how well it has paid Mr. Bunting to buy this great sire to head his herd. We don't know how much it set him back to make the purchase, but suppose he had put the amount into two animals instead of one. How far up the ladder of fame would he be today?

NO BEST BREED.

What is the best breed of beef cattle? I wonder if we can't find the mate to that question. It certainly has a mate, for you know Noah took a pair of everything into the ark, and I am sure this question dates back to Noah's time. It has been asked from time immemorial, and people will continue to ask it is long as livestock is raised.

But there is no one best breed of stock. However, there are essential differences which make some breeds less valuable for a given location than one which has a particular adaptation for the conditions in it. Consequently it is advisable to study your local conditions and select the breed best suited to them.

It is well to favor a breed that is popular in the section where you reside, as you will thus find a better home demand for your surplus stock.

And above all things, be sure that you are in love with the breed you decide upon. In your estimation it should have every other breed beaten to a frazzle. The mere mention of it should make your eyes sparkle, your cheeks glow, and your tongue sing its praises. When you get to this stage, and the breed you are so crazy about seems to be a good one for your locality, you are ready to make your start. Decide upon the breed and also decide that you will stick to it until you succeed with it, no matter whether it requires a hundred days or a hundred years.

California Prime Donald, grand champion bull at the State Fair, 1918. Owned by J. A. Bunting, Mission San Jose, whose spectacular rise in the Hereford world proves that you can get to the top quickly if you start with the right kind of stock.

BETTER VALUE IN HOME MARKETS.

In buying foundation stock don't send your hard-earned cash back to the Middle West, thinking that you will get higher quality or better value. Perhaps it may be necessary for the big breeders to occasionally send back for new herd headers in order to avoid inbreeding, but for your purpose there are just as good strains and types of all the different breeds out here; the breeders are just as reliable; the animals are acclimated; the shipping charges are less. Distance may lend enchantment, but that's about all it has to offer. There are some young breeders who point with pride to certain animals and tell that they came from back East, but remember, "Pride goeth before destruction." It is real value that you are after, and your money will get you more in our home market than from any Eastern breeder.

HOW MUCH FOR THE HERD SIRE?

Don't be afraid to invest heavily when it comes to selecting your herd header. Fashionable blood lines, showyard records and fancy points are desirable, but keep utility qualities in mind also, and look for vigor, prepotency, capacity and longevity. Study animals carefully so as to be able to differentiate between the finish that is the result of feeder's and showman's art and the appearance that indicates the natural tendencies and capacities of the animal.

What should you pay for your herd header? Well, at the State Fair we heard Mr. Bunting price at $1,500 a bull calf that would be ready for service in a few months. Let's see if he was worth it to the man who had registered females, for it is common for young bulls to sell at this figure.

If the bull increased the price of each one of his calves only $50 over the price at which the owner had been selling calves, he would only have to sire thirty calves to pay for himself in a year. We don't hear of many investments doubling in a year, but here is one that will. And it will continue to yield bigger returns each succeeding year.

Perhaps you simply want a bull to use on grade cows. If so, you can well afford to pay $500, for a bull at this price will add 250 pounds to the weight of each calf in a grade herd when a year old, and at present prices this means better than $25 worth of extra beef, or $750 in a herd of thirty yearlings. So the bull pays for himself the first year and hands you the neat little sum of $250 for good measure.

BE SURE HE IS REGISTERED.

Even if you never intend to have any registered females; even if you only want a bull for range use, don't accept one without a pedigree. Even though animals "just as good as registered" or "purebred but not registered" may actually be as represented, they will not breed as well as registered stock, for prepotency has not been established in their blood lines.

Remember always that outstanding sires have been, without exception, great by inheritance. A registration paper is not of itself a guarantee that the animal will prove a good breeder, but the lack of one is almost positive assurance that the bull will not be a good breeder. A poor farmer cannot afford not to use a registered bull. A rich one should have judgment enough to buy one without being told.

WHEN TO START BREEDING.

Young bulls may be used lightly when from twelve to fifteen months old, serving not more than two or three cows a week, and not more than twenty or thirty the first season. It is bad policy to change bulls every two or three years. A sire should be kept as long as he gets good calves, unless this causes too close inbreeding.

Heifers are bred at from 16 to 22 months of age—generally at from 18 to 20 months. Some breeders say that if they are bred young they make better mothers and more dependable breeders. Others claim that they need to be developed well first, and that early calving stunts them.

Also there is a difference of opinion as to how soon a heifer should be bred again for her second calf, but a safe rule is to give her a reasonable rest if she was bred young the first time; otherwise breed her after three months, so that she will average a calf a year.

In some cases cows are bred the first time they come in heat after calving, but as a rule it is best to plan on a calf a year, and to have the cows calve a little while after green feed comes on. This means along about February in the San Joaquin and southern coast sections; March in the north central part of the State, and April in the extreme northern part where the winters are severe.

DEVELOPING THE CALVES.

Generally calves are allowed to run with their mothers until the bull calves begin to pay attention to the cows. In the Middle West creeps are provided for the young calves so that they can be fed grain by themselves. This, of course, is not applicable to our range conditions, yet it should be remembered that the younger a calf or steer is the more cheaply gains can be made, and that lack of nourishing feed will

everlastingly handicap the future growth of a young animal.

It is practically impossible to make a bunch of broad-backed, thick-fleshed cattle from calves that have been starved and mistreated during the first year of their lives. As someone has aptly put it, "Nature resents such treatment, and the tight, lifeless hide, stunted body, and the cocked horns pointing in mute appeal to heaven for food, all bear daily testimony against the shiftless and impoverished owner who, in robbing his calves, defrauds himself."

With purebreds it is absolutely essential to feed them liberally and push them to early maturity. They should never be allowed to want for good bone- and muscle-building feeds Nothing will pay a higher premium for the grain consumed than the calves in a purebred herd, and if with proper feeding is coupled plenty of exercise, pure water and constant attention to details, a crop of calves will be raised that will bring fame and profit to the owner, and will establish him as a breeder of quality stock. And this is the foundation of success in the purebred business.

Humboldt County + Cows = Prosperity

[Written for Pacific Rural Press.]

Geography class forward! Now, Tillie Alcartra Smith, tell me what section of the world is the most thickly populated with cows? Holland? No. Isle of Guernsey? Wrong again. Doesn't anybody in the class know? Why, you don't have to go outside of your own State to find the answer, for it is the Eel River Valley in Humboldt county.

The county as a whole is not the largest producer of dairy products in the State. Stanislaus county led in 1917 with 8,935,964 pounds of butter. Imperial county was second with 6,245,487 pounds, and Humboldt county came third with 5,729,882 pounds. But it must be remembered that Stanislaus and Imperial counties consist almost entirely of tillable land, while in Humboldt county we find a great deal of range and forest land. The greater part of the dairying industry of the county is confined to the Eel River Valley, and in this miniature kingdom there are more dairy cows to the square mile than in any other section of the world.

Miniature kingdom is right. It is hard to say whether dairy cows have made Humboldt county farmers prosperous, or whether the county has made dairy cows pay well. But anyway the combination is an ideal one. Livestock raising is the backbone of agriculture, and dairying is the most profitable branch of livestock raising. The valleys of Humboldt county provide ideal conditions for dairying, so furnish suitable cows and you have a prosperous little kingdom.

Again, suitable cows is right. One reason for the success of Humboldt county dairymen is that they have not been satisfied with any old four-legged animals that would pass as cows. They have had active testing associations for years, and the boarder cows have been weeded out. So far they have not gone much to registered stock, but for having well-bred, high-producing, profit-making grade cows we take off our hats to these farmers.

Even though this little kingdom is almost isolated from the rest of the State, it is one of the most progressive spots on the map. For instance, in the close-in sections the milk is picked up by the creameries twice a day. Not on account of hot weather, but in order to turn out superior products.

Very few separators are found on the farms. Instead of selling only the cream and feeding the skim-milk to hogs, as is generally done in other parts of the State, most of the dairymen sell whole milk to the creameries. It is skimmed by the latter and the skim-milk is reduced to a powdered form and sold. A very little skim-milk is sold back to the farmers, the price charged being about 40 cents per 100 pounds for the best grade.

In some of the outlying sections there are skimming stations where the cream is separated from the milk and only the cream is shipped in to the creameries.

Green fields the year around provide ideal pasturage. These fields generally are in red or white clover, or alfalfa. Beets, carrots, field peas and corn are fed in addition to pasturage, but very little grain is used. Silos are just being introduced. They are winning favor everywhere, and soon nearly every dairy will have its "lighthouse."

Little or no irrigation is practiced. With about six feet of rainfall per season and frequent fogs, vegetation is usually kept luxuriant without artificial means. This year, however, the shortage of rain was felt a little, but conditions were not so serious as in other parts of the State.

Mother Nature has been wonderfully generous to the good people of Humboldt county and they, in turn, have made the most of every blessing she has bestowed upon them.

Shorthorn Sale at San Francisco Show

[Written for Pacific Rural Press.]

In a recent issue of the Rural Press we advised buyers of foundation animals of the beef breeds to purchase at home, instead of sending their hard-earned cash back East. We stated that just as good quality and better value for the money could be obtained here at home.

We did not know at the time that very soon a wonderful opportunity would be offered, but since then we have been informed of the Shorthorn sale which will be held at San Francisco, Thursday, November 7, in connection with the International Livestock Show.

The leading breeders of the State have selected some of their best animals in order to place the right kind of foundation stock in the hands of beginners, and a wonderful opportunity is offered buyers to get choice breeding stock at their own prices.

The consignors will include Pacheco Cattle Co., Hollister; Paicines Ranch Co., Paicines; Thornton S. Glide (Hillcrest Stock Farm), Davis; Jack London Ranch, Glen Ellen; W. M. Carruthers, Live Oak; Roselawn Stock Farm, Woodland; T. T. Miller, Los Angeles; Chas. A. Trosi, Vinton; University Farm, Davis; Ormondale Farm, Redwood City, and the Hopland Stock Farm, Hopland.

Earl Gartin of Greensburg, Ind., will cry the sale. Mr. Gartin is a prominent breeder, showman and auctioneer.

GOVERNMENT WILL NOT TAKE OVER PACKING HOUSES.

In seeking a way to relieve the American people from the high cost of living, Congress has practically abandoned the idea of putting the meat packing business under Government control while the war lasts.

Many Congressmen who have been studying living costs state that to add the enterprise to the multitude of huge tasks Uncle Sam has undertaken might defeat the very purpose they have in mind. While they have reluctantly accepted this view, they have not relinquished their adherence to the plan of Government control of packing houses and stockyards as a necessary part of the permanent solution of the high cost of living.

W. J. Higdon, Tulare, has sold a registered Holstein cow and a young bull for a herd header to Joseph Darling, Fresno.

CONTRIBUTORS:

BRIDGFORD COMPANY, Knightsen
LUTHER THOMPSON, Modesto
J. S. GIBSON CO., Williams
C. G. OUTLAND, Modesto
R. L. HOLMES, Modesto
J. M. CAMPBELL, Escalon

Including the complete dispersal of the C. G. Outland herd, and the sale of all of Luther Thompson's cattle of milking age, with high-class consignments from the other four well-known breeders. Among the females are:
12 DAUGHTERS OF HERMANA IGNARO, who is by a son of Ignaro De Kol, the only sire that has nine daughters above 20,000 lbs. milk in one year.
A DAUGHTER OF THE 44-POUND $15,000 BULL, Spring Farm Pontiac Cornucopia, due to calve November 8 to King Segis Alcartra Prilly, twice grand champion bull at California State Fair. The four nearest dams of this heifer average 33.80 lbs. butter in seven days.
POTOKI JOHANNA 2nd, 27.86 lbs. butter in seven days, a real show cow bred to a 29-lb. son of Prince Gelsche Walker.
A DAUGHTER OF PRINCE GELSCHE WALKER, that made 577.8 lbs. butter in one year as a junior two-year-old.
DORA HENGERVELD OF SYLVAN IRIS, 23.06 lbs. butter in seven days as a senior four-year-old, bred to a 29-lb. bull.
A 25.01-POUND COW that made 18,362.3 lbs. milk and 814.23 lbs. butter in one year, now fresh.
A 24.36-POUND COW heavy with calf to King Segis Alcartra Abbekerk, 30-pound son of the $50,000 bull.
A 20-POUND COW that made 644.09 lbs. butter in 320 days, heavy with calf to Prince Alcartra Korndyke, son of Tilly Alcartra.
A 21.90-POUND THREE-YEAR-OLD daughter of Spring Farm King Pontiac, heavy with calf to the twice grand champion bull, King Segis Alcartra Prilly.
AND MANY OTHERS of splendid type and breeding, bred to 29, 30, and 40-lb. bulls.

BULLS

A 30-POUND BULL, two 29-pound bulls, a 25-pound bull, and others of rich breeding, including several nice calves, make up a high-class bull offering.

NOW Is The Time To Buy Holsteins
before the great demand after the war
AT THE
2nd MODESTO SALE, OCTOBER 17, 1918

OUR CONSIGNMENT INCLUDES:

A three-year-old heifer by the $15,000 bull, Spring Farm Pontiac Cornucopia, who is a son of the 44-lb. cow, K. P. Pontiac Lass, the highest record daughter of King of the Pontiacs. The first five dams of this heifer average over 34 lbs. butter in 7 days. Due to freshen November 8-18—to the service of King Segis Alcartra Prilly, the Grand Champion Bull of California, 1917-18.

A four-year-old daughter of Spring Farm King Pontiac, who is a 37-lb. son of King of the Pontiacs, bred to King Segis Alcartra Prilly. This heifer has a 22-lb. three-year-old record and is capable of making a much larger record.

Two high-class cows with 25-lb. 7-day records, one with over an 800-lb. yearly record.

A ten-months-old bull, beautifully marked, light in color and a great individual, sired by King Segis Alcartra Abbekerk, our senior herd sire, who is a 30-lb. son of the $50,000 bull.

Dam of this young bull made 29.80 lbs. butter in 7 days last winter and we look for her to make a very much larger record this winter as a four-year-old. Her dam has a yearly record of 980 lbs. butter from 24,000 lbs. milk. This bull is good enough to head a high-class purebred herd.

Our herd won at the California State Fair this year:

Grand Champion Bull
Grand and Senior Champion Cow
Reserve Grand and Senior Champion Cow
Junior Champion Heifer
First Get of Sire
First Calf Herd
First Three-Year-Old Cow
First Yearling Heifer
First Senior Heifer Calf
First and Second Junior Heifer Calf
Five other awards in classes

Also produced this year eight 30-lb. cows, with records from 30.41 lbs. to 37.60 lbs. butter in 7 days. Also nine two-year-olds making records above 20 lbs.; from 21 lbs. to 26.50 lbs. in 7 days as junior two-year-olds. No other herd in the West has made such a showing in one season.

BRIDGFORD CO., Knightsen, Contra Costa, Cal.

RIVERVIEW FARM
Offers the 17-month-old Holstein-Friesian bull
'SEQUOIA ZOZO PIETERTJE'
This bull's dam, who is also the sire's dam, is a cow of outstanding size and type with a semi-official record of 20252.4 lbs. of milk containing 735.69 lbs. fat, or 919.6 lbs. of 80% butter. Record at age of nine years. Price $250.00.
For photos and pedigree apply,
R. F. FISHER, Carlotta, California.

Consider for your next Herd Sire
a Son of
Colantha Sir Pontiac Aaggie
a Son of
Colantha Johanna Lad
who has two daughters with records above 32 pounds; 20 other daughters that all have outstanding records as heifers.
Our offering this fall in young sires you will find particularly attractive.
GOTSHALL & MAGRUDER
RIPON, CALFORNIA

Stars at San Francisco Show

[Written for Pacific Rural Press.]

Stars of international magnitude will shine in the livestock firmament at the California International Livestock Show, which will be held in San Francisco from November 2 to 10 by a group of prominent men and under the auspices of the San Francisco Chamber of Commerce. These men consider it a patriotic duty to stimulate the raising of livestock in this State, not only to aid the Food Administration during the war but to make California the livestock center in times of peace. This honor has been accorded Holland in the past, but the bluebloods of Holland, both cattle and horses have been sacrificed to feed the people.

"The mongrel stock," said William T. Sesnon, chairman of the executive committe of the association, which is a non-profit-making corporation. "has no place in California. It takes as much feed for this class as it does the high-bred stock, while the latter is ready for market two years before the mongrels. From the economic viewpoint, California has only place for the best."

E. H. Brown, who was general manager of the California Land Show, which was held in San Francisco a year ago under the auspices of the San Francisco Real Estate Board, has been appointed assistant to the president. Owners of many noted Eastern and California stables are making arrangements to enter their horses in the Horse Show, which will be one of the entertaining features of the Livestock Show. John Rosseter will exhibit his $60,000 Arabian horse, Friar Rock, and Tom Bass of the noted Missouri stables bearing his name will send the famous Belle Beach. Tandem driving, saddle and harness combinations and five-gaited exhibitions will be among the features.

One of the fastest two-year-olds in the world will be at the exposition. This horse is one of four Arabian horses entered in the breeding class by S. C. Thomson of Concord, Cal. The four will be seen in the parades at the Horse Show. They boast the desert strain which marks the high-bred Arabian. The two-year-old, as well as the other three horses, are remarkable for their swiftness and endurance. Thirty thousand dollars in prizes are to be given by the association for the best exhibits of livestock and ten thousand dollars will be awarded in the Horse Show.

Officers and advisory board of the show include Edgar J. De Pue, president; William H. Crocker, Milton H. Esberg, James J. Fagan, A. W. Foster, R. B. Hale, Maurice A. Hall, Frank Honeywell, Fred W. Kiesel, C. K. McIntosh, John D. McKee, L. A. Nares, William Mayo Newhall, Fred M. Pickering, Warren R. Porter, T. H. Ramsey, B. F. Schlessinger, William T. Sesnon, Vanderlynn Stow, Gordon H. True, F. L. Washburn, Ralph P. Merritt, Food Administrator; Dean Thomas F. Hunt, University of California; Fred J. Koster, president of San Francisco Chamber of Commerce; C. C. Moore, chairman State Council of Defense, and Dr. Ray Lyman Wilbur, president of Stanford University.

REWARD—BULL STOLEN

Taken from my pasture October 5, a five-year-old Holstein bull, weighing 1650 lbs. About half black, nicely marked and fairly good looking individual. Said to be from registered stock, but papers lost.

Been used in my herd four years. Gets fine looking calves, but 30 daughters averaged 86 lbs. per year less butterfat than mothers during first-calf periods. Ought to have exceeded mothers by 86 lbs. each. So bull has been robbing me of 5160 lbs. butterfat per year, worth $2580.

Dangerous To Be At Large

Bull is bigger thief than man who stole him. Watch out! Don't let him get into your herd and rob you.

I don't want to use him again, for now have real registered bull with papers, bought from responsible breeder. But will gladly pay $50 reward for his return, so can send him to butchers, where every unregistered bull should go.

E. Z. MARK, Simpletown.

Fine Stock for the Modesto Sale

[Written for Pacific Rural Press.]

The highest record cows, daughters of the highest record cows, bred to the highest record sires, ever offered at public sale in the San Joaquin Valley will be found at the Second Modesto Sale, to be held at Modesto, Thursday, October 17.

The consignment of Bridgford Company includes a three-year-old heifer by the $15,000 bull, Spring Farm Pontiac Cornucopia; a four-year-old daughter of Spring Farm King Pontiac, bred to King Segis Alcartra Prilly; two cows with 25-pound records, and a ten-months-old bull by King Segis Alcartra Abbekerk, out of a 29.86-pound cow.

R. L. Holmes has consigned Buena Alta Queen Broulet, a typey heifer due to calve about the time of the sale by Domino Glista; also a yearling bull.

Luther Thompson has consigned four head, including his herd sire, Sir Chimacum Wayne Woodcrest.

C. G. Outland has consigned his entire herd of 18 cows, 8 heifers, 2 bulls and 9 or 10 calves.

Other consignments will be equally as good. Better attend and buy. It's a sure, safe business proposition.

Let's Go to the Liberty Fair

[Written for Pacific Rural Press.]

We've been told all about it. We know that we ought to go—that we will have a dandy good time and will derive a great deal of practical benefit.

Really, there is no good reason why we should not go. The heavy work of the season is over, and we need a rest and change. Sticking right to our work day after day gets us into a rut, but a few days at the fair will put new life and ambition into us. The prosperous farmer should have enough sense to attend without being urged. The poor, struggling farmer cannot afford to stay away, for in no other way can he get ahead more quickly than by learning new methods of doing things, such as will be demonstrated at the fair.

Remember the dates. The fair proper will be held at Exposition Park, Los Angeles, October 12 to 26, but the Livestock Show does not begin until the 20th. Take the wife and the kiddies along. There will be attractions for all.

THINK
—and Profit Thereby

FACT NO. 1—A. W. Morris & Sons Corporation, Woodland, Cal., have developed a herd of registered Holsteins that by sheer merit both in production records and showring records has become known throughout the whole world as one of the greatest herds of the breed, and in some respects as the greatest herd of dairy cattle of any breed ever owned and developed by one firm on one farm.

FACT NO. 2—Of the five herd bulls in service in the Morris herd, every one of them has sired a world's record daughter or has for a dam a cow that made one or more world's records. No other herd in the world, using five herd bulls, can equal this.

FACT NO. 3—In this sale A. W. Morris & Sons Corporation will sell many of the tremendous producers that have helped to make their fame world wide, and these great females are in calf to one or the other of the five master herd bulls.

FACT NO. 4—The Morrises are retaining in their herd the daughters of these splendid cows, and they will be developed to their fullest capacity. Remember, then, that the calves these cows are carrying are brothers and sisters to the heifers upon which the Morris company are centering their whole breeding effort and skill.

FACT NO. 5—Every animal in this sale is positively guaranteed to be a breeder. We who have had an opportunity to observe the Morris methods at close range know what a Morris guarantee means, and know well their firmly rooted policy of giving those who buy from them an absolutely square deal, even to the benefit of a doubt.

FACT NO. 6—In spite of the fact that world famous cows, daughters of world famous sires and dams, bred to the greatest combination of herd bulls on earth, will be sold in this sale, the sellers expect only modest prices to prevail. They instruct us to be perfectly frank in our announcements of this sale, emphasizing the fact that some of the most noted cows are along in years, that some have lost quarters, and that no animal in this sale will be tuberculin tested, but that regardless of what you bid on any animal in this sale every single one will be sold to the highest bidder absolutely without reserve or limit.

THE SALE WILL CONTAIN

90 Registered Holstein Cows
15 Registered Holsteins Bulls

and will be held on the farm of

THIS BULL Will Increase Your Butterfat

He is out of a daughter of Prince Riverside Walker and is a typey son of Model Francis Glista. Both of the above bulls are out of great producing families. Write or come and see him and other Holstein stock we have for sale.

C. C. SLATER, Pacheco, Contra Costa County.

Fresno Fair Proves to Be a Hummer

[Written for Pacific Rural Press.]

Considering the inclement weather and the war conditions, the Fresno District Fair, held October 1-5, was very well attended. The livestock show was not quite as large in numbers as in previous years, but ranked high in quality and brought out some very fine herds and individual animals.

In the dairy classes the Holsteins were represented by W. J. Higdon, Tulare, with 15 head; H. E. Vogel, Fresno, 11 head; Frank Helm, Fresno, 8 head. Higdon won nearly all championships and blue ribbons, while Vogel took second honors.

The Jerseys were represented by Guy H. Miller, Modesto, and J. E. Thorpe, Lockeford. The honors were about evenly divided. Thorpe won the $100 purse for the best complete herd.

The Ayrshires were represented by E. B. McFarland, San Mateo, who was awarded all prizes.

Miller-Maxwell Co., Steamboat Springs, Colo., were delayed while en route and did not arrive until Wednesday morning. They had 12 head of Shorthorns and made an exceptionally good showing under difficulties. All prizes were awarded to them.

J. Bidegary, Fresno, made a fine showing of sheep and was awarded all prizes.

The keenest competition was in the swine classes. H. I. Marsh, Modesto, was there with his fine show herd of Poland-Chinas and, although he won most of the blue ribbons, he did not have a walkaway, as Fred Gatewood, A. Buckland & Son, and Chas. Gatewood & Son, all of Fresno, showed some real hogs and made the judges do some careful figuring. Chas. Gatewood & Son received the award for grand champion boar, on King's Big Bone Leader, the grand champion at Sacramento.

Durocs were shown by J. E. Thorp, Lockford; H. Cummings, Visalia; W. J. Fulgham & Son, Visalia; Allen Thompson, Tulare; Chas. E. Ellis, Tulare. The awards were well scattered.

J. E. Thorp, Lockeford, showed two Berkshires and, there being no other entries, he won on both.

Very few horses were shown, but the poultry display was good.

BERKSHIRE SALE CALLED OFF.

W. M. Carruthers, president of the Western Berkshire Congress, informs us that, on account of the labor shortage, breeders have found it impossible to get their hogs in shape for the sale which was announced to be held at the Liberty Fair, Los Angeles, and consequently the sale has been called off.

Over two and one-half million dollars' worth of lambs will be shipped from Alturas, Modoc county, this year. A nice little wad of money!

Innisfail Dairy Shorthorns

Exhibited 16 head at the State Fair, including a group of five cows in milk, among them

BELLEVUE DAISY—Record: 8480 lbs. milk, 322 lbs. butterfat.

PRINCESS CLAY.

Marking the Fall Litters

[Written for Pacific Rural Press.]

Have you ear-notched the pigs that have been farrowed this fall? If not, you should mark at once all that have been farrowed so far, and hereafter ear-notch each litter at birth, except pigs to be raised for market.

Aside from the trouble a breeder has in identifying his pigs if they are not marked, there is no more certain way to cause a lack of confidence in prospective customers than failure to have litters marked, with a complete record of such markings. Laxity in this respect immediately brings a doubt into the visitors' minds regarding the sincerity of the breeder, or the correctness of such information as he may give. Also, the lack of ear-marks puts a man in the show ring in a bad light in exhibiting litters or other groups of same sires and dams.

It is a very simple matter to mark litters according to the method here described and illustrated.

Every notch in the lower edge of the right ear means a count of one. Consequently, if there is one notch it means the first litter farrowed; if two notches, the second litter.

One notch in the lower left ear always means three counts. Consequently, when there is one notch it is the third litter; when two notches the sixth; when three the ninth.

Thus, after using two notches in the lower right ear for the second litter, you use one in the lower left for the third, instead of three in the lower right. In other words, you change to the lower left at every count of three.

Then, after you have numbered through nine, instead of making more notches in the lower parts of the ears, you change and make one notch in the upper right ear, which always means a count of ten. Two in the upper right ear mean 20.

But here also, instead of making three notches for thirty, you change to the left ear, and one notch in the upper left always means thirty. Two notches mean sixty, three ninety.

This is as far as is illustrated, but if you want to go higher a notch in the pointed end of the right ear means a count of one hundred, and one in the end of the left ear means two hundred.

A hole punched in the right ear, mid-way between the point and the spot that will be punched later for an ear tag, means a count of four hundred, and a similar punch in the left ear means eight hundred.

Thus it is possible to number over sixteen hundred different litters without badly disfiguring the ears.

The notching should be done right after the pigs are born, as the ears will not bleed at that time. A harness punch may be used, so placed as to take out a half circle from the edge of the ear, or a regular punch for the purpose may be procured from a store carrying supplies for livestock men.

A simple method of ear-marking pigs so that the litter one belongs to can be told at a glance.

Keep a record giving in each case the number or name of the sow, date of farrow, number of pigs of each sex farrowed, and number that died at birth, if any.

IMPACTION OF STOMACH.

To the Editor: Several of my cows have had what my veterinarian said was impaction of the stomach. In several cases this resulted in death, but when the veterinarian could get there soon enough he injected something into the neck which caused a passage in about ten minutes and the trouble was overcome. I would like to know what this was, so that I can keep a supply on hand and be able to administer it quickly.—J. V. P., Livingston.

[Answered by Dr. E. J. Creely.]

The impaction was of the rumen—first stomach. The veterinarian probably used ½ grain arecoline hydrobromide and ¼ grain strychnine, mixed and dissolved in distilled water. It would be well to give in conjunction 2 pounds Glauber and 2 pounds Epsom salts as a purgative.

Conejo Ranch to the Front

[Written for Pacific Rural Press.]

At Newbury Park, on the Ventura highway, about forty miles northwest of Los Angeles, is the Conejo Ranch, which promises to become one of the greatest swine breeding establishments in the West. It is owned by the Janss Investment Company of Los Angeles, a concern backed not only by unlimited capital but also by plenty of brains and good judgment.

This company has gone into the leading Eastern herds and picked seven prizes were captured, including grand champion sow and reserve grand champion sow.

These same herds will be shown at the Liberty Fair, together with a carload of fat barrows. Watch for a great clean up.

In the accompanying illustration we show Western Girl, a senior yearling prize winner; Model Lady, reserve grand and reserve senior champion; and Critic's Rose, junior yearling prize winner—all in the Duroc

State Fair prize winners owned by Conejo Ranch, Newbury Park.

the cream of Durocs and Hampshires—the two breeds in which the firm is specializing. And to show that the men who do the buying are some pickers, we need merely to refer to their record at the recent State Fair, where with sixty animals entered they won sixty ribbons.

In the Duroc class twenty-three ribbons were won, including grand champion boar, reserve champion boar and reserve grand champion sow. In the Hampshire class thirty-classes at this year's State Fair. Notice the type, quality and finish—characteristics found in all Conejo Ranch hogs.

Dr. J. A. Crawshaw, the Poland-China breeder of Hanford, has purchased the boar, Giant Buster, from Williams & Thornton of Indiana. He will change his name to Kings County Buster. This boar will assist the present herd boar, California Gerstdale.

C. J. Gilbert, Lancaster, is a live-wire Hampshire breeder. He already has 50 head of high-class recorded animals, and is developing a wonderful herd.

15,000 to 30,000 Pounds of Milk

Seventy-seven cows have been admitted to the Holstein-Friesian Advanced Register that have produced 7000 to 15,000 quarts of milk in periods of ten months to a year. The capacity of the Holstein cow for milk is a matter of extraordinary interest.

Live Stock and Dairy Notes

Livestock breeders all over the State are invited to send, on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.

The Dairy.

J. H. Hackett recently sold a registered Jersey bull to Gartin & Sykes of Ceres.

Dora Hengerveld of Silvan Iris, owned by L. D. Thompson, Modesto, has recently made a record of 23.06 pounds of butter in seven days.

We are a little late, but none the less enthusiastic, in reporting the record of 35.18 pounds of butter made by Creamcup Vogelschen Cornucopia, in the herd of Gotshall & Magruder at Ripon.

The Valley Creamery of Stockton has been purchased by the Milk Producers' Association of Central California and added to its string of plants. It is announced that J. E. Humphreys will be in charge of it.

The John Lynch Ranch of Petaluma recently sold two registered milk strain Shorthorn heifer calves to John Whobery of Myrtle Point, Ore., and one registered bull calf to Brownson Brothers, Bridge, Ore.

W. L. Mitchell of Napa will ship a carload of high-grade Jersey cows and one purebred bull in a week or two to Charles Lucas, Honolulu. Mr. Mitchell is a breeder of purebred Jerseys and is going to turn his attention more to that line.

J. E. Wherrill of Riverside has recently purchased from T. F. Cooper & Son, Coopersburg, Penn., the noted bull, Pursell Oxford Prince, considered one of the best Jerseys ever brought to the Coast. He is by Oxford You'll Do and out of Golden Fern's Priscilla.

A. R. Bates of Modesto, chairman of the State Dairy Bureau, has been interviewing dairymen around Tulare in the interests of a project to build a $100,000 cheese plant in that city. The same organization is operating at Salida the largest cheese plant in the United States.

The heifer, Anoka Diotime Korndyke, 25 months old, purchased of the Anita Baldwin breeding farm in the Guaranty Sale last December by H. E. Cornwell and A. M. Bibins, has completed a seven-day record of 17.39 pounds of butter. The price paid for her was $1,350. She is on semi-official yearly test.

Last week, in mentioning the breeders who will show at the Liberty Fair, we inadvertently omitted the Elliott-Brant Rancho, Owensmouth. This well-known concern has always been a prominent winner at our shows and has in its Guernsey herd cows that have made both state and world's records for production. They will show a fine lot of Guernseys at Los Angeles.

Excitement in Jersey circles is intense over the announcement of the sale by the Waterloo Jersey Farm, Waterloo, Iowa, of a half interest in the yearling bull, Financial Sensation, to Greystone Jersey Farm, Westchester, Penn. Hugh G. Van Pelt, the dairy cattle judge, is at the head of the selling committee and P. M. Sharples and Dale E. Andrews are owners of the Greystone Farm. The purchase also included twenty cows at $20.000. Going some!

Beef Cattle.

Stockmen near Dunnigan are feeling great anxiety because a few cases of anthrax have recently been found in that section. Dr. Iverson, State Veterinarian, and Dr. Alexander, County Veterinarian, made an investigation and they urgently request any stock-raisers discovering signs of the disease in their cattle to report the matter immediately either to State or county headquarters, so that active steps can be taken to stamp it out.

Swine and Swinemen.

The Ireland Ranch, Owensmouth, recently sold the Duroc sow, Lady Marion, to L. W. Serel, Van Nuys; a six-months-old boar to Arthur Peck, Owensmouth; and a six-months-old gilt to Mrs. J. E. Norris, Zelza.

N. K. Horan, Lockeford, announces that he has purchased the remaining one-half interest in the great Eastern Poland-China boar, Big Bone Bob, from Young & Clark, Lodi. Mr. Horan has as a herd sire Major Hadley Wonder, the grand champion at the State Fair last year.

J. C. Craig has recently purchased a fine ranch at Owensmouth and intends to develop it into a model Duroc establishment. He has a sow, Red Rock Jean, that has produced 26 pigs in three litters in 14 months, and these pigs have averaged 50 pounds each at eight weeks of age.

At the Kings County Farm Bureau Auction Sale, September 16, one carload of hogs brought $18.80 per hundred pounds, this being the best price ever paid in the State. The carload was made up of 81 head, uniform in quality and finish, and averaging 200 pounds each, grain fed. This car brought the farmers $648 more than could have been obtained locally. Did you get that?

W. J. Sandercock of San Francisco, owner of Natomario Farm, near Sacramento, has purchased from Frank A. Brush, Santa Rosa, the Berkshire boar, Baron Duke 201st, that was made grand champion at the National Swine Show at Omaha last year. Mr. Sandercock had previously purchased much of the best stock in the Brush herd. He is developing one of the leading herds of Berkshires on the Coast.

Sheep.

Miller & Lux, through Sam Stoddard, bought three Hampshire and three Shropshire rams at the Salt Lake sale. They are running 175,000 sheep. Whew!

A. S. Mann, Ukiah, bought at the Salt Lake ram sale for $1,500 a pen of ten yearling Rambouillet ewes consigned by F. S. King Bros. Co., Laramie, Wyoming.

L. V. Olcese of Bakersfield bought 25 Rambouillet rams at the Salt Lake sale at $180 each. He is one of the old-timers in California, but is a progressive breeder and is satisfied with nothing but the best.

Charles Kimble, the well-known breeder of Hanford, bought some of the choice ones at the Salt Lake ram sale. An $875 ram will add luster to his stud and a buck that he bought at $575 is a jim dandy.

CREAMERY OPERATORS' CONVENTION.

The nineteenth annual convention of the California Creamery Operators' Association will be held at Visalia, October 17-19. A very elaborate program has been prepared, including addresses by Prof. G. H. True, Prof. F. W. Woll, Dr. C. L. Roadhouse, and S. L. Denning of the University Farm, L. M. Davis of the U. S. Bureau of Markets, Ed. H. Webster, El Centro; George R. McLeod, Stockton; S. H. Greene, San Francisco; J. M. Henderson, Jr., Sacramento; J. P. Murphy, Tulare, and others. There will be a butter scoring contest and a butter judging contest.

Poultry for Profit

By Susan Swaysgood, Pomona.

THE RATIONALE OF THE MOLT.

Naturally all feathered birds molt once a year in fall, then if very hard weather comes we notice a closer and heavier coat of feathers on wild birds. When this occurs the extra feathers are usually dropped gradually before spring opens, without our having any knowledge of the occurrence except we happen to kill a wild fowl. With domestic poultry it is different, because they are under our eye all the time and we learn to notice everything connected with them—at least we should do so. A great many notice the loose feathers lying around, on the ground and in houses, but do not know the cause.

MOLTS CAUSED BY FOOD CHANGES.

Now, in the majority of cases these partial molts are caused through the feed—either through a change in variety or a change in quantity. Both cause some kind of a molt varying according to the seriousness of the change. A shortage in food will start a serious dropping of feathers more quickly than anything else. This is because the system begins to draw from the outer skin to keep the internal system going. This was the leading idea in molting hens when eggs were cheap, so as to have them laying when eggs were high. It was practised several years ago more than it is now, because it turned out that while a hen could be fooled part of the time all the hens could not be fooled all the time—which means that while it worked in part, a great many hens took on another molt just about three months later, and that at a time when eggs were really worth more than in the early fall months. The forced molt is not near so popular now. Another cause that contributed to its unpopularity was that many hens, heavy layers usually, succumbed to the harsh treatment of starvation, just at a time when they needed extra feed to offset the season's hard work.

DON'T CHANGE FEED TOO ABRUPTLY.

The second way of starting a molt is by making too radical a change in the kind of feed. If a change is desirable or necessary, it is best to commence making it gradually, say feeding one-fourth of the new feed with three-fourths of the old, then adding just a little more every day until you are feeding all of that one kind if you wish. Hens will thus not notice it to any extent; and if it happens to be anywhere near as rich in protein they nor the egg basket will never make any signs. While if you start in to feed it on the "eat it or starve plan," very likely the egg production will drop and the feathers will loosen and eventually drop, and you have an improvised molt on your hands.

A LOSING CONTRACT.

The poultryman who starts out to force his hens into eating what they do not relish has a losing contract to fill. Consult the hens and then use persuasion. Another way of starting the molt is by trying to get along without any kind of animal food, then, when the eggs drop short, suddenly feeding beef scrap again. The hens, being hungry for it, eat to excess and that disturbs the digestion. Nature tries to throw off the surplus through the bowels and skin, and anything that disturbs the skin loosens the feathers—and there you are again! Another partial molt results; it may not be serious, but it is an interference with the egg production and also with the vitality of the hens.

SUDDEN CHANGES OF TEMPERATURE.

Extreme changes in the temperature are also the cause of partial molts. During a term of excessive heat the fowl's body is deprived of moisture to such an extent that drinking does not fill the bill. The surface skin draws tight and the feathers relax, then in a few days commence to fall. All that can be done in this case is to supply moisture to the atmosphere by sprinkling the ground and houses, making everything as cool as possible, which if it does not stop the feathers falling altogether will lessen it to a marked extent and save the falling off of eggs.

ELECTRIC LIGHTS UPSET HEN'S CALCULATIONS.

Electric lights, supplied during the winter, throw the hens into a partial molt in the spring time, but I don't consider that is any loss, because the hens rest up a little while and are soon back to work again. But it goes to show that any disarrangement, however or for whatever purpose it is made, upsets the hen's calculations.

GREEN MASH FOR POULTRY.

To the Editor: I have been keeping poultry for forty years, and I never had anything to equal it. You have to have grain, and after grain comes milk. If you have milk, you have to have some greens, but if you have no milk then you need more greens. My experience is that if you feed kale and chard in the leaf hen's won't eat enough to do any good. Of course, they will eat it; but only because they are starved to it. But cut or ground fine enough to be eaten as a mash, they will eat greens that have been wilted so they would not touch them otherwise, also the stalks.

If greens are not cut or ground finer than most poultrymen cut them, I would rather feed in the leaf. I consider the green mash as the best thing I have heard of in the poultry business. For a large flock I should use alfalfa for most of the greens.—H. R. Dakin, Santa Cruz.

THE MEDICINE CHEST.

It is a good idea these autumn days to have a small medicine chest handy, because often a dose of physic drives away colds that may develop into roup in just a few days. For a plain physic, a bottle of castor oil will be found efficacious, but the after-effects are not felt by chickens as long as are some drugs. Don't forget, too, that when broody hens stay on the nest in the fall that they are breeding lice and harboring mites all the time they sit. Some people seem to think because hens have been laying well all summer they are entitled to a rest in the fall; but if they need a rest let them take it outdoors, not on a nest. The nest is supposed to be for layers, who jump off and cackle when they have deposited an egg, and there is no sense in letting non-layers monopolize the nest for several days at a time because they want to rest. Bounce them off, put them under a wire coop right in view of the rest of the flock, and they will soon forget the need for solitude. Feed and water them, of course, and let them stay outdoors in the open until the fever leaves them.

A two-day field meeting and poultry conference will be held at the Vineland International Egg-Laying and Breeding Contest at Vineland, N. J., on October 11 and 12.

ENTRIES FOR POULTRY AND RABBITS AT SAN FRANCISCO LIVESTOCK SHOW OPEN TO OCTOBER 15.

For the reason that entries for the general livestock displays at the San Francisco Livestock Show closed October 5, some poultry and rabbit exhibitors think all entries close on that date. Entries in the following divisions are open until October 15 and should be addressed as follows: Poultry entries to George H. Croley, 525 Market street, San Francisco; rabbit entries to Walter Hickling, 3335 Lincoln avenue, Oakland.

Harrison Bentley of Napa has 170 hens and he has kept account of his earnings from them for the past nine months and it amounts to $690, and he says they will nearly reach $1,000 by the end of the year at the rate they are laying. His expense for the nine months was $325.06.

Poultry Breeders' Directory

Rates 3 cents per word per week

BARRED PLYMOUTH ROCKS—Winners at leading shows and wonderful layers. Choice stock for sale. "Nothing better in poultry." Catalog free. Chas. H. Vodden, Box 396, Los Gatos, Cal.

HOME CIRCLE

IF I MISS ONE CHANCE.

(Contributed.)

Over in France where the death shells scream
The boys are fighting as in a dream;
A glorious dream of blood and hell,
While I stay at home and prosper well.

Over in France they are dying now
Like red earth turned by a giant plow;
They are going across with a smile for me,
While I stay home in security.

Over in France the gas clouds roll
And the shower of steel is taking its toll;
The flag drives on, but the boys lie still,
While I live on and eat my fill.

Great God in heaven, in whom we trust,
Turn the food in my throat to dust;
If I miss one chance that may come to me,
To bring them home with the victory.

LUCILLA'S PRIZE.

"Oh, but all your marks can't be so bad. You always answer in geography."

Beryl spoke cheerfully. It is easy to be cheerful, Lucilla reflected, when you know that you are pretty safe for the general proficiency prize, and sure, quite sure, of both Latin and French! How she wished this warm afternoon, as she stood leaning over the gate of Beryl's pretty garden, that she herself had studied hard, from the very beginning of the year—that beginning that seemed so far away now, in the warm sunshine.

"There is no geography prize," was all the answer she made. "Geography's counted in with general English subjects, and my grammar"— She gave an expressive little shudder.

"Well, I'd do what I could in these four weeks," advised Beryl. "Come in and rest, won't you? I've some extra studying to do—she gave us double Latin today, for some unknown reason!"

"She" was, of course, the language teacher.

"No, thank you. I'll go home," replied Lucilla.

Home she went, with a very sober little face. For two long years she had been feeling fatherless, because her father had been at work "down in the Zone." Now he had a long holiday, and would be home just about Commencement Day, and Lucilla would have no prize to show him! He had spoken of his anxiety about her school work in so many lessons, and she had always meant to "put on steam," but somehow she had not done it, and now Commencement was four weeks off and examinations three.

"You had better rest before you begin to work, dear," suggested Mrs. Dean, as her daughter entered.

"Mother," began Lucilla, desperately. "Please take out my reports, and let's go over them. I want to see just where I stand."

Mrs. Dean went to the desk. As she looked at Lucilla's troubled face, she felt tempted to bid her not worry; that her father would be so glad to be with his loved ones that he would not think much about the prize that wouldn't be there. But she was a wise mother as well as a tender one. It occurred to her that perhaps this trouble now might make her heedless little daughter more industrious in the future. So she handed out the reports without a word, and sat down to her work, embroidery for Lucilla's Commencement frock.

Lucilla was reading the disheartening figures, when a knock sounded at the door. She looked up, and gave a cry of joy. There stood her much loved little cousin, Charlotte Gray.

"Why, Lottie! How did you get here alone?" she cried, for Lottie was only ten, and her home was thirty miles away.

"Mother's here, too," explained Lottie, and her mother came in at that minute.

While Mrs. Gray and Mrs. Dean conferred over supper preparation in the kitchen, Lottie told her own small woes to Lucilla, while Lucilla flew back and forth, setting the table.

"Mother's going away, and I'm coming here. I want to come here, but I don't want mother to go away," she explained, her little face puckered perplexedly.

That night, when Lottie was safely tucked away in a cot in Lucilla's room, Mrs. Gray told her daughter that her sister-in-law was traveling West to see her twin brother married, and that she feared the long trip for Lottie, who had not been strong. That was why Lottie was to stay with them.

The next day, with rather better lessons than usual, and proudly chaperoning her cousin, Lucilla found the day go quickly. But Lottie—rather a spoiled little girl, if the truth be told—had been unhappy. She did not like her teacher. She did not like her classmates. She could not do the lessons.

Lucilla coaxed and petted, and finally helped her so much with the lessons that Lottie went to bed cheered.

The next day, in order to bring about, if possible, pleasanter relations between Lottie and the other members of her grade, Lucilla spent all recess with them. Only one of the class, Roberta West, seemed able to put up with Lottie, and she was the very dullest.

"Come to our house after supper, if your mother will let you," proposed Lucilla. "And I will help you, with Lottie."

This proposal poor dull little Roberta hailed with joy. The next day, two other backward children asked to be allowed the same privilege. Lucilla said, with a smile, "The more the merrier."

"But, mother," she cried, that night when Lottie was in bed, "I find my lessons easier, not harder, for all this extra work. Isn't that odd?"

"I think," said Mrs. Dean, smiling, "that your love for Lottie makes the extra work easy, and that the exercise makes your own less formidable. Your trouble was always bringing yourself to settle down and make a beginning."

The three weeks went swiftly by. Just before Commencement Mrs. Grey returned and took Lottie away, but the "evening class for study," as the little girls called it, went on till the examinations were in full swing.

"Well," sighed Lucilla, the night before Commencement, which was also the day of her father's expected return, "I've just not failed; that's all. But I'm at the foot of those who passed."

"Next year you'll do better," prophesied her mother, "and don't cry over spilt milk, dear. Make stepping-stones of your failures. We can all do that."

For the second time in this story a loud knock at the door, much louder than the first, startled mother and daughter, but before it could be answered it opened from without. A tall, bronzed man stood there, and the next moment, after joyful cries of "Wife!" "Daughter!" "Father!" "John!" the three were clasped in one embrace. Even prizes seemed very small things beside that happiness.

But the next day, when other girls, including Beryl, went up for their prizes, Lucilla's heart sank again. It would have been nice, oh, it would, if she could have crowned her father's home-coming with the success he valued for her!

There was no prize, however. No one remembered that she had written a special essay, or done anything deserving of an extra prize. The Commencement festivities came to an end, and only one thing could have been worse—if she had failed!

Mr. Dean, with his wife's hand on his arm, and his other hand on Lucilla's shoulder, said not a word about his disappointment, for which Lucilla was grateful, but his very silence intensified her own regret. Oh, if one could realize in September the month that school girls take lightly, what it means to have a good start!

Just as they were at supper, a meal which Mrs. Dean had made very festive indeed, there came the third and last knock of this story.

Two little girls, Roberta and another, stood outside the door when Mr. Dean opened it.

"For Lucilla,' 'they said, handing him a packet. "From our fathers and mothers."

They ran away, laughing. He brought the packet in, and gave it to his daughter.

"It isn't your birthday," he remarked.

"Open it, dear"; her mother was interested as Lucilla herself.

The packet proved to contain a handsome edition of Longfellow's poems, and on the flyleaf were these words:

"To Lucilla Dean: An appreciation of her kind help during the last month of term."

Underneath this inscription were the names of three fathers and three mothers.

"But I never 'dreamed!'" cried Lucilla, with shining eyes. "I only wanted to help those who were kind to Lottie!"

"But you need not call this a Commencement without a prize," said her father, with a smile. "Now, are you ready for fried chicken?"—Lee Wyndham.

THE SECRET.

To a Dimple said a Frown,
"I would give you half a crown,
To teach me how a compliment to win."

To the Frown replied the Dimple,
"Why the trick is very simple:
Dance on tiptoe all around the mouth and chin."

—John B. Tabb.

GENERAL THRIFT MAKES TREMENDOUS GAINS;

Before the Food Administration took charge of food stuffs, the average housewife was not wasteful, but she learned of the possibility of still further thrift as the result of scientific research in food values and began immediately to practice economy on a new and more comprehensive scale.

The average person, man or woman, does not realize that from sixty to ninety per cent of the fuel consumed in their stoves is wasted, absolutely lost up the chimney through smoke, soot and fumes.

When scientific research has proven this, why continue to waste when an easy means, a clean way of correcting the error, overcoming the loss, is offered in so simple and inexpensive a device as the "Premier" Burner, making real gas, clean heat, from kerosene?

Write for Information and Circular.

SAN FRANCISCO

San Francisco, October 9, 1918.

WHEAT.

Wheat is selling at the prices announced by the Federal Grain Corporation, and these prices will doubtless be maintained for the present crop. The prices quoted are for grain f. o. b. San Francisco, Los Angeles, Seattle, Tacoma and Portland, and guaranteed at least $2 per bushel f. o. b. shipping point. The price of sacks and sacking not included.

No. 1 hard........$2.20
No. 2 .... 2.17
No. 3 .... 2.13
No. 1 soft........ 2.18
No. 2 .... 2.15
No. 3 .... 2.11
Club or Sonora, No. 1........ 2.16
do, No. 2........ 2.13
do, No. 2........ 2.09

BARLEY.

Barley continues weak, although the price of choice feed has been but slightly lowered. A small amount of choice brewing barley standard was sold this week at $2.25.

Choice feed, per ctl........$2.10@2.15

OATS.

Oats are stagnant. The top price has been maintained, but the range has been increased in feed oats to stimulate movement.

Red feed, per ctl........$2.40@2.55
Red seed .... 2.90@3.10

CORN.

There is still a little of the old California crop in odd lots. The demand is almost nil and $4 was the top price at which any movement was started. Milo maize and Egyptian are nominally unchanged.

(First-hand prices on strictly first-class grain, San Francisco.)

California sacked ....$3.90@4.00
Milo maize .... 3.95@4.05
Egyptian .... 4.05@4.10

HAY.

The receipts of hay for the past week were 764 tons, compared to 934 the previous week. Practically all the hay received had been out in the recent rains and was more or less damaged. There has been practically no market during the week, as wet hay has been sold in accordance to the amount of damage shown.

Wheat No. 1 ....$24.00@26.00
do, No. 2........ 21.0@23.00
Choice tame oat........ 25.00@27.00
Wild oat, new........ 19.00@23.00

do, second cutting........ 22.00@24.00
Stock .... 18.00@21.00
Barley straw ....50@80c

FEEDSTUFFS.

Rolled barley and rolled oats were lower in response to the weakness shown in the whole grain. The entire market is weak. Reports from country districts state that grass has never been known to be in finer condition at this time of the year. Ranges resemble springtime. This is having a depressing effect on the feedstuff market.

New alfalfa meal, per ton.....$34.00@35.00
Cocoanut cake or meal........ 45.50
Cracked corn .... 86.00@88.00

Rolled oats .... 56.00@57.00
Bran, carload lots in S. F.... 23.75
Mixed feed, do, do........ 25.00
Middlings, do, do........ 25.75

POTATOES, ONIONS, ETC.

Potatoes and onions were lower owing to the ample supplies and somewhat restricted demand. While some onions sold as low as 90c, they were mostly "off" stock. A quiet market for both these descriptions is looked for during the next few weeks. Beans came in in good quantity this week and sold below last week's quotations. Lettuce is again plentiful and 15c was about the top price. Cucumbers have advanced.

Peas ....Nominal
String beans ....4@6c
Garden beans ....6@7c
Wax beans, per lb........5@6c
Carrots, per sack........85c@$1.00
Rhubarb, San Jose per box.....$1.00@1.25

Mexican Reds .... 7.25@7.40
Tepary beans .... 7.00@7.50
Garbanzos .... 8.00@8.75
Large whites, new crop .... 9.40@9.75

POULTRY.

There was something of a slump in the poultry market this week, especially in fryers and roosters. Turkeys sold at a higher price and squabs advanced from 5c to 8c a pound. The State receipts were up to the mark and three cars are reported to have arrived from the East.

Turkeys, live, young spring, lb....38@40c

do, old ....25@27c
Belgian hares ....18@20c
Jack rabbits ....$1.50@3.00

BUTTER.

Butter was weaker on larger receipts, after the first day's advance to 68c. A slight reaction occurred at the end and extra closed at 63c. A demand for prime first advanced that description 6c from its last quotations. It almost immediately reacted one cent, but closed only 2c below extra.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extra	68	67	64	62	63	63
Prime first	—	—	62	61	61	61
Firsts			Nominal			

EGGS.

Extra eggs reacted with the slump in butter, going down 2c from the high mark. Small arrivals, however, immediately strengthened the market and it reacted to the high point at the close. On the close there was not enough extras to make a market and the members turned to extra pullets, which jumped 3½c to 59c on the increased demand.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.

Extra 1sts			Nominal			
Firsts			Nominal			
Extra pullets	56	55½	54	54½	55	59

CHEESE.

The San Francisco Produce Exchange has posted the following notice in reference to cheese: "The call of storage cheese is hereby discontinued until further notice, the call having been reopened only to assist in marketing the cheese held in storage prior to January 1, 1918, in line with the requirements of the Food Administration." It is said that all this cheese has now been cleaned up.

Pomegranates, per box........$1.50

CITRUS FRUITS.

Lemons were stronger on the San Francisco market this week and 50c was added to the selling price of each description. Oranges and grapefruit continue strong, and, although they are expected to go higher, no change in quotations is made this week.

Oranges ....$7.50@8.50
Lemons, fancy .... 4.50@5.50
do, choice .... 4.00@4.50
do, standard .... 3.50@4.00
Grapefruit .... 5.50@7.00

DRIED FRUITS.

In addition to taking over the entire prune crop for 1918 in California, the Government has commandeered the Oregon prune crop of 40-90s for this year. Its action regarding prunes has caused an advance in the price of apples and pears. Buyers are now paying the growers 14c to 15c for dried apples and 12c to 15c for dried pears.

RICE.

The first sales of paddy will probably be postponed until next week on account of October 12 being a legal holiday.

Paddy rice, 1918 crop........$4.32
Clear No. 1, 1918 crop, at mill........ 7.00

HONEY.

The honey crop is said to be pretty well out of first hands now and except for odd lots there will be little more buying this season from beemen. It is reported that a considerable quantity of honey is held in storage by some of the dealers of this city.

THE MARKET REPORTS

Figures Given are Independent and Reliable.
Prices Quoted as Paid to Producers.

Special Deciduous Market Report

By J. L. Nagle.

Sacramento, October 8, 1918.

Tokays shipped since the rain have in a great many instances been showing up ripe and watery and prices realized for this stock ranged considerably lower than Tokays that arrived sound. A few cars of Tokays that were shipped East by express brought unusualy high prices.

Malagas have been selling to decidedly good advantage and most of the stock has been arriving in good condition.

The movement of Emperors had hardly begun when shipments were curtailed on account of the weather. A few cars have been shipped East for storage purposes, but a large percentage of the stock has been sold at private sale. Possibly 50 per cent of the Emperors this year that ordinarily would be packed in sawdust will be shipped in lugs, and the trade seems to have taken kindly to this package, though it is not as suitable for reshipment as the drum or keg.

A few cars of late winter pears will move this week, which will clean up the tree fruit season, with the possible exception of some Santa Clara Anjous and Winter Nellis.

It is reported that a few thousand barrels of Spanish Almerias are en route to New York. It is predicted, however, that the importation of this variety will be extremely light this year and we look for an unusually strong and high market on late grapes if the stock arrives in good condition.

Averages for the week:

New York: Grapes—Zinfandel, $1.88; Alicante Bouchet, $2.36; Mission, $2; Malaga, $2.16; Cornichon, $2.38; Tokay, $2.27; Muscat, $1.88; Emperors, $3.23. Pears—Bartlett, $3.67; B. Hardy, $3.62; Winter Nellis, $3.18; B. Clairgeau, $3.70. Peaches—Phillip Cling, $1.60; Levi, $1.68.

Boston: Grapes—Tokay, $2.36; Malaga, $2.08; Black Prince, $1.92; Alicante Bouchet, $1.62; Zinfandel, $1.42; Muscat, $1.75; Mission, $1.50; Cornichon, $2.57. Pears—Bartlett, $4.11; B. Hardy, $4.08; B. Clairgeau, $4.57. Peaches—Levi Clings, $1.70.

Chicago: Grapes—Cornichon, $2.28; Malaga, $1.85; Tokay, $1.95; Emperors, $3.14; Muscat, $1.75. Pears—Bartlett, $3.45. Peaches—Levi, $1.65.

Shipments from September 27 to October 4, inclusive (incomplete): 4 peaches, 63 pears, 1691 grapes. Total shipments to date, 1918: 18,255 cars. Total shipments to date, 1917: 16,905 cars.

Special Citrus Market Report

San Francisco, October 8, 1918.

The quality of the offerings of California oranges this week was of the highest, so with a strong demand for the fruit from the hospitals and a steady call from the U. S. Quartermaster's Department prices ruled high. In the auction market prices ranged from $6 for poorer grades of fruit to $11.55 for the best. F. o. b. quotations were on the basis of $7.50 to $8, according to sizes. About 300 to 350 cars of Valencias remain to be shipped, but they will be cleaned up at good prices before the Florida oranges arrive in quantity. The new crop in Southern California gives promise of early shipments in some sections. In Central California the best districts will produce 40 per cent of normal crop, but elsewhere estimates are placed at 25 per cent. Sizes will run large owing to the short crop.

California lemons are again in demand. The foreign lemons have been cleaned up and the new crop from abroad will probably not arrive before December. Supplies of old stock in storage are exhausted, but all lemon houses have an accumulation of sweated fruit owing to recent low market conditions. F. o. b. quotations are on the basis of $4.

The total shipments of citrus fruits from Southern California for the season are: Oranges, 13,944 boxes; last season, 38,907. Total shipments of lemons this season, 5606 boxes, last season, 7536.

LOS ANGELES

Los Angeles, October 8, 1918.

BUTTER.

This market reached the high point of the year the past week and lost the advance before the close of the week. Receipts for the week were 255,400 pounds, against 294,700 pounds the same week last year. This shortage in the supply and sharp advance in San Francisco the early part of our review week caused dealers on 'change to bid extras up Wednesday to 60c, and this price was maintained up to Saturday. There was withdrawn from cold storage during the week to meet this shortage in fresh receipts 62,736 pounds, against 4040 pounds the same week last year.

We quote:

California extra creamery........58c
do, prime first 56c

Extra	58	60	60	60	60	58
1917—						
Extra	46	46	46	46	46	46

EGGS.

Continued scarcity of fresh stock caused a firm and fairly active market the past week for all fresh receipts, and the high prices caused the trade to use cold storage more freely. The receipts of fresh eggs by railroad for the week were 419 cases, against 527 cases the same week last year. The receipts by truck were 2090 cases, against 2635 cases the same week last year. There was withdrawn from cold storage during the week 3425 cases, against 5141 cases the same week last year.

Daily quotations:

POULTRY.

The market was hardly so strong on fryers and hens. Broilers were in lighter supply and were in fair demand and sold up 2c. Turkeys in good demand and the market for young toms firm. Ducks quiet but steady. Geese dull.

The following prices were agreed upon last Friday, October 4, and hold good until the coming Friday:

Broilers, 1@1¼ lbs........37c
Broilers, 1½@1¾ lbs........37c
Fryers, 2@3 lbs........31c
Roasters (soft bone), 3 lbs. and up....31c
Stags and old roosters, lb........20c
Hens ....26@30c
Tom turkeys ....32@35c
Ducks ....22@28c
Geese 15c

VEGETABLES.

Potatoes were slow sale and lower, coming in more freely and the trade not inclined to stock up. Onions were also dull and a little lower. String beans slow sale and weak, while lima beans were dull and lower. Sweet potatoes off a little and continue to drag. Celery coming in more freely and slow sale and lower. Cabbage dull and lower. No shipping demand; local sales light.

We quote from growers:

Bell peppers, per lb........2½@3c
Chile peppers, per lb........2½@3c
String beans, per lb........4@4½c
Lima beans ....4@5c
Potatoes, local, per lug........75c@85c

Onions, White Globe, per cwt........1.75@2.00
Cabbage, per 100 lbs........1.75
Celery, crate ....3.00@3.25

FRUITS.

All good fresh stock in good demand. Apples steady at last week's prices. No. 1 pears and peaches continue to sell fairly well. Grapes in good supply, and demand good. Most of the offerings from nearby. Figs slow sale and lower. Quinces steady and in fair demand. Some Japanese persimmons now coming in, but selling slow.

We quote from growers:

Figs, Black Spanish, 7 lb. box........30@40c
do, White, 7-lb. box........30@40c
Peaches, freestone, per lug........$1.00@1.25
do, clings, per lug........ 1.25@1.50
Pears, local, per lb........2@3c
Pears, Mountain ....3½@4c
Grapes—

do, Bellefleurs, local, per lb........2@2½c
Avocado pears, small, per doz....50c@$2.00
do, large, per doz........$4.00@7.00
Quinces, lug ....75@85c
Japanese persimmons, per lb........6@7c

WALNUTS.

Some few were delivered the past week, the first of the season. So strong was the demand despite the high prices named, that they were advanced 2c all around and held firm at this improvement. We quote f. o. b. California points:

	1918	1917
Fancy budded	33½c	24c
Standard budded	31c	21c
No. 1 soft shell	30c	20c
No. 2 soft shell	27c	15½c

BERRIES.

Fancy strawberries were sharply higher and raspberries and blackberries were firm at quotations. Demand only fair at the high prices.

HOW DO YOU FEEL ABOUT IT?

Frankly, how do you like the Rural Press nowadays? How does it meet your needs? How does it compare with other farm papers? How do you like the improvements we are making? Here is what one subscriber thinks about it, and he ought to be able to judge the real value of the paper, for he is none other than Mr. Luke Powell, the well-known District Horticulturist of Prosser, Wash. He says:

"Working on a salary that cannot be increased because of State laws, and with living expenses advanced, I feel that I can hardly afford to keep up the subscription of your valuable paper, yet if I am going to stay in this line of work I do not see how I can afford to be without it. There are farm papers that are real, and there are farm papers that are impostors, and I sincerely hope that the Government or somebody will put such a conscription on printers' paper that these junk farm papers that are full of advertising and poor information will have to go out of business. They are irresponsible and full of irresponsible dope. This may sound a little erratic, but if it were possible I would have every farm paper passed on by a board of censors and then require every farmer to take one or more of these papers and spend so much time each day reading them. My work puts me in personal touch with the ranchers, and I can tell you the ones who read and the ones who do not read; also those who read good farm papers and those who read "junk." Your paper is one that has done me a great deal of good, although your pen is pretty sharp sometimes. However, you are keeping in close touch with the California growers on the different conditions that exist in your State, and I have often wished that we had such a paper in our own State of Washington."

We thank Mr. Powell, and now how about you? Is the paper just as valuable to you in your line of work? If so, won't you tell us about it? Of course, our marvelous growth is convincing proof that the paper is giving satisfaction, but we who edit it are human, and we like to have our heart-strings touched by letters from those who have been helped. We value them more than our salary checks. They are our highest reward. What have you to say?

Strawberries—
Fancy paper 30-basket crate....$3.50@3.75
Poor to choice, 30-basket crate. 1.50@1.65
Blackberries, 30-basket crate.... 2.50@3.00
Raspberries, 30-basket crate..... 3.50@4.00

MELONS.

As the weather was cool most of the week, the market was dull for watermelons and casabas. Quality falling off. Cantaloupes about out of season. Honeydew melons dull and a little lower. Offerings poor.

We quote from growers:
Casabas, per lb.....................1@1½
Watermelons, per 100 lbs........75c@$1.00
Honeydew melons, 16-inch crate.75c@$1.00
do, jumbo crate ....$2.75@3.00

BEANS.

The market continues quiet. What demand there was was mainly confined to limas and blackeyes, which sold fairly at steady prices. There was also some little doing in pinks at quotations. Teparies dull and lower. Small and large whites neglected.

Limas, per cwt......................$11.50
Large white, per cwt................ 10.00
Small white, per cwt................ 10.00
Pink, per cwt........................ 7.50
Blackeye, per cwt.................... 6.25
Tepary, per cwt...................... 7.50

HAY.

The market the past week was duller than ever. Not much in, but very little wanted. Prices were lowered $1 a ton all around. Still buyers took hold in a limited way.

We quote f. o. b. Los Angeles:
Barley hay, per ton..........$23.00@24.00
Oat hay, per ton............... 25.00@27.00
Alfalfa, northern, per ton..... 20.00@21.00
Alfalfa, local, per ton.......... 21.00@23.00
Straw, per ton .... 9.00@10.00

Special Livestock Market Report

San Francisco, October 9, 1918.

CATTLE—Cattle of good weight and quality are becoming scarce, with a good probability of higher prices soon for this kind of stock. Several large lots from Oregon were recently shipped into this market.

Grass steers—
No. 1, weighing 1000 to 1200 lbs..11½@12c
No. 1, weighing 1200 to 1400 lbs.11½@11¾c
Second quality ....10@10½c
Thin ....8@9c
Cows and heifers—
No. 1 ....7½@8c
Second quality ....6½@7c
Common to thin......................4@5c
Bulls and stags—
Good ....6@7c
Fair ....5@6c
Thin ....4@5c
Calves—
Lightweight 11c
Heavy 8½c
Medium 10c

SHEEP—There is little or no change in the sheep and lamb situation. Owing to the relatively high prices asked for mutton, the consumptive demand is so limited as to be easily supplied.

Lambs—
Yearlings ....12@12½c
Milk ....14@14½c
Sheep—
Wethers ....11½@12c
Ewes ....9@9½c

HOGS The hog market is down again. This is largely due to the decline in the Eastern markets. The quality of those marketed, however, continues to be good.

Hogs -
140 to 300 lbs.........................17¾c
300 to 400 lbs.........................17¼c
100 to 140 lbs.........................17¼c

Los Angeles, October 8, 1918.

CATTLE—A fair market was had for choice fed steers; few coming in. Thin and medium cattle are still dull.

Per cwt. f. o. b. Los Angeles—
Beef steers, 1000 to 1100 lbs....$9.00@12.00
Prime cows and heifers........ 7.50@ 8.50
Good cows and heifers.......... 7.00@ 7.50
Canners, per cwt.............. 5.00@ 5.50
Calves, per cwt................ 8.50@ 9.50

HOGS—In sympathy with declining markets in the Central West, brought about by a sharp decline in corn, the market here the past week showed weakness and killers withdrew the premium they were paying for choice offerings. They are still paying quotations, however, for good hogs. Market shows a downward tendency.

Per cwt. f. o. b. Los Angeles:
Heavy, averaging 275@300 lbs..$15.50@16.50
Mixed, 225x275 lbs............ 16.00@17.00
Light, 175@220 lbs............ 16.50@18.00

Rough docked 20 lbs., piggy sows 40 lbs. and stags 40 per cent.

SHEEP—But few choice sheep and lambs are to be had and they are bringing steady prices. Thin and medium stuff is dull and weak.

Per cwt. f. o. b. Los Angeles—
Prime wethers ....$9.00@10.00
Prime ewes .... 8.50@ 9.50
Yearlings .... 9.50@10.50
Lambs .... 15.00@16.00

Portland, October 8, 1918.

CATTLE—Steady; receipts, 179. Steers, prime, $12.50@13.00; medium to good, $9.75@11.00; good to choice, $11.00@12.00; fair to medium, $8.25@9.25; common to fair, $5.75@8.25; cows and heifers, choice, $8.00@9.00; medium to good, $5.75@7.25; fair to medium, $4.75@5.75; canners, $3.00@4.00; bulls, $5.00@7.00; calves, $9.00@12.00; stockers and feeders, $6.00@8.00.

HOGS—Lower; receipts, 471. Prime mixed, $19.25@19.50; medium mixed, $18.75@19.00; rough heavies, $17.25@17.50; pigs, $15.50@16.50; bulk of sales, $18.75@19.00.

SHEEP—Steady; receipts, none. Prime lambs, $12.00@14.00; fair to medium, $9.00@11.00; yearlings, $10.00@11.00; wethers, $9.00@10.00; ewes, $6.50@9.00.

STATEMENT OF THE OWNERSHIP, MANAGEMENT, CIRCULATION, ETC., REQUIRED BY THE ACT OF CONGRESS OF AUGUST 24, 1912,

Of Pacific Rural Press, published weekly at San Francisco, Cal., for October 1, 1918.

State of California, County of San Francisco—ss.

Before me, a Notary Public in and for the State and county aforesaid, personally appeared Frank Honeywell, who, having been duly sworn according to law, deposes and says that he is the publisher of the Pacific Rural Press, and that the following is, to the best of his knowledge and belief, a true statement of the ownership, management (and if a daily paper, the circulation), etc., of the aforesaid publication for the date shown in the above caption, required by the Act of August 24, 1912, embodied in Section 443, Postal Laws and Regulations, printed on the reverse of this form, to wit:

1. That the names and addresses of the publisher, editor, managing editor, and business managers are: Publisher, Frank Honeywell, San Francisco; editor, E. J. Wickson, San Francisco; managing editor, E. J. Wickson, San Francisco; business manager, Frank Honeywell, San Francisco.

2. That the owners are: (Give names and addresses of individual owners, or, if a corporation, give its name and the names and addresses of stockholders owning or holding 1 per cent or more of the total amount of stock.) Frank Honeywell, San Francisco, Cal.

3. That the known bondholders, mortgagees, and other security holders owning or holding 1 per cent or more of total amount of bonds, mortgages, or other securities are: (If there are none, so state.) None.

4. That the two paragraphs next above, giving the names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company but also, in cases where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear upon the books of the company as trustees, hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds, or other securities than as so stated by him.

5. That the average number of copies of each issue of this publication sold or distributed, through the mails or otherwise, to paid subscribers during the six months preceding the date shown above is .... (This information is required from daily publications only.) FRANK HONEYWELL.

Sworn to and subscribed before me this 30th day of September, 1918.

(Seal) H. F. HOBSON,
Notary Public in and for the City and County of San Francisco and State of California.

"Can I get as many eggs from my hens as I should?"

Surely!

IF you have not received a copy of the 1918 edition of our handbook—"Makes Hens Happy"—we want you to have one. It is a splendid guidepost to success in the poultry business; and no one knows so much about poultry-raising that he can afford to overlook the big money-saving and money-making suggestions embodied in this booklet.

There has been such a tremendous demand for this booklet, however, that we cannot say how long the supply will last. But—this much we can say: If you fill out the coupon below and mail it today—we will promise to get your copy to you post-haste.

Mail the coupon NOW!

Stock and Poultry Food Department,
SPERRY FLOUR CO.,
150 Weber Ave., Stockton, California.

Gentlemen:

I shall be glad to have a copy of your handbook—"Makes Hens Happy"—which is to be sent to me FREE.

Name .....

Address .....

After all, the problem simmers down to feeding. If you let the hens loll around waiting for *them* to make use of the embryo eggs that are in them—you won't find it very profitable waiting.

You know that Nature provides each laying hen with just so many eggs in embryo. And—if you leave it to Mrs. Hen she will take six or seven years to produce her quota of eggs. And, incidentally, she will leave *you* high and dry—by the time you have paid for her feed and keep all that time. Not much in that—is there?

Your job, then, is to see that the hen produces her *full supply of eggs in two or three years*. And—the biggest part of your job is to see that she gets the proper feed—the balanced ration—she needs to give you the best (and the most) that's in her.

Quite a problem—you say? It is—if you waste a lot of time, money and energy experimenting with hand-mixed feeds and mashes. But it isn't—and it won't be—if you do what thousands of successful poultrymen are doing today: if you bank on Surelay.

Surelay contains *sixteen* distinct ingredients that every hen in your flock needs to make her a profit-producer. It is made so good, so wholesome, so tasty, that every time Mrs. Hen takes a peck of Surelay she is eating a little of everything that goes to make up an egg.

There is nothing mysterious about Surelay—or what it will do. You know what to expect of it—day in and day out. You know that it contains just the proper proportion of *protein* for the white—just the right amount of *fat* for the yolk—just enough *lime* for the shell.

And, what's more, we make no secret of it. You will find its analysis printed on the back of every sack. And remember: what's *on* the sack is *in* the sack, and that's what makes the *eggs*.

So—what's the use of bothering with hand-mixed feeds that are only guesswork at the very best? Where's the dollars-and-sense? Why not "cash in" on the experience of countless poultrymen who have found that Surelay—a uniform, high-grade, perfect-balanced ration—is *always* the most economical, convenient and dependable feed you can use?

[Be sure to look in your Surelay sack for the Certificate that entitles you to our 1919 Surelay Egg Record and Calendar]

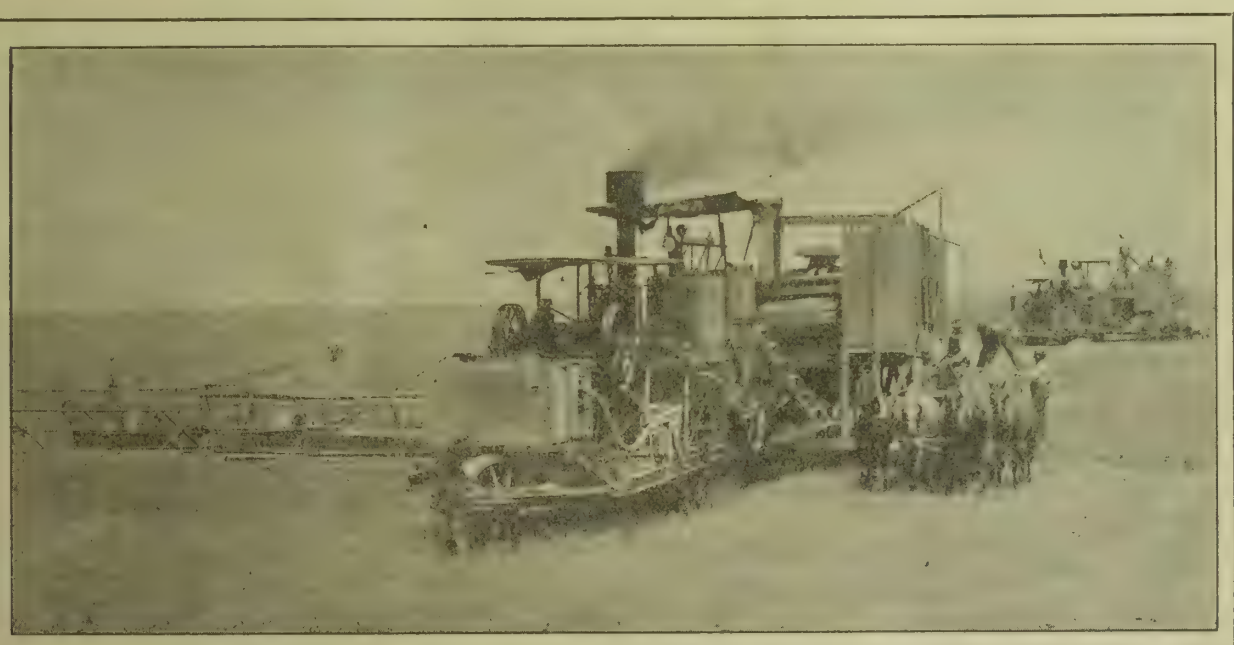
The 1919 Wheat Crop Will Be Increased

Written for Pacific Rural Press by R. E. Hodges

WHEN the hare and the turtle were racing to reach a certain goal first, the hare thought he had a cinch when he came in sight of the end. So he went to sleep on the job and the turtle beat him to it. The war is not yet won and we are not so hare-brained as to go to sleep on the job. We want our boys to keep the Huns a-running and we will have to give them several grains of wheat for every bullet we want them to shoot. California's apportionment for 1919 is 538,000 acres of wheat, an increase of 122,000 over last year, as stated in outlines of the project which all Farm Bureaus in the State are pushing. There are plenty of reasons why we should put up that increase, including the certainty of profit from a fair yield, but the good feature of it is that even so early in the season as October 1 the gain is practically assured. This glorious fact we get not alone from our own interviews with wheat growers and local warehouse and elevator men, but while reports from the 475 Farm Bureau centers are not ready for tabulation those that are indicate an overwhelming increase in practically every county. Not so overwhelming with relation to the total grain acreage, but surely so when we consider that wheat growing has of late years steadily declined in California due to its relative unprofitableness.



Combined harvester cutting and threshing grain in bulk on Moreing Bros.' ranch in Sacramento county. Notice the improvised wooden bin on the side which receives grain that would otherwise be sacked at great additional labor. The horses were replaced by motor trucks for the 1918 harvest. Bulk harvesting saved 65 men's labor on this ranch alone through the harvest period. Men would have cost at least $4 a day if they could have been obtained and kept on the job; which they couldn't.

The most reliable and most definite estimates we are able to get for the probable increased wheat acreage in the various counties is that furnished us by George R. McLeod of the Sperry Flour Co. The efforts of that institution to justify greater wheat acreage in California by introducing varieties that will yield more per acre under our conditions and will be worth more per cental because of better milling and baking qualities than the varieties commonly grown, have been set forth in the Pacific Rural Press at various times.

Mr. McLeod says that with anything like a normal season this fall and winter, an increase of 125,000 acres is already assured, and he thinks it will be nearer 175,000 acres. Here is the way he estimates in general round numbers that the various counties will accomplish the increase: San Joaquin county, 15,000 acres more than last year; Stanislaus, 10,000; Madera, 7500; Fresno, 10,000; Kern, 10,000; Imperial, 10,000; San Luis Obispo, 5000; Monterey, 10,000; Contra Costa, 7000; Yolo, 10,000; Colusa, 10,000; Glenn, 5000; Tehama, 5000; Butte, 10,000; Sutter, 10,000; Sacramento, 7000. The final plantings may easily vary considerably from these figures, especially in the northern Sacramento Valley, and there may be smaller increases in the grain counties not mentioned. Merced county people are figuring on a big increase, while Tulare and Kings will not be left out.

Already enough of the new wheat, Early Baart, alone has been sold to plant 50,000 acres, mostly in the Sacramento and San Joaquin valleys. A great many large tracts of land that have been in pasture for a decade or more are laid out and partly plowed for wheat. Barley growers are planning in a large way to sow wheat instead of barley—even though they have not grown wheat at all for many years. For several days the Sperry Flour Co. sold seed wheat enough every day to plant 2000 to 3000 acres for people in one district who had grown only barley before. Rice land in great areas will be planted to wheat, especially where watergrass has become troublesome. One outfit in Butte county expects to change 3500 acres of rice land to wheat, largely on the principle that leaving water off the land occasionally will secure better crops of both rice and wheat.

Use Best Seed Wheat.

Ninety per cent of California wheat is of mixed varieties, cross-bred, or hybridized. That is one prime reason why we are not getting good acre-yields. It is also probably the greatest reason why milling and baking tests show that California wheat has been deteriorating. If by paying $1 per acre more for seed you get a sack more per acre of wheat, you have made profits that would look like profiteering in any other business.

"No one variety of wheat is likely to turn the State upside down," says Mr. McLeod. "We believe in using in large acreages only those varieties that have proved best adapted to each district, considering both average yield and market value. But whatever variety is favored, be sure to plant only that seed which is truest to type for that variety.

Early Baart Wheat.

No variety in the past two decades at least has sprung into such widespread enthusiastic popularity, however, as the Early Baart, which was grown more extensively last season throughout the central valley of the State. Wherever it was grown, neighbors have generally bought the crop for seed until the Sperry people have had to get their stocks of seed from Washington and Arizona.

Early Baart is not one of the two or three dozen varieties obtained by the Sperry Flour Co. from the Australian exhibit at the Panama-Pacific, but its value was quickly realized when a field of it was found two or three years ago in Modoc county. This variety had been introduced to Arizona from Australia ten or twelve years ago to give life to a dying wheat industry in that State. It has replaced practically all other wheats there, and Prof. George F. Freeman, plant breeder of the University of Arizona, who introduced it, says that he has grown 67 bushels per acre on plots of an acre or larger, and he sees no reason why the average for that State should not be 40 or 45 bushels.

A few years ago some mustard seed were scattered along railroad rights of way in Washington State from Oriental shipments being carried across on "Jim" Hill's railways. This "Jim Hill" mustard took possession of wheat fields until growers began search for a variety that would survive the mustard. They found such a variety in the Early Baart, then grown in the United States only in Arizona. It not only got ahead of the mustard, but produced as well or better than Bluestem commonly had, and sold two to three cents higher, until all No. 1 Hard White wheats were valued at one price by the Food Administration. That is why so much of our Early Baart wheat seed is coming from Washington this fall, and that is why there is enough to supply all demands.

EDITORIALS

THE WAR IS TO GO ON.

AS WE write on Tuesday there comes President Wilson's declaration, in answer to the German plea for an armistice, that the war must go on until it reaches its only real terminal—the guarantee of world peace beyond all possibility that those who are now outraging it shall ever repeat the offense. To this end it is necessary that the German people shall bind themselves over to keep the peace and to repair the damages they have wrought and therefore no international talk about peace can be arranged until the world is sure that it hears the voice of the German people and not the ventriloquism of its lying and murdering overlords. The war is in its last stages, but it must not end until it ends right. This is the declaration of the American people and it is the duty of every citizen of this country to "carry on" with doubled energy of purpose and doubled generosity of contribution toward the realization of that purpose. The War Department at Washington announces that a quarter of a million American soldiers will continue to embark every month for France until the American objective, world freedom and self-government of all peoples, is actually attained. Your country never needed your money more than it needs it now! A great, beneficent victory is in sight. If you cannot be able in coming years to put on your old uniform to show your grandchildren what you did for your country, you can surely arrange to tell them how your money went to war and helped those who were privileged to wear the honored insignia of their country! It will be the greatest joy of your declining years. Do not neglect the present opportunity. As a victory which will insure world peace is now in sight, thank God and buy more Liberty Bonds! It may be your last chance, in connection with this supreme effort of your country, to demonstrate your right to cry out to all mankind: "I am an American!"

WILL THERE BE ROOM IN HELL?

TO THE EDITOR: What do you think of this resolution of the labor unions at their San Diego assembly? The brave soldiers to be kept in Europe so unionists can get high wages after peace comes! To hell with the unions!—Patriot, San Francisco.

We do not agree with our correspondent's consignment of the labor unions to the apartments already engaged by the U. S. Marines for the kaiser and his satellites. When the Teutonic autocrats and their dupes, the Russian anarchists, and their imitators, the American anarchists, reach that steam-heated summer resort there will be no room for the labor unions. Besides, we have no sympathy at all with the idea that the unions, as such, merit any such condemnation. In their organization to serve their purposes of securing their rights as they conceive them, the unions are not only within their rights but they are an example to other elements of the producing class. They have as a whole exerted a great patriotic influence during the present war. No one can tell what a hell of anarchy we might have been in in this country if our laboring men had been unorganized and open to the perversion of American bolsheviki. The few failures which labor leaders have made in patriotic direction of their constituencies indicate very clearly what we might have experienced if there had been no such leadership at all. Therefore, we are very glad that they are not entitled to consignment to the kaiser's crowded future state and very thankful for what they have done to push him and his hirelings in this country toward that destination.

AN ABHORRENT IDEA.

BUT though we claim that labor unions have a right to exist without consignment to perdition, we quite agree with the main contention of our correspondent that some of their transactions and declarations are abhorrent—and "unfair," which is, we believe, the worst word in their institutional vocabulary. The resolution to which our correspondent especially refers urges—that after the war the soldiers be returned to their homes gradually, and in numbers so they can be assimilated without an upheaval of industrial conditions.

The resolution was referred to a special committee of seven for further consideration and action, "to the end that some sane solution may be devised to maintain the equilibrium of our movement and safeguard the interests of the boys when they return from over there."

Such a resolution is really outrageous and unworthy of consideration by any American organization. It should have been stamped upon by the resolutions committee and denied discussion and publication. Think of the world service these boy heroes of ours have rendered and the sacrifices they have made: think of their longings for their homes and the return to the embraces of the millions who have given them to danger and to death because there are human purposes attainment of which transcends all emotions of personal love and kinship! Who can for a moment think of such things and of the merited reward to which service of sons and sacrifice of parents give just title in the return of these noble youths immediately upon the completion of their patriotic tasks, and view with any tolerance the proposition that our soldiers be held abroad intentionally for the sake of a wage scale for the stay-at-homes and the enforcement of a six-hour day at wages which now prevail! That is what they propose to demand.

It is a fact, of course, that our soldiers' foreign job is not complete: it is true also that they cannot all return at once when it is complete, but neither fact justifies the abominable effort to protract their exile and deny their right to enter as soon as possible upon the building of American lives to which they were born and upon the success of which all their families await with longing love and upon which many of them are directly dependent for comfort and support! We are not surprised that our correspondent consigns the organizations authorizing such a proposition to perdition. He is, however, wrong in that, though he is perfectly right in this: the idea is hell-born and should return hither!

THE UNFAIRNESS OF IT.

WE WILL not emphasize the argument that any American workingman who urges the Government to keep American soldiers abroad at $30 or less per month so that he can be secure in possession of $30 or more per week is unfair and undemocratic. Nor will we push the personal argument that if he does so he is merely carrying out the historic policy of his organization when it called upon fathers to make cigar-stand statues of their sons because they were forbidden to make apprentices of them in their own trades. It is, however, unavoidable to say that those who favored that resolution at San Diego did what they could to rob their own sons and brothers of the chance of selling their time for wages which they fix for themselves and they rob them of their best years in qualifying themselves to get the rewards of master workmen in the vocations which they choose. It is questionable whether the kaiser himself could plan a more ingenious debasement and punishment for the American soldier. And then, why is the kaiser deporting Belgians and Alsatians? Obviously it is "so they can be assimilated without an upheaval of industrial conditions." Deport Americans so they will not upset America! There is surely some excuse for the rage of our correspondent.

But the unfairness of the San Diego resolution is broader even than that because it aims to undermine the whole producing prosperity of this country. It is only in time of war, when prices are not measures of intrinsic value or serviceability but simply mortgages upon the industry of the future, that such wages as are now being paid are possible. The continuation of such wages will make the whole country hungry and ragged and poverty stricken, because none can pay them and therefore none can get them. To plan, therefore, to perpetuate such wages is not only unpatriotic, because they will arrest the development and destroy the prosperity of the country, it is also industrially suicidal to all who make such plans and hope by reducing the labor supply to carry them out. After the war we shall need more active capital, more materials, more labor. Every agency must do its best to recompense the direct cost, the indirect waste and the deficiency of everything which naturally results from killing people in such colossally expensive ways. Every product must go to the consumer on a fair basis of cost of production and fair profit thereupon for all who contribute thereto. In this way alone can the world regain its wasted wealth. Any enterprise or undertaking which plans otherwise is unfair and merits public condemnation.

TOO MANY TEMPLES.

WE HAVE admitted that the labor organizations are not only within their rights in organizing but are in this respect an example for other elements of the producing class. Our arraignment of some policies of the labor organizations does not reduce our admiration of the way they tackle their job of having their own way—so far as they can. It is up to other people to determine how far they shall have it—but in trying to get it they are surely an example and in showing other people how not to try they are also exemplary. In our issue of September 28 we outlined a movement by the National Board of Farm Organizations to secure a "Temple of Agriculture" in the national capital which should serve as "a national headquarters for the organized farmers of America." Since then we have received a copy of the "Farmers' Open Forum," an interesting journal published by the Associated Progressive Farm Organizations. Why the journal should be called the "open forum" we do not know, for all the fora we ever saw or heard of were the most open and draughty places in the world. But that does not matter. What strikes us as significant is that the journal claims that its forum is a good enough temple and that the business of its association is to foregather all the headquarters of American farmers and has been for the last eight years. It so happens, however, for what reason we do not know, that the "National Board of Farm Organizations" does not desire to worship in the forum of the "Associated Progressive Farm Organizations," but proposes to build a temple of its own. This fact is illustrative of all our previous efforts at really national organization of agriculture in this country. We have never been able to get together. Whenever one bunch of farmers digs out a forum another bunch builds a temple, and so we have a cellar in one place and a superstructure in another and no power on earth has so far been able to put the superstructure over the cellar. What will come of it in this latest instance we shall have to wait to see. The problem now being discussed does, however, give us fuller knowledge of what federated labor does when it comes up to the question of representation in places where laws are made and national policies determined. The Open Forum in the course of pouring cold water upon the head of its rival organization says this:

To talk of a Temple of Agriculture at Washington at this time, except as a goal to be achieved in the future after many preliminary achievements, is worse than folly. The Federation of Labor, before building its Labor Temple, had maintained labor headquarters for many years, and had overrun several entire floors of a large office building. They had, in fact, reached a point where the saving of office rentals alone would pay good interest on the capital required to build the temple. Last year the Federation of Labor expended $400,000 on its work in Washington. It had use

for every room in the temple before the architect's plans for the building were even drafted.

The significant facts are that when labor organizations set out to put something over they do not scrap in the forum or in the temple but do all their scrapping in the catacombs, and when they are ready to get something there is nothing to be seen or heard but a garlanded procession for Pennsylvania avenue, a sweet low chorus for the whispering gallery of the White House, and soon after there is a walking delegate on every national excursion which Uncle Sam issues tickets for! There will be a "labor representative" on the peace plenipotentiary bunch which will be sailing before long. How many farmers will there be? Not one: they will all be too busy sweeping out the forum or whitewashing the temple after a joyful time throwing mud and rocks at each other.

QUERIES AND REPLIES

By the Editor.

Inquirer Must Give Full Name and Address.

Summer Cropping Not Summer Fallow.

To the Editor: Do you consider a piece of land, that has raised and matured a crop of gyp corn, summer fallow? I am asking to help clear up a matter of land rental.—R. F., Stockton.

Summer cropping is not summer fallow. It is true that the growing of a crop of clover or other legume is called in humid climates a "covered fallow" if the crop is plowed under in the fall before seeding to grain, but taking off a summer crop is no kind of a fallow. In California the only thing which is called a fallow is a "bare fallow," for which the land is worked several times and nothing is allowed to grow. The chief value in a bare fallow, in our climate, is conservation of moisture—storing up all you can of two years' rainfall to grow one crop. There are minor advantages in the several cultivations and in cleaning the land by not allowing weeds to go to seed and these would be probably largely gained by growing a summer crop of gyp corn, for instance, but the chief advantage, that of storing moisture in the soil, would be lost because the moisture is used up by the summer crop. For this reason, perhaps, growing such a summer crop is sometimes called a "half fallow"—but strictly, from a California point of view, it is no fallow at all.

Grains for Winter Feeding.

To the Editor: We have four acres facing south. After the recent rain we plowed it and put in barley, which we intend to cut green for the cows. Alfalfa hay is high in price and very poor in quality. Can we get two crops? Will it be too late to put in red oats and vetch or cow peas? We have no water and the place is hilly.—S. M., San Francisco.

If you cut the barley early enough in its green growth, you will get a considerable second growth. Cutting forward as needed for the cows (if you do not have too many of them) will enable you to cut second growth in the same way later. Then you can plow and resow about next March with oats and vetch as you propose. Common talk, however, is that common vetch seed is shy, and those who can supply it ought to be advertising that fact right now. When the ground becomes warm in March you can probably sow cow peas with the oats instead of vetches, because on the San Francisco hills there is little danger of spring frosts to kill them. Or you can get a lot of corn fodder if spring rains are normal.

How About Barley?

To the Editor: Can you tell us anything more about the chances of selling our barley?—R., Sacramento.

We have seen a report that the California committee which went to Washington to tell Hoover about it has returned with a little better feeling. There seems to be little show at present to move barley profitably to the East, for it is reporting selling at New York at $1.15 per bushel. Some encouragement seems to have been given by Mr. Hoover and Mr. Barnes of the Grain Corporation "that there might be an opportunity to get some tonnage later at San Francisco and that some barley might be bought for the allies fairly in competition with other barley and that the probable movement thus of the limited amount would relieve the California situation." This seems to be at present the chief hope of disposing of our surplus beyond local feeding requirements, although the Food Administration would like the millers to flour more barley and will do what they can to secure relief in that way.

Reclaiming Dried Fruit.

To the Editor: Neglected dried fruit of the crop of 1917 became slightly wormy and was treated with carbon bisulphide in the usual manner—a saucerful on top in a tight container, with the fruit in bags on the bottom—left two days, when bugs were dead and easily brushed out. Do you think such fruit is injurious to use from the bisulphide gas? It is bright, nice fruit.—L. G., Sacramento.

Bisulphide treatment does not injure the fruit in any way. If properly exposed to the air (in a screened room, so that no egg-laying moths can gain access to it) evaporation of the vapor is complete and the fruit will remain good if still protected from new infestation. The treatment with the vapor which you gave was unnecessarily extended; a few hours is ample.

The Tree Malva.

To the Editor: Mention has been made several times this summer in the Rural Press in regard to the "tree malva" or "lavatera." Will you kindly inform me whether it is grown from seed and where I can purchase it? I have tried every seed store and nursery in Sacramento, but none are familiar with it.—Reader, Elk Grove.

It is very common with seedsmen in the coast region. We find it in five San Francisco and Los Angeles seed catalogues which we happen to have in hand. Seedsmen nowadays seem too busy to advertise that they have catalogues and collections of all desirable things. In getting lavatera be sure to tell the dealer you desire "tree malva," which grows six to ten feet or more in height, not the lower species, which may have larger flowers. The plants grow very readily from seed.

Hop Crop Refuse for Spinach.

To the Editor: Are well-decayed hop vines valuable substitutes for commercial fertilizer for the spinach family? If so, why?—Subscriber, Brighton.

Hop vines and leaves are very rich in nitrogen, phosphoric acid and potash as compared with other crop wastes and are therefore, when well decomposed, and plowed in early, a valuable complete fertilizer. For the same reason they are a substitute for commercial fertilizers in increasing the general supply of plant food in the soil, though they may be profitably supplemented by light surface dressings of soluble nitrate during the growing season to promote freer leaf growth if the plants should be slow in developing this essential feature of the spinach crop.

Resurrecting Kafir.

To the Editor: I have some kafir corn which has gotten very musty. Is there anything that I can do to make it fit for chicken feed?—Subscriber, Porterville.

It may have become so moldy as to be worthless and possibly dangerous. If only "musty," it can be improved by exposing in a thin layer to air and fall sunshine. The mold can be killed by dipping or sprinkling thoroughly in formaldehyde solution (one pint of 40 per cent formaldehyde to 40 gallons of water), using one gallon to one bushel of grain. When sprinkling, mix the grain well and cover for ten hours and then dry thoroughly, but we doubt if bad kafir is worth the cost of labor and materials.

Two of a Kind.

To the Editor: Your reply to "Investor" in the Rural Press of October 12 is "smart," but I fail to see logic in advising a man to frame up a bunk game for another "sucker." Do you think it honorable, or is it all right as long as it is business?—Disgusted Subscriber.

The logic is all right, but we do not guarantee the morals. We hoped that little iniquity might be overlooked—forgetting the old proverb: "set a thief to catch a thief." We consider ourselves under arrest.

Bonds or Lime?

To the Editor: Kindly tell me which is the more patriotic—to buy a Liberty Bond or invest the money in much-needed lime for the soil? We have not the money to buy both.—S. S. F., Santa Rosa.

Patriotism and Profit

You can combine them by joining us in our campaign to help farmers raise more and better crops. We need more men to attend to our renewals and present the paper to those who are not already subscribers. If you have an automobile, can give us your whole time, and think you can present the merits of the paper in a convincing way, let us hear from you. We have an attractive proposition. Pleasant work; straight salary; permanent, with advancement.

Don't let this opportunity pass by.

Buy the bond: do not try to whitewash the Huns. Buy the bond and put it up as security for the lime. It is a concrete illustration of the fact that contribution now to a complete victory which is in sight will be the security for every other good thing!

What Hope for Defective Prunes?

To the Editor: I have some prunes which got wet and are in bad shape and will not dry. Can I do anything to make them dry and will the Government accept them for any use when dried?—A. C., Ione.

We know no way to make things dry except to subject them to a blast of hot air. If the amount is not large you can treat them to a good hot fire from the kitchen stove—just as the housewife treats her washing on a wet Monday. Perhaps you will get a hot norther to help you out, unless fermentation and decay have set in already. The Government cannot do anything with defective prunes. Their conditions of long shipment and storage require that the fruit shall be perfectly cured and so far as possible indestructible. The local market may perhaps do more. If the fruit is not soured or moldy and is of good flavor, it is possible that scarcity may help people to eat prunes with their eyes shut until the next crop comes in. If, however, the prunes are off flavor, there is no hope for them except for hog feed, and they must not be too bad if used even for that.

Comparative Values of Animal Manures.

To the Editor: What is the comparative value of horse and cow manures?—W. L., Penryn.

In particular cases the value of the manure depends more upon the feeding than upon the kind of animal producing it. For particular uses the value depends more upon the nature of the manure than upon the plant food contained. For these reasons it is impossible to make direct comparisons of values. However, Dr. Van Slyke in his excellent treatise on "Fertilizers and Crops" (which every farmer should have at hand for frequent consultation), after considering all the variables involved, compiles the following table, as showing the closest approximation to relative value, viz.: Value of plant food per ton of average manure: Horse, $2.50; cow, $2.20; pig, $2; sheep, $3.20; steer, $2.20; hen, $4.40. This calculation includes the variation in the amounts of water usually contained.

Japanese Quince Wholesome.

To the Editor: One of our residents thinks he was made sick through eating preserves of the flowering quince. I have not considered this quince poisonous, but would like your opinion.—Reader, Auburn.

The fruit of the flowering quince, commonly called the Japanese quince, is edible and wholesome. It is quite largely used in making jelly, preserves, etc.

Bad Grapes Need Not Be Picked.

To the Editor: Will it harm the vines to leave unpicked grapes on them? I was unable to pick any of my Sultanas on account of the rain.—W. L., Yuba City.

Let them hang until pruning time. Don't waste sweet money on sour grapes. Wild grapes are never picked and the vines are healthy!

California Weather Record

The following rainfall and temperature record is furnished the Pacific Rural Press by the United States Department of Agriculture Weather Bureau at San Francisco for the week ending at 5 p. m., October 15, 1918:

Stations—	Rainfall Data: Past Week	Seasonal To Date	Normal To Date	Temperature Data: Max'm	Min'm
Eureka	.26	2.45	2.52	68	48
Red Bluff	.02	7.87	1.44	86	56
Sacramento	.08	3.96	.78	84	52
San Francisco	.01	2.67	.75	85	54
San Jose	.01	6.45	.74	88	50
Fresno	.00	.59	.28	82	62
San Luis Obispo	.03	1.50	.83	98	58
Los Angeles	.00	.67	.29	98	64
San Diego	.05	.59	.59	94	58

Pruning to Rejuvenate the Almond

Written for Pacific Rural Press by John J. Fox

AS THIS is the third article in succession on deciduous tree pruning, it is not necessary to go into many details relative to the building of the young tree. The vase system will be the foundation, and we will assume that the trees are 28 or 30 feet apart. In planting, the tree is headed back to 15 or 18 inches. It will be pruned back at the end of the first year to three or four leaders. The second year cut back half or more of the new growth and thin out, but leave small fruiting wood. The third year leave as many leaders as the tree can carry comfortably and cut back to half the growth again. After this the young almond should be allowed to go and not be pruned back till it comes into bearing. Down growing and crossing branches will have to be cut off and all suckers kept out of the inside of the tree. The almond is most persistent in trying to grow sucker wood, especially when it is young and vigorous. They can be ripped out any time through the summer, but must be kept cut out every year religiously, even if they are let go till the winter.

Deciduous trees should be pruned to produce good crops of good fruit with regularity, and to distribute fruit and leaves so as to insure the maximum exposure to sunlight and air. Picture above shows a carefully pruned young almond orchard in Butte county.

LITTLE PRUNING AFTER THE BEARING PERIOD.

After the almond tree comes into bearing the only pruning necessary, probably for a number of years, is a little thinning out, always cutting back to a fork if possible. The almond is such a strong grower that it is likely to become too dense if allowed to go entirely, and this results, in course of time, in a lot of small nuts and a lot of dead suffocated wood. On the other hand, if you prune too hard, a lot of sucker wood will be started and it will just keep you busy every year. Therefore, the pruning of almonds, like all other pruning, is a matter of individual judgment. And in addition to its sucker-producing proclivities the character of the different varieties have to be considered, some being upright and others drooping in nature. In any case, those "water sprouts" are no use to the tree, except where one is wanted to renew a broken or damaged limb. In thinning a mature tree it is essential that all cuts be made to a sufficiently strong fork to carry on the functions of the limb. A stub cut (which has to be made sometimes) results in a drying out of the limb to some extent, and a regular irruption of water sprouts. Also, in thinning, the tree must not be laid too open, or the younger branches will be subject to "sun scald" as in other fruit trees.

REJUVENATING AN OLD TREE.

When almonds have been allowed to go a long time without pruning, the tree gets full of long dead whips and other undesirable wood, half dead and in all stages of uselessness. Many of the end branches have been starved by this inside growth and are dead at the tips. Shothole borers finish up the work of destruction in many cases. The nuts are mostly on the outside and branches are small in size, poorly filled and often a very light setting. This is because the circulation is poor and unthrifty and the buds weak and spindling. Old trees like this can often be brought back into profitable bearing for many years by clearing out all dead and dying wood and cutting back to a strong lateral. A good sucker can be encouraged to fill out hollow places and it must be given space to grow into a limb without having to push up 10 or 15 feet without a lateral. If the sucker does this before it is given space, then cut it back on the second-year wood. We have seen old almond trees that had become wholly unprofitable, by reason of their worn-out condition, headed back to stubs and reheaded from the abundance of shoots produced. Many of these sprouts will die out from crowding. The rest will need a lot of work in thinning down the second year when the best of them will be bearing nuts again.

The orchard can be done altogether, or one-half of the trees done one year and the other half the year following. In certain sections where there are old orchards of Languedocs small seedlings or little paper-shells, the trees could be top-worked into commercial varieties if not too old. So many of the old orchards were set too close (20 feet) that unless every alternate row were taken out even this would not be profitable.

TO SUMMARIZE.

First, the trees must be "built" by proper pruning, and not headed high. Second, after the third pruning they should be allowed to come into bearing, only removing undesirable growth—undesirable from its location or the direction of its growth. Third, keep suckers out unless there is a specific purpose in keeping a few for renewal. Fourth, keep the mature tree open by thinning, and remove all weakly growth by cutting back to a strong lateral.

CARE OF LARGE CUTS.

When making large cuts and when beheading or top-working an old orchard, it is essential that those cuts be thoroughly covered to keep out the spores of fungus that produce the spongy, rotten condition of the inside wood. Paint checks; grafting wax hardens and chips off and besides it is too expensive. Use asphaltum (D grade). This is the stuff that is used to cap the highways with and it can only be put on warm. But it is well worth the trouble expended.

Tree Planting and Care of Nursery Stock

Written for Pacific Rural Press by John J. Fox

As the season for planting out young orchards approaches a few timely reminders will be in order. California nurserymen do not defoliate their young deciduous stock in order to ship early, therefore the wood is always matured before the trees are dug.

THE TREES ARE RIGIDLY INSPECTED.

After digging, the trees are carefully inspected by experts to see that they are in good condition. They are then inspected and passed (or rejected) by the County Horticultural Commissioner or one of his inspectors again before the buyer receives them. The nurseryman, for the protection of his own property, takes the greatest pains in handling and caring for the stock so that it arrives at its destination in the best possible condition. Here is its critical period. Directly after the trees have been inspected they should be heeled in—and heeled in right. It is dangerous to store them away in your cellar for very long, so the best way is to heel them in as soon as you can. Dig a good deep trench in a well-drained spot, where the soil turns up nice and friable, set them close together in an upright position and shovel the earth in so that it sifts down between the roots and firm the earth fairly well around the top so that a drying wind cannot penetrate and injure the roots. It is a mistake to run a lot of water onto them, especially on ground that is at all heavy. Also it is a mistake to stick them into a tub of water or a cold spring or stream and leave them there. It is all right to freshen them up with a dip if they need it and then heel them in, but that is all. Many trees have been injured by a sort of damping off in the trench that is apparently due to poor heeling and an unsuitable place for trenching.

> The critical period in the life of a fruit tree is when it has reached its destination after leaving the nursery. The utmost care should be taken of the stock from the moment of its delivery.

PLANTING OUT THE TREES.

Trees should never be planted out in a north wind or any other drying wind. No more should be removed from the trench than can be planted promptly. And it is always well to keep them covered with a wet sack until they are planted.

We have seen trees laid out one by one right across a large field in the wind and early March sun waiting to be planted some time later in the day. This is not giving the young trees a chance.

At planting time each young tree is carefully examined before it is planted, the large roots cut back if necessary with a pair of hand shears, always making an oblique cut instead of butting it off square, as the healing over is more rapid and complete. Also any roots that may have been badly broken should be sheared off behind the break so as to avoid any possible ground infection. It pays to dig a good big hole and the tree should not be planted any deeper than it was in the nursery. Generally speaking, the bud or graft will then be about level with the top of the ground. It is very common among men who have been vineyardists all their lives to bury the union 8 or 10 inches below the surface, "so as to have the roots down where they can get plenty of moisture." Those trees, if they live, will never make much growth. It pays a prospective orchardist to supervise the planting of every tree himself, or have men upon whom he can rely to do as they are told.

Farm Products Must Increase

If we are to win the war and win it quickly our soldiers and our allies must be well fed. We cannot expect them to do their best to win unless we do our best to back them up. How are you going to make every acre of your farm produce to its utmost? Just as our army must be well fed so your soil must be fed. You must supply it with the elements necessary to produce crops.

GOLD BEAR FERTILIZERS

are scientifically manufactured to meet California soil conditions and crop necessities. They are made from animal products that contain the necessary elements to feed your crops.

PROPER CONDITION OF SOIL NECESSARY.

The soil should be in nice friable condition when the trees are planted—neither too wet nor too dry—and the earth firmed down when they are in to prevent drying out. The earlier young trees are planted on black adobe the better the soil settles around the roots with the rains. In planting young pears or prunes on adobe it always pays to go around with the water wagon in May and give the young trees 5 or 10 gallons apiece (even where irrigation is not practised) and another dose later if they seem to need it. Indeed, we think that all young trees are benefited by this encouragement the first year. They become established more firmly by this attention. Let the belly of the tree face the northeast and the hollow towards the southwest.

The summary of the foregoing notes is "care" in the handling of valuable nursery stock from the time it is delivered.

PEACH BLIGHT AND SHOTHOLE OF APRICOT.

[Written for Pacific Rural Press.]

By the time this reminder appears it will be approaching the period when the spray outfit will have to be put in shape for work and the materials bought ready to use.

THE FIRST SPRAY.

For the first spray for these diseases is as important as the second. Spray the first time during November and not later than the second week in December with Bordeaux mixture, 5-6-50; i. e., bluestone (copper sulphate), 5 pounds; quick-lime, 6 pounds; water, 50 gallons. The beginner must be cautioned against dissolving the bluestone in a metal vessel. It must be dissolved by itself in a wooden or earthenware receiver and the lime slaked separately. The two ingredients will keep in this way, but must not be mixed till they are ready for use, and they should be well diluted before mixing. If the weather be rainy, a few pounds more bluestone can be used.

THE SECOND SPRAY.

The second spray is done in the spring with lime-sulphur solution (winter strength) just as the buds swell, of which we shall give notice when the time arrives. Should rains or the wet condition of ground delay this spraying until the buds break, then the strength of the lime-sulphur solution must be reduced or Bordeaux mixture used. The former is preferable, however, if possible, as it will also get the peach twig borer, curl leaf, the early hatches of red spider and thrips, as well as the blight, also any scale except the brown apricot and similar scales that are mature.

In peach blight the livid spots appearing on the bark and around the buds die out during the winter and much of the fruiting wood and young growth may be killed. During the rainy season a sort of jelly exudes from the dead and diseased areas. Everybody who has had shothole fungus on apricots and had their fruit spotted and buds killed from the effect knows this disease without having it described again.

SPRAY IN NOVEMBER WITH BORDEAUX.

Is anyone going to try spraying their apricots for "blackheart" this year by using the same methods as the above, where they lost twigs and small branches? Professor William T. Horne, University of California, says this is entirely distinct from the gum disease in the trunk and saw no reason, when I asked him, why this should not be tried. Frank Gordon of Gordon Valley, Napa county, says they had an outbreak of blackheart years ago in his apricot trees, but it finally disappeared.

Henry Markarian, a prominent fig grower of Fresno, found considerable land available for Calimyrna figs in Madera county last week. California is the only State in which these figs can be grown with commercial success and within the State in limited sections only. Mr. Markarian realized $75,000 for only a fourth of a crop from his 160-acre sixteen-year-old orchard this year.

The recent rains have made possible at least one extra crop of alfalfa in a large part of the State, and while some hay was spoiled in the fields the net result will be decidedly beneficial, as there will be many thousands of tons of hog and cattle feed grown because the rains came early.

LARGEST STOCK IN AMERICA
Decomposed.

Sheep-MANURES-Steer

Concentrated
In Perfect Mechanical Condition

Because of the shortage of manures in this territory it will be well to consider NOW your fertilizer requirements for the next twelve months. More carefully handled and prepared than other manures. From highest nitrogenous feed.

	Steer Analysis		Sheep Analysis
Available Nitrogen	1.58 to 1.75%	Available Nitrogen	1.75 to 2.00%
" Phosphoric Acid	.86 to 1.20%	" Phosphoric Acid	1.12 to 1.29%
" Water Soluble Potash	3.48 to 3.92%	" Water Soluble Potash	3.62 to 3.88%
" Humus	5.07 to 5.70%	" Humus	7.42 to 8.12%

"Planted Four Years Ago, and Look At Them Now"

"Hello Fred—Do you remember when we planted this orchard? Remember how I laughed when you wanted me to try dynamite and blast out the holes instead of digging them, and how you finally talked me into it? Well—I'm laughing another way now, Fred,—and you can bet your boots I thank you for telling me about

HERCULES DYNAMITE

"I never planted an orchard with less labor in my life;—I never had one that grew so fast nor where fewer trees died. And it's bearing a full year ahead of my neighbor's trees that were planted at the same time, in spade dug holes."

"My this-year's crop will pay twenty times over for the dynamite that we use, and it makes me smile to think how easy it was to plant those trees!"

"There are a good many people using dynamite in their orchards around here now. They're finding out that the easiest way is the best way when it comes to planting trees."

"They say, too, that blasting between the rows is a good way to keep your bearing orchards in good shape; it loosens the earth deep around them and gives their roots a chance to spread. I'm going to try it next spring."

"I want to thank you again, Fred, for lending me your copy of 'Progressive Cultivation'. I've got one myself now—the Hercules Powder Co. sends it to you free, if you write them for it. I wouldn't part with my copy for the world!"

A Capri Which Will Not Caprify

[Written for Pacific Rural Press.]

To the Editor: Will you please look into the question of the vitality of the pollen of the Pseudocarica Capri fig? There were comments in the Press a few years ago, favorable. I tried one thousand of them in my orchard last May and the Smyrna figs all dropped off as usual. Prof. Rixford says that there is a female of the Pseudocarica that ripens? This Pseudocarica gave off wasps for several days.—G. C. A., San Francisco.

[Answer by G. P. Rixford, United States Department of Agriculture.]

The Ficus pseudocarica is a native of northeastern Africa, in Abyssinia and the Italian colony of Eritrea. It was introduced into California from Italy by Dr. Franceschi of Santa Barbara. Five or six years ago Walter T. Swingle of the United States Department of Agriculture, called attention to the fact the mamme (over winter) crop contained stamens and that it might furnish pollen sufficiently early to caprify the first crop of Smyrna figs. This discovery attracted attention for the reason that the mamme crop of the Smyrna capri does not, except very rarely, contain stamens, and that the Smyrna profichi crop is too late for the purpose and therefore the first Smyrna crop, for lack of pollination, was always lost.

Attempts to use the mamme of F. pseudocarica have met with so many failures during the past season that the question of the viability of the pollen of the mamme of the species has been raised. Besides the failure mentioned by your correspondent, others have been called to my attention. I have not yet had an opportunity to test the vitality of that pollen, but propose to do so when the next crop becomes available.

The female of the species is now established in California and is bearing in the Maslin orchard at Loomis. It is evident that the fruits secured were pollenized by insects from the Smyrna profichi. This raises the interesting question, which is sometimes met with by plant breeders, that one species may refuse to take the pollen of another of the same genus, but that the reciprocal pollenation is sometimes successful. A striking instance of this has developed in the wonderful work Dr. Frederick V. Coville, botanist of the United States Department of Agriculture, has done in breeding blueberries until he has increased the fruit to three or four times its normal size. In his efforts to get a cross of our California Vaccinium ovatum and the eastern Vaccinium corymbosum he found that he could not secure a setting of fruit on V. corymbosum with the pollen of V. ovatum, but succeeded with the reciprocal pollinations of corymbosum pollen on ovatum.

California Walnut Growers' Association

[Written for Pacific Rural Press.]

It is expected that the walnut crop of this year will exceed the 1917 crop in tonnage. The quality of the nuts will be unusually fine, being larger and more uniform. Last year's crop averaged 42 per cent of No. 2s; this year the No. 2s will not average over 4 per cent of the crop. We published the advanced prices last week. Owing to the scarcity of burlap bags, association shipments will go forward this year about half in burlap bags and the rest in saxolin bags. Saxolin is a strong paper, open weave. It is said to be tougher than burlap, more attractive in appearance and shows the nuts through the weave, but will not withstand a heavy wetting.

The import situation is at present complicated and uncertain. The United States War Trade Board has prohibited the importation of all nuts without license, except coconuts. It is said that licenses for the importation of walnuts from China have been uniformly refused. Even if granted, the prevailing freight rates would make importation almost prohibitive. All recent shipments of the French crop of 1917 have gone to Great Britain, and it is said the old French crop is now exhausted. The French Government has prohibited entirely the exportation of walnuts in the shell, but this embargo may be lifted at any time. A normal crop of good quality is reported in the French walnut districts. It seems practically certain that the California output will have to be depended upon in the United States for the holiday trade, which is normally about 45,000,000 pounds.

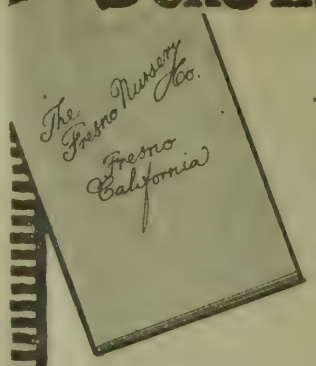
State Land Settlement at Durham

[Written for Pacific Rural Press.]

Dr. Ellwood Meade of the University of California announces that the farms of the remaining unit are open for inspection and applications for settlement from October 15 to November 15 at noon. There are 28 farms and five laborers' allotments, and anyone interested in securing one of these farms should write to the Land Settlement Board, room 101, Agricultural Hall, U. of C., Berkeley. Owing to war conditions and the consequent high prices of labor and materials, Dr. Meade suggests that prospective settlers defer building operations on the new holdings, except such as are immediately necessary.

Word just received from the U. S. Forestry Service says that in the allotment of privileges in the national forests for cutting timber and grazing stock preference will be given to buyers, in reasonable amounts, of Liberty Bonds.

Send in Your Name



Every Horticulturist in the state will want our new Fruit Tree Catalogue when published. Your name and address on a postal card sent now will assure you of a copy.

FRESNO Climatic conditions cannot be excelled for the production of well matured trees. **"FROM THE ROOTS UP"** is our motto. Commercial orchardists all over the state purchase our pedigreed trees because they give best results.

Place your orders now and have us reserve your stock. Do not forget to send your name and address and make sure of receiving an early copy of this year's catalogue and price list.

Fruit Trees That Produce

Pedigreed Prune Trees

When you plant prune trees, plant the best—trees that will grow, and produce, and pay! We make it a practice to bud our prune trees from parent stock of proven productiveness and quality. The scions are carefully selected by trained experts and the budding is done in the most skillful and scientific way.

Alfalfa Growers Fully Organized

Growers representing nearly 30,000 acres of alfalfa have signed up in the "Alfalfa Growers of California, Inc." The directors, at a meeting August 30, passed a resolution unanimously declaring that enough acreage had at that time been signed to justify permanent organization. Subscriptions have been steadily coming in since then, many of them without solicitation, according to Secretary Fred N. Bigelow, who is also secretary of the State Market Commission. Incorporation papers have been filed with the Secretary of State and the association is now fully organized as a growers' co-operative non-profit corporation, with one director appointed by the State Market Director to insure business safety. At an executive committee meeting, October 4, J. W. Thomas of Porterville was appointed general manager. Mr. Thomas has had almost nation-wide experience on the marketing end in both the West and the East. Headquarters will be in the Central Building in Los Angeles. Sales offices will also be established in San Francisco and with the "California Alfalfa Growers' Association" at Riverside. J. L. Farrar of Riverside and his helpers will continue an active campaign for new membership. Details of establishment and financing will be completed as soon as possible and the new association expects to be actually selling hay within two months. Reports of people plowing out alfalfa have been exaggerated, thinks Mr. Bigelow. The writer has personally met many farmers in various parts of the State who intended planting increased acreage this fall and next spring. Considerable alfalfa hay was spoiled by the rains, but the increase in feed due to the rains counterbalanced any effect the spoilage might have had on general prices.

Potatoes in the Weed Patch

[Written for Pacific Rural Press by R. E. Hodges.]

"I live in the Weed Patch and I'm proud of it," we can imagine George H. Peters saying; for the Weed Patch is one of the most fertile districts in the southern San Joaquin Valley, having been built up during the ages past by overflow from Caliente Creek at the foot of the Tehachapis. In the early days, it is said by persons more or less truthfully inclined, a man on horseback might easily get lost in the great weeds of this area, but he could travel as well by night as by day, for the tall weeds were mostly sunflowers. Mr. Peters is not responsible for any such wild tales and we believe that he tells nothing but the truth, which he can prove by next spring's crop, when he says that he harvested 15,000 bags of White Rose potatoes and shipped 11,000 of them to the East from 130 acres planted last spring. One 40-acre piece averaged 225 sacks per acre marketed. These reached the Middle West before their early potatoes were ready. Another crop is growing this fall from seed reserved from second sizes of the spring crop. These will be dug in mid-winter.

EXPERIENCE SHOWS BEST WAY.

Mr. Peters, according to Farm Adviser Myron A. Rice, is the pioneer and largest potato grower of the district. He recently sold his home place in the Weed Patch at 250 per acre, partly on the strength of the potato profits, and invested last fall in a new farm on the edge of the cultivated part of that district.

The field is plowed about mid-January at least eight inches deep and worked down ready to plant about February 1, depending on winter rains for initial moisture. The first irrigation comes about April 1, when the plants are three or four inches tall. The machine planter ridges dirt slightly over the seed pieces and a furrow is made between rows for the water. There is 15 feet fall in a half mile, the land being otherwise uniformly level, so there is no flooding of the plants. Flooding is to be avoided because soil would harden around the plants, where it could not be easily loosened. Irrigation and cultivation follow each other every seven to ten days even until a week before digging the spring-summer crop. Sometimes five irrigations are given. The vines should be kept a light green color. When they turn darker they need water. Mr. Peters was irrigating one end of his field last summer while digging the other. This was necessary because otherwise the vines would die down and the hot sun would injure potatoes in the ground if vine protection were thus removed. The spring-summer crop is dug with the vines entirely green, but the skins of the tubers are partially set and do not loosen badly. Two or three machine diggers are used and they have been found eminently satisfactory. One man with four horses and a machine digs about four acres per day, leaving the spuds on top of the ground uninjured. Vines were so thick on part of the place last spring that they had to be raked off ahead of the digger, which would have clogged up. Mexicans pick up the potatoes at 15 cents per sack. The cost was 10 cents last year.

POTATO GRADING PAYS.

They sack only the No. 1s, leaving the seconds and culls to be hauled to the shade and sorted later. The No. 1s go direct to the cars, which were shipped to the Middle West by the California Vegetable Union.

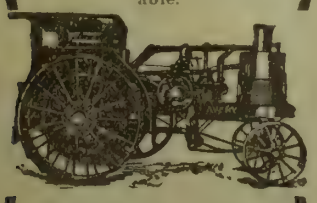
Grading is the hardest job to get done right under recent labor conditions; but Mr. Peters has always graded better than Government grades and has not lost at the market end. One man lost $400 on a car of ungraded potatoes which had to be separated from rots at the eastern end and graded there.

Land to be planted for the fall crop is furrowed as close together as convenient, irrigated so water goes down three or four feet, worked down with harrows and clod smasher. The working kills lots of weeds that sprout in the hot weather during and shortly after this irrigation. As soon as possible during the first 25 days of August the seed are planted by machines, each operated by two men with four horses. Right after planting another irrigation comes to keep the ground cool and bring the plants up. Not over three irrigations are given the fall crop, and October 15 is the final safe date.

The AVERY

Ends Farm Slavery

The Avery is the mightiest of all tractors. It costs less to buy, less to operate, and less for upkeep. It does not need an experienced engineer to run it. It is the simplest tractor built: all parts are in plain sight and get-at-able.



There is a size Avery Tractor to fit every size farm. You can buy a 5-10 H. P. Avery for $650 here. Other sizes in proportion. Write and let us tell you how you can raise bigger and better crops at a smaller cost with less work. Address Department L.

F. H. POSS CO.

[Written for Pacific Rural Press.]

Government Rule for Hay.

To the Editor: What is the Government rule for estimating weight of hay in the stack?—Subscriber, San Francisco.

[Circular 131 of the Bureau of Plant Industry, Washington, D. C., discusses this subject. A postal card will bring it to you. The cubic feet per ton will vary according to the kind of hay, its moisture content when stacked, how high the stack is, how long it has stood, how dry the atmosphere has been, etc. An average to figure from is 450 feet per ton. Alfalfa thirty days after stacking may weigh a ton per eight-foot cube. To find the cubic contents of a stack, the old Government rule is to subtract the width from the overthrow (distance over the top from the ground on one side to the ground on the other), divide by two, multiply by the width and then by the length. This is only approximate, as the cubic contents vary with the shape or relative height and width.]

Early Baart in Madera.

One hundred acres of Early Baart wheat on deep sandy loam summer fallow near Madera yielded six sacks per acre last summer for J. L. Davis. This had been plowed in winter and again in spring after rains were over and planted last fall at the rate of 75 pounds per acre under the lap of furrows from a Stockton gang plow, without any disking or other preparation. What came up early made a good crop, but much of the seed rotted in the ground from the early showers. Mr. Davis also planted 700 acres of fallow seventeen miles east of Madera in a similar way, Early Baart being used, as it is quite generally in his neighborhood; but in that community the yield was only 2½ sacks per acre this season. It was seven sacks per acre last year on a different part of the same ranch, while Sonora yielded only five. This is a light soil over hardpan.

Wheat Prices.

Argentina has a greatly enlarged wheat acreage, stimulated by the recent but unguaranteed price of $1.55 to $1.65 per bushel. The State Government of Australia has guaranteed 83 cents per bushel for wheat and the Commonwealth Government has allowed an additional 12 cents, making a total of 95 cents per bushel for their 1918-1919 harvest. The surplus from several harvests still on hand is estimated at more than 200,000,000 bushels, and the Commonwealth would like to sell at a price netting farmers $1.10 to $1.20 per bushel. Uncle Sam is guaranteeing $2.20 per bushel at terminals for No. 1 hard white wheat of the 1919 American crop, and there is a movement on to induce him to make it $2.50. Australia has probably sent a larger proportion of her men to war than we have. Let's plant some more!

Inoculated Vetch with Barley.

Two hundred sacks of barley were threshed from seven acres by S. W. Turner of Manteca last summer. He had broadcasted 216 pounds of barley on the piece right after the first rains, which soaked about six inches deep. He inoculated 300 pounds of vetch seed and broadcasted on top of the barley before harrowing it in. There was a good stand of both, but the barley stooled so freely (as many as 29 stalks on one root) and grew so high (about four feet) that the vetch was finally smothered out. In one place where barley seemed thinner both it and the vetch grew three to three and a half feet tall and was cut for hay. About one-third of the seven acres threshed had lodged on account of wind and only two-thirds of the grain on that part could be harvested. Mr. Turner is an enthusiast on inoculation of vetch and mixing it with grain for greater growth of both.

Delta Onion Acreage.

Stockton is the largest shipping point for onions (except the Bermuda varieties) of any place in the United States, according to the U. S. Bureau of Markets. Acreage in the Delta for 1917 was estimated as 5935 in San Joaquin county and 2133 in Contra Costa county, while the 1918 acreage, according to R. G. Risser of the Bureau of Crop Estimates is 7765 in San Joaquin county and 2133 in Contra Costa.

No Beets in Bermuda Grass.

It is out of the question to plant sugar beets where Johnson grass or Bermuda has a stand, according to J. C. Wood, a beet grower of wide experience in Tulare county. They would have to be hoed all the time, and enough labor is not to be obtained. Digging beets out of Bermuda is like digging them out of prairie sod.

All-Year-'Round Drying Plant.

After being closed for several weeks to make improvements, the drying plant of the E. Clemens Horst Co. at Wheatland reopened on the 7th to resume operations on potatoes. Two hundred people will be employed during the winter on drying vegetables, most of which will be taken by the Government.

Against Dry Seeding of Grain.

"We can't sow grain before the rains in most of Salinas Valley," said a grain grower recently. "Tocolote would be it, and anyhow, if weather turns bright after the first rain, a surface crust bakes so hard that the seedlings can't come through enough to make a stand."

Rye Cover-Crop for Potatoes.

Rye is being planted on sandy sediment soil as a cover-crop to be plowed under before planting spring potatoes, by George H. Peters of Kern county. He irrigated thoroughly through furrows. Leveling them down was all the cultivation needed before planting.

Names of Fertilizer Dealers.

"Commercial Fertilizer," by P. L. Hibbard, gives the list of fertilizer dealers of California, together with an analysis of various brands. Send to the University of California for Bulletin No. 286.

Guarantees for the 1919 Wheat Crop

To the Editor: Does the Government guarantee to buy what wheat we raise in 1918-19? What is the guaranteed price f. o. b. Turlock? What variety would you plant?—A. G. C., Turlock.

[The Government guarantees to buy your 1919 wheat crop if you do not sell it to a grain buyer or a miller and if you will ship it to a warehouse located on San Francisco Bay. It cannot be sold to the Government f. o. b. Turlock. If your wheat grades No. 1 hard white, the U. S. Food Administration Grain Corporation will pay $3.66½ per cwt., less 1 per cent administration fee. They will allow 15 cents per cwt. additional for the sacks if used only this time, but will deduct ¾ pound from the total weight to cover weight of sack. You must pay the freight from Turlock to the terminal warehouse, to be designated by the Grain Corporation. The wheat will be sampled and graded by a Federal grain inspector and payment made as soon as possible. Your wheat may belong to one of nine grades or it may be so smutty or mixed that it falls below any of them and will be valued according to sample. Club and Sonora bring lower prices than soft white grades. Hard white grades are highest priced. Variations are between $3.48 1-3 and $3.66 2-3 per cwt. Try Early Baart or Bluestem in your district unless it is too dry for anything but Sonora or Club.]

Increase Your Alfalfa Tonnage—Plant Germain's Hairy Peruvian Alfalfa Seed.

Germain's HAIRY PERUVIAN

Why not plant the kind of alfalfa that will give you the maximum yield? It is the patriotic duty of every farmer during these critical times to make each acre produce to the extreme limit. Hay prices are destined to soar sky high, according to the best authorities.

Germain's Hairy Peruvian is the *heaviest producer* known. It grows vigorously in all climates—does well at 5000 feet or at sea level.

Our limited supply is rapidly being sold out. Your order should be placed at once.

Edward Richmond of Wilmington, Cal., says: "I cut Hairy Peruvian alfalfa five times in six months from planting. Reserve 200 pounds more for me."

To be on the safe side order only Germain's Hairy Peruvian—sold only in sealed and stenciled sacks.

Before planting, inoculate seed with FARMOGERM and get larger and better crops, which mature earlier than crops from untreated seeds.

When you write please mention this magazine.

Save money and harness for war

Leather is scarce and harness expensive because of the war. Make your harness last longer with Eureka Harness Oil. Gives new life to leather. Replaces natural oils dried out and protects leather fiber from dust, sweat and moisture, which cause rot. Keeps harness strong, flexible and jet black. No animal oils in "Eureka"; rodents dislike it and won't gnaw harness dressed with

EUREKA HARNESS OIL

MADE BY STANDARD OIL COMPANY (CALIFORNIA)

THE 1919 WHEAT CROP WILL BE INCREASED.

(Continued from first page.)

NEW VARIETIES.

It was expected that the Sperry field experiments with Australian and other wheats near Farmington might prove certain new varieties superior to our common sorts. It proved many of the varieties inferior, but at least two showed notable superiority in the tests there. Seed of these are not available for general distribution, but a few remarks will be interesting. The Sperry No. 1 or Bunyip variety yields as heavy as Early Baart, and has slightly better milling quality. It is as early, but is smooth headed. The grain weighed 64 pounds per bushel as against 63½ for locally grown Early Baart. The kernels are shorter, plumper, equally uniform in all qualities. This is the result of several hybrids made by the Australian plant breeder, Farrer, and fixed in type by selection several generations before being put on the market. Dart's Imperial is another smooth-headed variety yielding heavier than the two others mentioned, but it matures eight or ten days later, and flour from it makes a slight yellowish tinge in the bread, and the loaf is not quite so large due to the quality of its gluten.

EARLY SEEDING.

Whether the yield of wheat will be best from early or later seeding depends on the soil, other things being equal. The object of early seeding is to get winter growth of roots to be ready for vigorous spring growth of the tops. But too rank a growth of straw yields less than a moderate amount, and is liable to lodge, especially if spring winds or rains are heavy. The lodging and the rank leafy growth are more favorable to rust. Early planting on good strong land is likely to give too much leafage and straw, but on most grain land with a tolerable season wheat may well be sown as early as possible. Let us go ahead expecting enough rain at the right times.

HOW 1919 CROP WILL INCREASE.

We give below the seven ways in which the 1919 wheat crop may be increased as outlined by the Farm Bureaus: (1) One-tenth of the barley land if planted to wheat would alone make the needed increase; (2) new land formerly idle or used for pasture will be planted; (3) some land formerly dry farmed to wheat may be irrigated; (4) some fields could be fertilized; (5) smut can and certainly should be largely prevented; (6) early thorough seedbed preparation is needed; (7) best seed of varieties adapted to each locality will add to the average acre-yield. Shoot the wheat to the Boys Over There!

A LARGE UNDERTAKING.

G. A. Nehrhood of Paso Robles asks: "Should war conditions prevent the planting of fruit trees?" We confidently answer: "No." The chief industry of California next to livestock is horticulture. Our fruits and nuts go to every corner of the world. We must not stop the wheels of productive industry. In young orchards, on good ground, intercropping is practiced anyway. Mr. Nehrhood has bought 46,500 fruit trees, 80 per cent of which are almonds and 20 per cent French prunes, which he will plant out on the El Pomar Ranch, northeast of Atascadero. He has 2100 acres already bearing or coming in. Two-thirds of his almonds are Nonpareils, the rest are Drakes Seedlings and Texas Prolific. He claims to be raising more food (beans) per acre among the young trees, without irrigation, than the average grain grower produces in the open. And the trees are growing well.

Specialists in bee disease will be interested in Bulletin 671, "The Diagnosis of Bee Diseases by Laboratory Methods," just issued by the United States Department of Agriculture.

Get These Tractor Plow Advantages

in the

JOHN DEERE TRACTOR PLOW

Specially Adapted for Plowing in California

There is special satisfaction for you in using the John Deere No. 5 or No. 6 Tractor Plow because these plows are built to meet the particular plowing requirements of California.

They are unusually steady running. Controlled by the wheels at all times because the axles are rigidly fastened to the beams. Land wheel is set back, balancing the weight of the plow over all of the wheels and insuring even depth of plowing in uneven ground. The plows get down to position quickly and stay in the ground while plowing.

Exceptionally strong in every part. Beams warranted not to bend or break. Beam braces have extra long lap. Large bolts and lock washers hold all parts rigidly to place.

Simplest and most dependable power lift ever designed. No chains or sprockets. Powerful clutch engages positively, raising bottoms high and level.

Location of land wheel and front furrow wheel permits plowing close to trees or vines in throwing either to or from the row. Both levers out of the way of limbs while plow is at work.

Unusual clearance for unhindered work in trashy land or in deep plowing.

Quick Detachable Shares save time and labor without sacrificing strength or close fit. Loosen one nut to take a share off. Tighten the same nut and share is on tight.

Genuine John Deere bottoms wear, scour and pulverize to best advantage.

Hitch adjustable for any standard tractor. Two, three and four-bottoms sizes, 10, 12 or 14 inch cut per bottom.

You will find these plows especially dependable for better and longer service. Investigate them at your first opportunity. Your John Deere dealer will show them to you.

Send for Free Books Write today for our free booklet describing fully the John Deere Light Tractor Plows. It has a message on tractor plow value that you will find profitable to you. Ask also for our big free book *"Better Farm Implements and How to Use Them."* Its 156 pages describe a full line of labor saving implements—(tells how to adjust and operate many of them). It is full of practical information that will help you. Put it in your library. Use it as a reference book. It will be worth dollars to you.

To get these books, mention the implements in which you are interested and ask for package Pt. 22

ZEROLENE
The Standard Oil for Motor Cars

The Popular Motor Oil

More ZEROLENE is used for automobiles on the Pacific Coast than all other oils combined.

Leading motor car distributors praise ZEROLENE, correctly refined from selected California asphalt-base crude, because it maintains its lubricating body at cylinder heat and gives perfect lubrication with less wear and less carbon deposit. Get our lubrication chart showing the correct consistency for your car.

At dealers everywhere and Standard Oil Service Stations

STANDARD OIL COMPANY
(California)

Engines are either water-cooled or air-cooled. This, the air-cooled type, like all *internal combustion engines*, requires an oil that holds its full lubricating qualities at cylinder heat, burns clean in the combustion chambers and goes out with exhaust. ZEROLENE fills these requirements perfectly, *because it is correctly refined from selected California asphalt-base crude.*

The production of honey in California this year will approximate 12,000,000 pounds, it is estimated. On an average season price of 20c a pound, this would bring the apiarists of California about $2,400,000.

The California Tomato Growers' Association is taking action to compel members to fulfill their contracts in the face of a rising market.

General Agricultural Review

Field Crops.

The forecast for corn in California this year indicates a production of 2,644,000 bushels.

Stanislaus county has 32,513 acres of wheat this year as compared with 5043 acres last year.

Pumpkins, squash, persimmons and other "winter" stuff are beginning to arrive on the San Francisco market.

The California rice crop is an exceptionally good one this season, notwithstanding the damage done by wild ducks.

Fall sown potatoes in California have made excellent growth. The condition is 2 per cent better than a month ago.

On account of the long drouth in California this year, the oats yield suffered slightly in both quality and quantity.

The San Joaquin Valley Sugar Company is considering the expediency of moving its Visalia sugar factory to Corcoran.

Owing to the high price of beans this year, many of the threshed-over fields are being gleaned by women and children at a good profit.

Barley suffered severely from the late heavy rains. The yield this year is three bushels below 1917 and the quality 7 per cent lower.

The Clemens Horst drying plant at Wheatland has resumed operations on the desiccation of potatoes after being closed for some weeks to permit of improvements. It is thought the plant will be running all winter.

The cotton crop of California and Arizona, with its by-products, this season will reach a total valuation of more than $16,000,000, according to Food Administration officials who recently held a conference on the subject in Los Angeles.

Farmers in the Natomas district report that the prospect for a bean crop surpasses all estimates made some three weeks ago when damp weather threatened to cut the yield heavily. Harvesting there is now under way and yields are running around 80 per cent of the 1917 yield.

A Rural Press subscriber who visited the office this week showed the editor some very fine specimens of long staple Egyptian cotton grown this season on land near Wasco, Kern county, by Goertz & Unrah. It was planted May 10 and picking is expected to begin the latter part of this month. At this writing the stand looks good for a bale or more to the acre. It will be ginned at Bakersfield. The subscriber intends to increase his planting fifteen-fold next year.

Deciduous Fruits and Nuts.

The Newcastle Fruit Exchange is building a new structure for its shipping accommodations.

Greece expects to have a dried currant crop of 180,000 tons available for foreign export this year.

At the Goleta walnut house this year 70 girls are employed in separating the meats of the nuts. The quality of the nuts in that district is good.

Apple growers of Tuolumne and other mountainous sections of the State are urged by State Commissioner G. H. Hecke to organize and concentrate on standard varieties only.

County Horticultural Commissioner D. F. Norton of Nevada county says that 57,341 boxes of pears were shipped from that county during the season now closing up to October 1. The variety was mostly Bartletts.

The Sebastopol section in Sonoma county is said to be the most highly specialized of any early-apple district, although limited in extent. Gravensteins comprise 50 per cent of all apples grown in that section.

An emergency freight rate of $1.10 on this season's crop of apples from points of origin in Washington, Oregon and Idaho to the East has been agreed upon by representatives of the Railway Commissions of the three States, shippers and the Railroad Administration before the Interstate Commerce Commission. It is agreed that proposed 25 per cent increases be established on all other fruit, and same increase apply to apples where it would not put the rate above $1.10.

Grapes.

Shipments of grapes from California for 1918 to date almost double the amount shipped for the corresponding period in 1917.

The War Industries Board has been appealed to to allow the wineries to be opened to make some commercial product of the sugar and alcohol of damaged fruit, to save growers from heavy losses.

Citrus and Semi-Tropical.

Some Woodlake (Tulare county) lemons recently shipped brought $7 a box on the Philadelphia market, it is reported.

A 15-acre grove near Riverside will supply this year a large part of the citrons used in America in the celebration of the Jewish Feast of the Tabernacles. The citron is a close relative to the lemon.

Valencia shipments this season from Redlands have totaled less than 20 per cent of a normal crop. High prices, however, have materially consoled the growers for the small yield.

The Valencia orange season in Spain was the most disastrous in its history. The shipments were 660,788 cases, as compared with 5,000,-

Fertilize Fertilize Fertilize

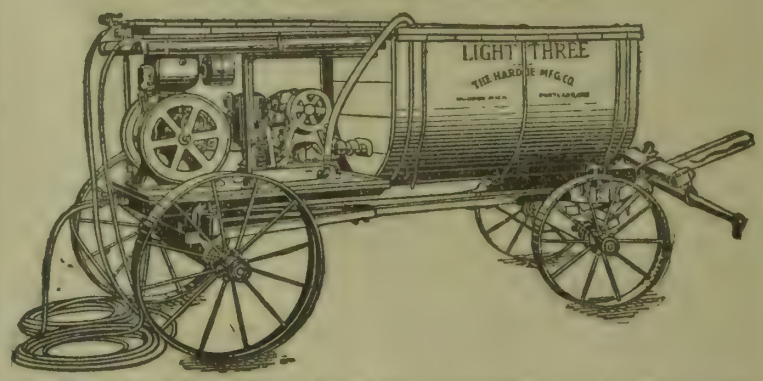
The Hardie Triplex Power Sprayer
Is a Safe Investment



You don't buy a sprayer simply for the sake of owning it. It is not the possession that appeals to you. It is the service the sprayer gives you. We could do things at less cost, but what would we have gained? A cheap sprayer never satisfies. It gives trouble, requires repairs, fails when you need it most, and wears out quickly

The Hardie Quality Is Like Paying Less

Saving money is the same as making money, therefore every HARDIE SPRAYER pays dividends to you through its low upkeep cost and its greater durability. High pressure, light weight, large capacity, powerful engine, perfect agitation, simple construction, and the tank rebuilder. The HARDIE SPRAYERS have features that are valuable in correct spraying, and not found in others. Send for the spray catalog, it is worth your time; the truth is there, backed by the largest exclusive spray pump manufacturer. Place your confidence in a Hardie and your spraying will be a success.

THE HARDIE ORCHARD GUN GUARANTEED OR YOUR MONEY REFUNDED.

HARDIE MANUFACTURING CO. - Los Angeles, Cal.

Money In Stump Land

UNCLE SAM says the "K" Hand Power Stump Puller is O. K. Uncle Sam also says turn your stump land into valuable land and produce more. Stump land can be turned into profitable land at a small expense which means more money to you. You are paying taxes on stump land. WHY?

Now is your opportunity

One man or woman singled handed with a "K" Stump Puller can pull from 50 to 150 stumps per day at a cost less than ½ the cost of a horse power machine and about ¼ the cost of dynamite.

NO STUMP TOO BIG FOR THE

HAND POWER K Stump Puller

Simple as rowing a boat. No up-keep. Works on hillsides or marshes where horses cannot work. Weighs 171 pounds—easily moved from place to place. Absolutely guaranteed against breakage. Endorsed by the United States Government.

IMPORTANT—To one man in each locality I will make a special money saving offer. Write for it today.

FREE BOOKLET—Simply send your name and address for my free booklet on Land Clearing. It tells many things you should know.

Walter J. Fitzpatrick Box 12, 182 Fifth St. San Francisco, Cal.

000 cases before the war. England and Norway were the only accessible markets.

Lemon picking is now in active progress in the Porterville district. Shipments from this section promise to fully double those of last year. The fruit is of a high quality and price conditions in the Eastern markets are improving rapidly.

ANNUAL MEETING CONTRA COSTA CO. FARM BUREAU.

The first annual meeting of the Contra Costa County Farm Bureau was held at Martinez, Saturday, October 12, which brought out an attendance of about 700 farmers. Frank T. Swett, the president, reviewed the work of the bureau and its adviser, Carl Nichols, telling of the successful fire-fighting apparatus installed seed wheat introduced, new silos built, and other work started. Other speakers were Col. John P. Irish, on the Liberty Loan, Food Commissioner Miller of Fresno, and C. G. Johnson, State Sealer of Weights and Measures.

In connection with the meeting an exhibit of products grown in the county was made and eight tractors gave demonstrations in field work.

THE SPIRIT WHICH WILL WIN THE WAR.

To the Editor: I have received your letter in relation to farmers buying Liberty Bonds and would say I cannot buy any more now until the first of next month. I have three sons in the army and you can depend on me to do all I can for the boys. And with the help of God we shall win this war.—T. R. Harper, Sr., Fallon, Nevada.

DEATH OF E. WIGHTMAN.

E. Wightman of the Chico Nurseries died last Thursday, October 10. T. E. Harlan, his partner, is reported to be a very sick man. F. X. Bouillard, president of the company, is running its affairs for the present.

American Bean Crops

[Written for Pacific Rural Press.]

Eastern bean crops occupied much less acreage this year than last, and damage to the growing fields has been severe. Rain, frost, and disease last year reduced this season's acreage in Michigan and New York, which are the chief producing States in the East. Drouth cut this year's Michigan crop so their total will be under 3,000,000 bushels. The New York acreage was reduced about 25 per cent and that will yield only about 50 per cent of a good crop. The Colorado acreage was increased, but the total crop is estimated at about 90 per cent of last year. This reduction is largely due to 30 to 40 per cent damage in Weld county, which produced half of Colorado's crop last year. California, which in 1917 produced more than twice as many beans as any other State, has a greater acreage this year, but drouth and red spider reduced the prospects for a total crop to about 90 per cent of last year, and the recent rains have reduced the estimate to about 60 per cent of last year. Loss has been more from shelling out from the pods onto the ground than in reduced quality of those remaining to be threshed. Large quantities of beans exposed to the weather have sprouted and are no good for anything.

MARKETS.

Some foreign beans are held on the Eastern seaboard this fall, and pressure for the marketing of poor quality left-over stuff of last year's Michigan and New York crops combined to depress prices temporarily. But there is every reason to expect the market to strengthen. While bean prices for Government requirements have not been set, Lompoc dealers sold some small whites at 10½ cents before the rains. The high price here last year was $12.75 per cwt., but the Government price was $11.50. The California Bean Growers' Association figures that the cost of producing this year's crop has been 20 per cent greater than last. This is expected to influence the Government price for 1918 beans, along with the scarcity due to short Eastern crops and rain damage in the West, so prices ought to be higher.

—THE—
WONDER PUMP

Guaranteed 5 Years

The Wonder Pump Is a Wonder Because

1 It requires less power than other pumps
2 Has only 5 working parts and is simple to operate
3 It will outlast several centrifugal pumps
4 It saves its price in power consumed
5 It will pump air and water at the same time
6 It needs no priming
7 Takes up little space and is very compact

Why use a centrifugal pump when you can purchase a Wonder pump at the same price

IMMEDIATE DELIVERY GUARANTEED

Valley Seed Company

Sacramento, California
(THE FIELD SEED HOUSE)

COVER CROP SEED

If you're planning to put in a cover-crop, we have the following varieties of seed that should interest you:

Melilotus Indica	$ 9.00 per 100 lbs.
Melilotus Alba	32.50 per 100 lbs.
Canadian Peas	10.00 per 100 lbs.
Vetch	11.00 per 100 lbs.
Rye, "Rosen" Type	6.00 per 100 lbs.

With orders for Vetch and Canadian Peas we offer **without extra charge** bacteria sufficient for inoculating whatever quantity of seed that is required.

Our "ROSEN" type of Seed Rye is an improved strain, grown in Minnesota, and very much superior to the Rye that is generally offered. Get a sample of this and compare it with common Rye.

ALFALFA

Don't buy any until you get our samples and prices. No one can clean seed as we do; our separating machinery is positively the most modern, and if you will order our CALIFLORA Brand you will receive stock that is as free from impurities as it is possible to get seed.

CALIFLORA Brand ALFALFA
$22.00 per 100 Lbs.

We have grades like others offer for less money than you pay elsewhere.

WE PAY THE FREIGHT
To your Railroad Station
at Prices above Quoted

Mechanical Power on the Farm

Users of tractors, engines, pumping plants, motor trucks, automobiles, electric motors, and other mechanical farm power are invited to make this department an exchange of their experiences and troubles.

OPPORTUNITIES FOR POWER INSTRUCTION.

[Written for Pacific Rural Press.]

When so many people are buying motor trucks, automobiles, and tractors, and when so many of our mechanics have gone to war industries, woe betide the operator who gets into trouble. Repairs are likely to be made by someone who knows little about the machine but is an expert at charging prices. A man may learn well by experience how to keep his machine going, but it will be stopped a lot while he is learning, and the time lost is worth far more than repairs cost. Now, when steel for all kinds of tractors, trucks, automobiles, and farm machinery is being reduced, it all the more behooves every operator to give his machines the longest life possible. He cannot do this unless he knows how. To know how is more or less expensive—but we believe it is less expensive if learned at one of the many tractor schools and short courses now available. The University Farm Agricultural Engineering Department has been holding such short courses and will continue to do so. Several of the tractor companies have staged local short courses of great value. Several regular commercial schools are making a business of training men and women for the most intelligent and therefore profitable use of machines. We were recently privileged to inspect the National Automotive School at Los Angeles. This includes a large two-story building for shops, lecture rooms, and practice work. It also includes a ten-acre farm on which several tractors of both wheel and track types are operated, disassembled, and repaired by students. In the school building the garage part is always well filled with automobiles, trucks, and other machines of every make that has troubles, brought here by the public for students to work on at a much lower price per hour than is charged in commercial garages. Their work is done well, however, for it is under the close personal supervision of experts who act as instructors. The students on graduation are fitted for commercial garage work of a better nature than is commonly available now, but there are not enough of them. About 100 students were at work when we looked over the school. They were so distributed that none were in others' way. Some were hearing a lecture on carburation. Others were remodeling, rebuilding, and recharging batteries of various makes that had been sent in for repairs. One room has magnetos of all makes, more or less disassembled, to be rebuilt by students, placed on engines and operated right there. Carbureter adjustment is also learned by use of all the carbureters made. Wiring and timing and all other operations are learned in the class rooms with real machines before students are put onto commercial work. Pouring babbit, fitting bearings, grinding valves, tightening connecting rods, winding armatures, oxyacetylene welding, vulcanizing, lathe work, drilling, cylinder boring, practice and study of every make of self-starters, study of lubricating systems, gear shift systems, air and water cooling—these are a few of the complete list of studies combined with actual work that the students get in the various courses. Just now the school keeps a list of people about town who will furnish board and room for help at house work or odd chores.

With other schools of a similar nature, with all the short courses and opportunities to learn, a farm boy, old or young, who does not learn the operation of power machinery where he can get the learning in condensed form with least expense and least loss of time—such a one is not on the road to the front.

CLASS LEARNING TO OPERATE A TRACTOR.
The cheapest way to learn to drive tractors, trucks, automobiles, and engines is to take instruction in condensed form from those who know.

CHARGE FOR TRACTOR WORK.

To the Editor: I have an S.25 tractor and on account of labor shortage some neighbors want to exchange team work for tractor work, they to furnish engineer, oil, and distillate. On what basis per eight-hour day could this be done?—Subscriber.

[Your tractor is guaranteed to do the work of eight horses. Therefore it is worth to your neighbors as much as the use of eight horses would cost them in your locality, plus the difference in wages of several horse drivers and one engineer, plus the amount they save by buying oil instead of horse feed, and plus the advantage of getting their work done properly and timely. See our issue of September 28.]

RAIN AUGMENTS ELECTRICAL POWER.

Recent rains have added so much water for power and irrigation from mountain reservoirs, and the demand for electric power for irrigation has let up so much, that on September 30 State Power Administrator H. G. Butler removed restrictions which were imposed the middle of July on use of electricity by gold dredgers, cement plants, and sand, gravel, and crushed rock plants. The restrictions may be reimposed if no additional rains come in October. Gold dredgers are pronounced essential industries, and the other plants named have been reduced to a minimum by Government restrictions on building.

ALLIES IN THE FIGHT

Model S-25

Samson

GMC TRACTORS SIEVE-GRIP GMC TRACTORS

Tractor

The "Sammies" at the front and the "Samsons" on the farm have proven their effectiveness. Both have been tried and found not wanting. Both are doing their parts successfully in their respective fields of effort, the result of careful selection approved by rigid tests.

In the "Sammie" is crystallized all the dominant features of the ideal soldier. In like measure, we have embodied in the **GMC SAMSON SIEVE-GRIP TRACTOR** all the features of the ideal tractor,—simplicity, strength and endurance, coupled with economy in operation and ability to meet the most exacting demands day after day, fair weather or foul.

The **GMC SAMSON SIEVE-GRIP TRACTOR** stands on a sure foundation,—a record of nearly two decades of service.

The **GMC SAMSON SIEVE-GRIP TRACTOR** displaces ten horses on the farm and is adapted for countless uses, stationary and otherwise, for many of which horses are not suitable. These labors it performs quicker, cheaper and better than any other power.

The strength of its working parts and its dust-proof motor assure long life and low-up-keep cost. By reason of its simplicity, a skilled mechanic is not required for its successful operation. Its steering device makes operation easy for the driver, without strain on operator or machine. Its lubricated roller pinions deliver maximum power to the drawbar with least friction loss.

Let us send you our latest booklet, Better Farming.

STANDARD OIL COMPANY (California)

CARBON UNDER TOP PISTON RING.

[Written for Pacific Rural Press.]

The principal complaints from tractor users that E .S. Herman, engineer on the road for the Standard Oil Co., encounters are overheating and carbonizing. Mr. Herman's business is to see that troubles do not arise from use of Standard Oils. But in carbonizing, especially, the oil is often incorrectly blamed. The commonest carbon trouble, except on spark plugs, is found under the top piston rings. Mr. Herman has found complaints from this cause more numerous in winter than in summer.

To understand the reason for the trouble, it is well to remember that the piston rings are designed to have about three times as much clearance at the top as on the skirt. In a 7½-inch piston the clearance of the top ring is intended to be about .02 of an inch when cold, while the third ring down has only .0075 clearance. The reason for this is the greater heat experienced by the upper part of the piston and its consequently greater expansion. Due to the 2700 to 3000 degree of heat and to the top ring getting the first full force of the explosion and transmitting the force to the piston via its groove, the groove tends to become worn. This wearing adds to the extra space around the ring. Now when the engine is primed with liquid gasoline, these spaces make an ideal trap for the excess. And it is often some excess, too! Some tractor drivers think that if a little is good more is better and they give each cylinder a good dose. There cannot be enough air in the explosion chamber to vaporize such a charge in the right proportion for complete combustion. Occasionally also the engine is primed as many as five or six times. The unburned or partially burned gasoline which has been trapped around the first piston ring bakes and accumulates, tending to stick the engine. More priming is generally used in winter than in summer.

A tractor driver, hearing Mr. Herman tell of this trouble, volunteered the suggestion that part of the carbon under the upper ring is due to lubricating oil pushed up by the tighter rings below and then burned due to the high heat, leaving carbon deposit.

Mr. Herman stated, however, that only four or five per cent of the carbon under the upper ring comes from lubricating oil, while the rest is fuel carbon and dust. P. R. Melchert, also of the Standard Oil Co., mentions engines in which the priming cocks are on one side. The heaviest carbon is found in an arc of about 40 degrees on that side. The way to avoid most of this trouble is to prime judiciously or use another means of warming up the engine. With zero weather in Nevada a few years ago Mr. Herman found the best way was to heat the manifold with a gas torch.

SCALE IN WATERJACKETS.

Steam-engine men must keep scale out of their boilers. They use a compound. Tractor drivers must keep scale out of the waterjackets and radiators. Dissolve seven or eight pounds of sal soda in hot water and fill the radiator. Operate all day and flush out at night. It takes the scales, but if they are bad the operation may have to be repeated. This will not hurt hose or canvas.

POWER NOTES.

A public utility must deal courteously with consumers and avoid arbitrary practices, as ordered in a recent decision of the State Railroad Commission in a water service case.

A steam tractor cable outfit is used for digging sugar beets at King City, Monterey county. A big tractor at each end of long rows winds on a drum the cable which pulls the digger across and back as the engines move ahead for each pull.

Full Power From Every Drop of Kerosene—No Waste

WATERLOO BOY

Original Kerosene Tractor

Waterloo Boy tractors are unfailingly successful in operating on inexpensive kerosene. The short superheated Waterloo Boy manifold distills kerosene into fuel of great volatile force—carries every particle of gas in the cylinders without loss of explosive power through condensation.

That's why the ***Waterloo Boy*** three-plow, one-man tractor plows 8 to 12 acres per day on less than 2 gallons fuel per acre. Every drop of fuel is turned into practical, tangible power for use in field work or on belt jobs.

Mechanical Excellence Backs Up Power Ability

We purposely built this tractor strong for the strain you are likely to put upon it, and stand behind it with a positive quality guarantee.

Dust proof gear construction, perfect automatic lubrication, complete and easy accessibility of gears and bearings, easy control, make it trouble proof in inexperienced hands.

There are other reasons why thousands of farmers are satisfied with their ***Waterloo Boys.*** Many of these users' testimony is presented in our catalog—accompanied by actual photographs of the ***Waterloo Boy*** in action. Write for it.

Shall We Put in Milking Machines?

Written for Pacific Rural Press by R. H. Whitten

One day a woman called on her physician and told him that she felt wretched. "Let me see," reflectively remarked the doctor after his usual preliminary examination, "have you been eating anything before going to bed?"

"No, doctor," responded the patient, "not a thing."

"That's the trouble," returned the physician. "Just keep a glass of milk and some crackers in your room and every night eat a light meal before retiring."

"Why, doctor," exclaimed the patient in a surprised voice, "you told me never under any circumstances to eat anything just before retiring."

"Quite true," rejoined the physician, "but that was several weeks ago. Medical science has made enormous strides since then."

Enormous strides have been made along other lines, too, and perhaps in no other field has there been greater progress than in the making of milking machines. Not many years ago these machines were thrown out about as fast as they were installed, and generally for good reasons. In fact, I know of one case where a dairyman sued the manufacturers of the machine he had been using, claiming that it had ruined his cows, and he won his case.

But it was no more than natural that when these machines were first put on the market they should have a number of serious imperfections. However, through the aggressiveness of the dairymen who have taken up the mechanical milker, criticised its performance and suggested improvements, it has rapidly approached perfection and may now be considered not only a machine that will give satisfactory results, but also an essential part of the equipment of almost every progressive dairyman.

Progress! Efficiency! These are the watchwords of successful farmers nowadays. There is not a farmer who would think of cutting his wheat with a cradle, threshing it with a flail and grinding it between stone burrs. These methods were once very satisfactory, but they are out of date now. They had to give way to the modern binder, thresher and flour mill. Everywhere machinery is taking the place of hand labor and is doing the work more uniformly, rapidly and economically—in short, more efficiently.

But there is one branch of farming that until recently has been inefficient, and that branch is dairying. For centuries farmers had "harvested" milk by hand, but the clinging to this old method has brought many trials and has involved many labor difficulties. The demand for dairy products has increased constantly, yet each year has brought more serious discouragements in the way of high-priced help; in fact, in many cases it has been impossible to secure steady, dependable hand milkers at any price on account of the drudgery of the work.

So, many dairymen have been forced to turn to milking machines by adversity and absolute necessity, and not only have had their labor problems solved, but have been convinced that for real efficiency and general satisfactory results machine milking is as far ahead of hand milking as the modern binder and thresher are ahead of the cradle and flail.

It is true that even now we have some cases of apparent failure of the milking machine to do satisfactory work, and dairymen give them up in disgust, but when they are traced down to the bare facts it is usually found that the machine has fallen into the hands of an inefficient operator.

MAN THE DETERMINING FACTOR.

Any of the standard makes of milking machines now on the market will prove satisfactory in the hands of a competent operator, but it will not give satisfactory results if not intelligently operated. In other words, the results will depend more upon the operator than upon the machine used. No matter how efficient the latter may be, it is only a machine, and the human factor is important, not only in operating it but also in taking care of it.

This article is not written to help dealers make sales. Instead, we have the interests of our subscribers at heart first, last and always. Consequently we feel that we should criticise the claims made by some manufacturers that their machines can be successfully operated by a ten-year-old boy or girl—that such a child can take the place of two hand milkers.

Prof. Larsen of South Dakota sums up this matter well in his explanation of why the milking machine is successful with one man, and yet his neighbor, with the same kind of a machine, does not secure similar results. He says: "The man, the cow, and the machine—all three factors must work harmoniously and understandingly together, otherwise the milking machine is not going to be a success. If anybody thinks that he can buy a machine and just hitch it onto his cow and start his machine as though he were tapping a barrel, he is mistaken. He must remember that the cow is a living individual; that the person operating the machine must not only understand the machine but also the cow. If a man has a sympathetic understanding of a cow and a good understanding of the machine, and is able to work these three things together, the milking machine cannot help but be a success."

"Them's our sentiments," and instead of making you believe that an infant in its swaddling clothes can run a milking machine we want to impress upon you that it will require more intelligence and judgment to operate and care for it properly than is displayed by the average hand milker. So don't put in a machine until you have, or can get, the right kind of a man to operate it.

GREATEST SAVING IN LARGE HERDS.

Also, we differ from manufacturers in their statements that milking machines will pay on all farms where there are six or more cows. Considering the cost of installing an outfit, the upkeep and depreciation, and the way labor is generally used on farms having such small herds, we doubt if mechanical milkers would be practicable. We would not advise them for herds of less than fifteen or twenty cows.

In herds of fifteen or more cows they will reduce the labor cost considerably—the larger the herd the more the saving. The Department of Agriculture made investigations in dairies of different sizes, with the following results, the first column of yearly cost figures being for machine milking and the second for hand milking.

15 cows or less	$7.39	$10.91
16 to 30 cows	7.31	10.26
31 to 50 cows	6.03	10.11
51 cows or more	4.47	10.45

These figures were compiled in 1916 and the differences would be far greater now, so there is no question about the saving in labor by the use of mechanical milkers in herds of fair size.

COWS TAKE KINDLY TO MACHINES.

The first question that is generally asked by an investigator is: "Do the cows object to the machine?" No! The milking machine imitates nature so closely that cows very quickly adapt themselves to it; in fact, judging by the quiet way most of them stand, you would swear that the machine had fooled them into thinking that their calves were doing the work.

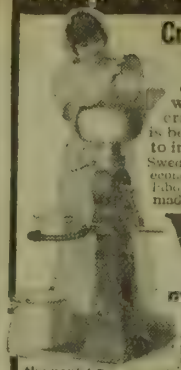
Occasionally a cow—usually an old one—objects, but for that matter it often takes cows several days to get used to a new hand milker, and if a reasonable amount of kindness and patience is used practically

Women are making good as milking machin e operators. This up-to-date milkmaid milks 55 cows twice a day, thus allowing her father to spend his entire time in the field.

WANTED

HONEST, competent milker wants job. Not subject to draft. Quiet, courteous, and contented. Does not booze, never sick, always on hand. Never abuses cows or strikes for higher wages. All it asks is to be kept clean and treated decently. Inquire of any dealer handling milking machines. He can tell you all about this faithful helper and solve your labor problem.

Stop Cream Waste!



Cream Means Dollars

IT is like throwing dollars away to waste cream these days. It is worse than waste—it is a crime. Yet good, rich cream is being fed to the pigs owing to inferior separation.

Sweden has perfected the most economical, fastest and easiest labor-saving cream separator ever made. This is world-famed

THIS BULL Will Increase Your Butterfat

He is out of a daughter of Prince Riverside Walker and is a typey son of Model Francis Glista. Both of the above bulls are out of great producing families. Write or come and see him and other Holstein stock we have for sale.

C. C. SLATER, Pacheco, Contra Costa County.

LibertyFair Postponed

The opening date for the California Liberty Fair at Los Angeles has been postponed from October 12 to October 26. However, the Livestock Show was not to have begun until the 20th, so there will be a delay of only one week. All barns are now ready and exhibitors who desire to ship earlier may do so. Let's all get together and make the fair all the better because of this unavoidable postponement.

every cow can be made to stand for machine milking and to give down her milk freely and fully. Records show that in many herds the production has been increased, and the cows have held up even better toward the end of the milking period, thus increasing the yield for the year.

This probably is because the mechanical milker is not subject to the physical strain of the hand milker and milks exactly the same at every milking. There is a limit to human endurance, and no man can milk the last cow in a string of thirty as well as the first. Furthermore, he may have his off days; he may hate certain cows; he may not be able to do good work with cows having small teats, and so on. But mechanical milkers are self-adjusting. All cows look alike to them, and they get good results whether the cows are hard or easy milkers, have large or small teats, are nervous or calm.

We have heard considerable about milking machines injuring udders, but if they are properly adjusted this cannot be proved of any modern make. The teat cup is even more gentle than the human hand, and machine milking will tend to put an end to udder troubles instead of increasing them.

MORE SANITARY MILK.

We hear constantly that milking should be done in small topped pails, or those protected by strainer cloths, but the milking machine beats any of these processes because there is no opening at all for stable dust and dirt to get into the milk. Consequently milk with very low bacteria count can be produced if the machine is properly cared for, but if it is not kept well cleaned it is far from sanitary, and the milk is not in as good condition as that drawn by hand. However, the modern machines are easily cleaned, and with a reasonable amount of common sense and painstaking care a superior grade of milk can be turned out.

FASTER THAN HAND MILKING.

Investigations carried on at both intensive dairy plants and mixed dairying and farming enterprises showed that the average time required for hand milking was about 7 minutes and for machine milking 4.15 minutes. Consequently, figuring that machine operators handle one double, three single or two double units at a time, it will be seen that a herd can be milked much more rapidly and with less help than by hand.

It is generally figured that one man can milk from twenty to twenty-five cows an hour. Often a boy is employed to carry the milk, and in such a case the number can be increased to about thirty by working more units at a time. All cows must be stripped by hand, not only because the strippings represent the richest part of a milking, but also because a cow will dry off to a certain extent unless she is milked clean at each milking.

HOW TO BUY A MACHINE.

Use the same business judgment in buying a milking machine that you would in buying a purebred cow. You are interested in other things besides the looks of a cow; you want to know about her pedigree and her record. Buy a milking machine the same way. Investigate its past record. Be sure that it has been on the market long enough to prove its worth. Find out which machines are standing up best under years of service. Get the different dealers to give you the names of users, and inquire into the effects of the machines on the herds—milk production, udder troubles, effect on lactation periods, etc.

Don't buy an outfit unless a guarantee accompanies it; and if the makers maintain a service department near at hand so much the better. A milking machine wouldn't be a machine if it didn't break down once in awhile, and if there is a local agent upon whom you can rely at all times for service it will save you many delays, losses and cuss words.

Don't wait to investigate until after your milkers have quit and you are right up against it and are forced to make the change. It is much better to investigate at your leisure and to give a machine a trial when you have plenty of help, and the necessary time can be taken to learn how to adjust and operate the machine properly.

Properly handled, a milking machine will convert a dairy ranch into a place of everlasting bliss. Without it, the place will be one of everlasting blister.

NAPA COW STILL GOING STRONG.

To stand and look at Raphaella Johanna Aaggie 3rd, quietly grazing in the alfalfa field on the State Farm at Napa, you would hardly suspect that you were looking at perhaps the most wonderful cow in the world. But such she is proving herself to be from these records, furnished by V. L. Heath, manager:

Record for seven days, 33.4 lbs. butter, 930.2 lbs. milk; best day's milk, 137.4 lbs. Thirty-day record, 129.6 lbs. butter, 3790.6 lbs. milk. Holds world milk record for 157 days by a margin of 290 lbs. Made an average of 96.4 lbs. milk per day for the entire 265 days on test. Best seven-day butter record, eight months after calving, 21.9 lbs.

Suppose you had a few cows in your herd even half as good as this one. There would be some increase in the size of your cream check, wouldn't there?

1918 GUARANTY HOLSTEIN SALE.

Following the annual meeting in September, President Fred W. Kiesel of the California Holstein-Friesian Association was empowered to appoint a committee of selection to pick out cattle for the 1918 Guaranty Sale. The committee, composed of H. V. Bridgford, James W. McAlister, Jr., Frank L. Morris and C. L. Hughes, has already begun its work and is reported to have secured the highest record Holsteins ever offered on the Pacific Coast.

The sale will be held at the State Fair Grounds, Sacramento, Thursday, December 5, and will be under the management of the California Breeders Sales and Pedigree Company. Fuller announcement will be made later.

THE NAPA COUNTY FAIR.

The Napa County Fair, postponed from August 23-25, was held last week. Difficulty in securing help affected the livestock show, so there was practically no competition. Fred Johnson and H. E. Boudier showed some good Durocs; Maplewoode Farm a few good Berkshires, including the junior champion at the State Fair. R. Frisbie showed Poland-Chinas. The Napa Hospital showed Holsteins and Wm. Mitchell, Jerseys. Philip Duffy showed Shropshire sheep. The poultry show was small but of good quality.

The following districts contributed to the agricultural and horticultural exhibits: Pope Valley, Oak Knoll, Coombsville, Fly, Carneros, Brown's Valley, Salvador and Soda Canyon.

Recently the California Central Creameries Company of El Centro introduced a new plan of issuing cream checks weekly. The plan has met with the hearty approval of dairymen and is already being considered in other sections.

Don't Miss

the exhibit of Beef Cattle at the California International Livestock Show.

Practical patriotism—if nothing else—should prompt you to come and see what is being done—what *you* can do—to improve the livestock production of the nation.

There will be REAL Competition

not only in the Beef classes but in the Dairy Breeds, Hogs, Sheep, Horses, Poultry, etc. $38,000 in Premiums.

Special features: Night Horse Show, Band Concerts, Military Spectacles, etc. Every possible comfort for exhibits, exhibitors and spectators. You'll be welcome!

Special railroad rates from all points

The World's Greatest Swine Show

[Written for Pacific Rural Press.]

The third National Swine Show and Exposition, held at Cedar Rapids, Iowa, September 30 to October 5, proved to be the greatest swine show the world has ever seen. In numbers the exhibits were nearly identical with those of the two previous shows held at Omaha, but the quality far exceeded that of either. The judging found some of the greatest specimens of hog perfection that we have had in the swine rings of America, and the crowds were much impressed with the great size and the high excellence of the exhibits.

The exposition features of the show were a splendid success. The Hog Chautauqua, which presented a number of very high-class features of entertainment and swine husbandry instruction, was undoubtedly the most talked of part in the exposition. The ham and bacon show created a great deal of favorable comment, and the corn show was excellent.

The display of hog farm equipment proved a real feature. There were many commercial firms with exhibits of improved hog farm equipment, serums and the like that found the crowds greatly interested in the products they had to exhibit.

There have been many swine shows in the past, but never before has one been so well attended and never before did the spectators seem so eager to learn. They took many valuable lessons home with them.

The grand champions were as follows: Poland-China — Boar, Black Prince, W. J. Graham, Howard Lake, Minn.; sow, Josephine 1st, Charles E. Lyden, Manning, Ia. Berkshires —Boar, Royal Superbus 2nd, W. S. Corsa, White Hall, Ill.; sow, Superb Premier Princess, Piping Brook Farm, Greenwich, Conn. Duroc-Jerseys—Boar, Great Orion, E. M. Kern, Stanton, Neb.; sow, Orion Lady, Pine Crest Farm & Jackson, Charleston, Miss. Chester Whites—Boar, Wildwood Prince, Maurice F. Black, Scribner, Neb.; sow, Miss Lenora 4th, W. T. Barr, Ames, Ia. Hampshires—Boar, DeKalb's King 160th, H. D. DeKalb, DeKalb, Ia.; sow, Trixie Lookout, Wickfield Farms, Cantril, Ia. Yorkshires—Boar, Oak Lodge Sardis 31, B. F. Davidson, Menlo, Ia.; sow, Deer Creek Bonnie, B. F. Davidson, Menlo, Ia. Tamworths—Boar, owned by Maynard Thomas, Iowa City, Ia.; sow, owned by Geo. I. & P. Owen Morris, Aledo, Ill.

Hanford Sale a Grand Success

[Written for Pacific Rural Press.]

The sixth semi-annual sale of the Kings County Poland-China Breeders' Association, held at Hanford, October 9, brought out a large crowd and a goodly number of buyers. They were real farmers, who bought conservatively and got big value for their money.

The stock consigned by John M. Bernstein topped the sale with five animals averaging $143. M. Bassett & Son were next with seventeen head averaging $110. Two head consigned by H. D. McCune averaged $107.50; five head by W. L. Haag & Son averaged $101.80, and ten head of young stock by W. Bernstein averaged $91.

The top animal of the sale was a wonderful sow, Hadley Queen, consigned by W. L. Haag & Son, which brought $265. The entire 73 head averaged $90. A Red Cross sow donated by W. L. Haag & Son sold to D. C. Johnson, Stratford, for $150.

The heaviest buyer was G. A. Ritchie of Hanford, who bought fifteen head and used exceptionally good judgment in his selections. Several new buyers were noticed, among them the W. S. T. Co. of Madera, which purchased ten head of good ones. Other prominent buyers included Thomas Caesar, Reedley; Frank Johnson, Hardwick; Goodman Bros., A. J. Elliot, J. H. Hanschaldt and C. O. Riley, all of Tulare; J. F. McSwain, E. L. Morley and M. Cross, Merced; J. T. Wilkinson, Grangeville; J. C. Sorrick, C. G. DeRaad, Lemoore; G. B. Martin, Visalia; Claud Richardson, McFarland; H. Jorgenson, Kingburg; E. S. Myer, Riverdale; B. Smith and G. W. Pfost, Laton; F. E. Fay, Tipton; and W. Bernstein, W. L. Haag & Son, A. R. Waltz, S. D. Vanbeck, T. B. Hooker and C. A. Vaughn, all of Hanford.

DRASTIC DAIRY PRODUCT RULINGS.

Food Commissioner Ralph P. Merritt announces that to stabilize butter prices the San Francisco and Los Angeles dairy produce exchanges have agreed to trade in butter only once a week, instead of every day, for a period of thirty days. The purpose is to stabilize the price for each week, in order that the retailer who is allowed a margin of 5c and 6c a pound may sell butter at a stable price for the week, and thereby avoid uncertainties and frequent fluctuations.

The present high price reflects an increasing return to the producer. The Food Administration does not wish to decrease this return to the dairyman, who is having great difficulty in maintaining his herd because of high prices of feed and scarcity of labor, and it is possible that the present price may go even higher, due to the increasing scarcity of butterfat and the larger demand for butter for army and navy uses. The army has recently taken 60 per cent of the entire butter stock in the United States.

To help relieve the butter shortage the U. S. Food Administration has issued orders prohibiting licensed distributors from selling cream containing more than 20 per cent butterfat. This order constitutes the first direct blow toward the elimination of table luxuries. Homes, public eating places, clubs and hospitals will be affected by the order, which automatically abolishes whipped cream and "double cream." Experts say cream containing only 20 per cent butterfat cannot be whipped without the addition of white of egg. The ordinary table cream sold in California contains between 30 and 32 per cent butterfat, while that used for whipping and similar uses contains between 37 and 38 per cent butterfat.

It is expected that this ruling will release for butter making a great quantity of butterfat now going into the sweet cream trade.

NEED LIVESTOCK MEN AT HOME

SERIOUSLY, is it for the best interests of the Government and our State to allow our livestock men to be drafted? The shortage of meat and dairy products is becoming more acute every day. These foods are just as necessary as bullets in winning the war, yet it requires experienced men to raise livestock successfully, and a reduction in herds must result if these men are taken.

It is not a question of loyalty. These men are ready and willing to go; in fact, many have already gone. In some cases expert herdsmen have been taken away; in other cases the owners themselves have been drafted. The result—herds that represent years of constructive breeding are being sold off and our State is being deprived of the services of these men who are needed much more here at home to fight against scrub stock than they are on the European battle front to fight against the Huns.

Livestock breeders, it is up to you to get together so that you may impress upon exemption boards the importance of this matter and, if necessary, take it up direct with headquarters at Washington. You realize the seriousness of the situation, but that is not enough. You must make the authorities realize it. The appeal of an individual will have little influence, but that of a group representing the leading breeders of the State will carry great weight. Get together at the Los Angeles and San Francisco shows. Pass some strong, convincing resolutions. Send them to the exemption boards and to Washington. Give them wide publicity. We'll help you. Don't allow the very life-blood of our livestock industry to be sapped away.

Riverside Fair Brings Out Quality Stock

[Written for Pacific Rural Press.]

The livestock shown at the recent Southern California Fair at Riverside surprised both directors and spectators. It was a quality show, and prominent breeders stated emphatically that had many of these animals from local herds been shown at the State Fair they would have been within the ribbons.

In the dairy classes there were good showings of Holsteins, Jerseys, Guernseys and Ayrshires, and the competition was keen in nearly all rings.

Hogs were there in great numbers, Poland-Chinas, Durocs, Berkshires and Hampshires being represented. There were several Durocs and Poland-Chinas weighing close to 1000 pounds.

The exhibits of beef cattle, horses, mules, jacks and jennets were all good, and a showing of over 125 boats attracted considerable attention. Poultry, rabbits and pigeons were shown in large numbers.

The attendance was large. Elaborate plans had been made for entertaining the spectators, and everyone who attended had an enjoyable, profitable time. Great credit is due the directors for the success of the fair.

ANNUAL MEETING OF CATTLEMEN'S ASSOCIATION.

At the annual meeting of the California Cattlemen's Association, held at the Palace Hotel, San Francisco, on Saturday last, October 12, many interesting matters were discussed. President Nares informed those present of the necessity of consolidating the organization plan approved at the Davis convention, informing his hearers that meetings of all of the county organizations, a total of 43, were to be held prior to October 31 to ratify county constitutions and by-laws and elect delegates to the zone conventions to be held at (Zone 1) Redding, Tuesday, November 5, 10 a. m.; Willows, Thursday, November 7, 10 a. m.; San Francisco, Saturday, November 9, 10 a. m.; Fresno, Saturday, November 2, 10 a. m.; Los Angeles, Wednesday, October 23, 10 a. m.

The amended articles of incorporation and revised by-laws of the California Cattlemen's Association were ratified at the meeting. Secretary Stollery informed the meeting that the association membership now numbered 557, representing 297,350 head of cattle, and that it was contemplated that this would very materially increase as soon as the county and zone meetings were held. Interesting addresses were made by H. A. Jastro and Professor Gordon H. True.

J. H. Cook, Paradise, has sold a fine bunch of Poland-China gilts to Chas. Gatewood & Son, Fresno. Also, in addition to the Caldwell's Big Bob boar that we recently reported sold to C. Roy Marshall, Sebastopol, Mr. Cook has sold Mr. Marshall two very fine gilts.

Live Stock and Dairy Notes

Livestock breeders all over the State are invited to send, on postal cards, notes regarding their sales, State and County Fair intentions, new stock, etc.

LIVESTOCK SALES DATES.

Nov. 7—Shorthorn Association, International Livestock Show, San Francisco, Shorthorns.
Nov. 8—Hereford Association, International Livestock Show, San Francisco, Herefords.
Nov. 12—A. W. Morris & Sons, Woodland, Holsteins.
Nov. 21—Fine Tulare Sale, Tulare, Holsteins.
Dec 5—1918 Guaranty Sale, Sacramento, Holsteins.

The Dairy.

F. A. Zimmerman, Novato, has recently purchased from Gage Bros., Novato, the registered Holstein bull, McCloud Beauty Ormsby, to build up his large herd of grade Holsteins.

At the State Fair J. E. Wherrell of Riverside showed the first four calves sired by You'll Do Oxford and won both junior championship and reserve grand championship and three first prizes. Out of the first twelve calves sired by this bull eleven have been heifers.

The Associated Dairymen of California now have men in the west-side dairy counties of the San Joaquin Valley, from Los Banos to Patterson, to form a Milk Producers' Association similar to those already operating in other parts of the State. Excellent progress is being made.

Gridley will have a milk evaporating plant in the near future, as the Felleman Dried Milk Products Company was recently incorporated, has leased a building in that city and will soon equip it for the evaporation of milk. The officials plan to operate on a large scale, and state that they will pay good prices for milk.

The Northern California Milk Producers' Association is enlarging the recently purchased plant at Orland at a cost of $8,000. The improvements will increase the capacity to 7000 pounds of butterfat daily. In addition to the making of butter, the directors plan to add milk condensing, cheese-making and casein equipment. It is proposed to make this plant a great central one for Northern California.

H. W. Gossard, owner of the noted Indiana Berkshire herd headed by the English boar, Epochal, who has been in the limelight so much recently, has closed a deal whereby he purchased from J. W. Clise, Redmond, Wash., 84 cows in milk, 12 heifers and 4 bulls from the Willowmoor herd of Ayrshires. This transaction is the most notable one ever recorded in Ayrshire history. Mr. Gossard also made an extensive draft from the herd of E. B. McFarland, San Mateo.

Toyon Farms, at Los Altos, has four cows on test at present and more will be started later. Their herdsman, Charles McDonald, says he has good stock to work with and he certainly knows how to get the most out of them. Among the most promising cows are LaConner Pontiac Lass, with a record of 21.2 pounds in seven days with first calf; Valdessa Clarkhurst Pietertje 2nd, with 25.8 pounds in seven days as a junior three-year-old; LaConner Pontiac Helene, first and junior champion at Portland in 1916; LaConner Pontiac Bess, first in her class at Portland; Ormsby Segis Marie, the $12,500 heifer that made 1053 pounds of butter in one year with second calf; Turndale Countess De Kol, thirteen years old, with two 30-pound records already to her credit, and promising to do even better during her next period. We shall watch the results of this testing with great interest.

Beef Cattle.

Reynolds & Son and Lonquist Bros. of Hat Creek are the proud possessors of a fine purebred Red Polled calf sired by the grand champion at the P.-P. I. E. When ten months old he weighed 790 pounds. These same owners have seven other good ones and are developing a fine herd.

The Rancho Del Rio, located eight miles northwest of Oakdale, is owned by Frankenheimer Bros. and consists of 7000 acres. They have it stocked with one of the best herds of grade Shorthorns in the State. They made their start in 1904, and have used registered bulls ever since, maintaining a herd of 22 registered cows for this purpose. Their cattle are range fed but look as good as the average stall-fed stock. They feed from 1500 to 2000 cattle each winter and have everything arranged on a practical, systematic basis.

Swine and Swinemen.

J. E. Thorp of Lockeford has sold his entire Berkshire herd to Sam Elder of Selma.

R. W. Jickling, Elmira, has sold a fine Poland-China herd boar to the American Beet Sugar Factory, Chino.

Dr. J. A. Crawshaw, Hanford, reports the sale of a boar to W. H. Bennett, Porterville, and a bred gilt to Bush & McCready, Graton.

J. P. Mallory of Fresno made several good sales of Durocs during the Fresno Fair. He recently sold the brood sow, Lady Midnight, for $250.

Conejo Ranch, Newbury Park, has sold to F. M. Johnson of Napa a pair of two-year-old Golden Model brood sows that are considered very fine.

B. M. Hargis, Tulare, has added several Poland-Chinas to his already good herd and purchased some fine brood sows at the recent Trewhitt sale.

A. Buckland & Son, Fresno, report the sale of a Poland-China boar and a sow to Wm. Bernstein, Hanford; a boar to E. E. Lapelle, Carruthers, and a boar to Fred Wheaten, Helm.

Ben Desart, who has been herdsman at Maplewood Ranch, Calistoga, has been engaged to take charge of the fine herd of Berkshires being established by H. C. Muddox of Sacramento.

At Corcoran a sale of fat hogs was recently held under the auspices of the County Farm Bureau, at which the hogs offered were guaranteed to be free from disease, including tuberculosis. The top carload brought $17.80 per hundred.

Elmer Lamb of Ceres reports recent sales of registered Durocs as follows: George Wingfield, Reno, Nev., boar; Spreckels Sugar Co., King City, boar; H. K. Stevinson, Merced, boar; Ford Ranch, San Fernando, boar; Chas. Silva, Sacramento, sow; H. K. Nourse, Walnut Creek, sow; Dave Rogers, Gazelle, boar and sow; Lydia G. Wild, Lancaster, sow; S. K. Kelsley, Ceres, sow.

Sheep.

A. Z. Jones of Lower Lake has just sold 700 head of sheep to Mr. Brown of Vallejo for $11.50 per hundred.

J. R. Allen, a leading Cotswold breeder, who attended the Salt Lake ram sale, stated that last year he sold $240,000 worth of registered sheep and that the trade so far this year has been even better.

A campaign has been started in Sonoma county to secure pledges from the farmers that they will raise more sheep. Many signatures have already been obtained. The Food Administration is prompting the action.

Farmers of Stanislaus county have received four carloads of sheep from Sacramento county, purchased by Prof. Miller of the University Farm, in connection with the Liberty Flock Drive started by the Government some months ago. The Farm Adviser has pledges from 43 farmers to keep flocks of sheep, the total being 2391 head.

The last one of the Dimmick brothers of Hanford joined the colors last week. This makes three boys that have been taken. Mr. Dimmick, Sr., will run the farm in the absence of his sons and will try to keep their excellent Poland-China stock in fine shape until their return.

P. E. Mitchell, Atwater, showed eight of his Poland-China hogs at the recent Atwater Fair, and took nine ribbons home with him, including both grand championships, four firsts, two seconds, and one third. This speaks pretty well for Mr. Mitchell's hogs in competition with thirty others.

M. Bassett, Hanford, has sold to D. Evans, Mesa, Ariz., a young Model Fellow boar named Bonita Model, weighing 230 pounds at six months. Mr. Evans has purchased three boars from Mr. Bassett in the last three years and has won three grand championships at the Arizona State Fair with them.

At a meeting of the directors of the fifteen Farm Centers of Shasta county it was decided to adopt the plan of having auction sales of hogs which has proved such a success in Kern, Kings, Tulare and other counties. The first sale will be held at Bartle in October and the second at Cottonwood in December.

R. J. Merrill & Son, Morgan Hill, have recently made the following sales of registered Berkshires: One gilt to A. H. Mofatt, Los Altos; one boar to G. P. Spotorno, Pleasanton; one bred gilt to F. U. Lefever, Marysville; one boar to J. W. McClay, San Jose; one boar and two bred sows to Sam Martin, San Jose.

Howard C. Peterson, the live-wire Poland-China breeder of Reedley, writes us that the Rural Press certainly gets the business and that he has recently made the following sales through the paper: Brood sows to W. Bernstein, Hanford; G. T. Duerksen, Dinuba; Wm. Stohl, Reedley; gilt to C. B. Jensen, Parlier; sow pigs to G. T. Duerksen, Dinuba, and Gilbert Hoskins, Parlier; two sow pigs each to C. B. Jensen, Parlier; A. D. Keisler, Esparto; W. Bernstein, Hanford; boar pigs to Peter Miller, Reedley; G. T. Duerksen, Dinuba; Gilbert Hoskins, Parlier; two boar pigs to C. B. Jensen, Parlier.

Imported and American Bred Stallions
Percherons - Belgians - Shires

My Fall shipment of stallions has arrived. These horses were personally selected by me in the best breeding districts of Iowa, Illinois, and Indiana. Two, three, and four-year-olds that will weigh a ton or over.
The largest collection of Percherons, Belgians, and Shires west of the Rocky Mountains. State certificate of soundness and life insurance with each stallion. Every horse priced to sell according to his individual worth. Any reasonable terms will be given. I also have a carload of Heavy Draft Mares and Geldings for sale—age 4 to 7 years, weighing from 1400 lbs. to 1700 lbs. Matched teams in black, bay, or chestnut.
Correspondence invited and visitors always welcome.
N. W. THOMPSON, Patterson, Stanislaus County, California

CLOSING OUT . . DUROCS
Owing to ill health and scarcity of labor, I am offering my entire herd of Durocs for sale. They consist of 13 tried sows, 8 fall yearling gilts not bred, 2 bred gilts, 42 March gilts, 3 March boars, 2 aged boars, 1 yearling boar and 10 July pigs. These are all high-class hogs, smooth, easy feeders and either registered or eligible to register. Many are high prize winners at the different fairs of the State. Anyone who can handle the entire lot can get them for little advance of the market price.
ELMER LAMB, = Ceres, Cal.

The Sheep that bring the Big Prices are the kind to buy
Rambouillets
I purchased at the Salt Lake sale 31 head of the best (Butterfield, Quealy and Bullard strains) to head my breeding ewes. I have about 100 big, smooth, heavy-wooled rams for sale.
J. BIDEGARAY FRESNO, CAL.

FINE WOOL HEAVY LAMBS
Big, smooth-bodied, heavy wooled Rambouillets of the best breeding. I have used only registered rams on my original foundation of purebred ewes and their offspring. A few choice yearling rams for sale. Write for their breeding or come and see them.
E. C. SPEAR, St. Helena

HEREFORD SALE AT SAN FRANCISCO SHOW.

A sale of registered Herefords will be held by the Pacific Coast Hereford Breeders' Association at San Francisco, Friday, November 8, in connection with the California International Livestock Show. About forty head will be offered, made up of consignments from California breeders, together with consignments from John Painter & Sons, Colorado; Hereford Corporation, Wyoming, and Cazier & Sons, Nevada. The largest part of the offering will be two- and three-year-old heifers, many of them bred. An excellent opportunity will be offered California breeders to increase their herds with outside strains of good blood lines.

NEW CALIFORNIA MARKETING ASSOCIATION.

Visalia has been made the headquarters of the new California Farm Bureau Marketing Association for the members of the farm bureaus of Fresno, Tulare, Kings, Kern and Madera counties. This central bureau plans to handle train lots of cattle, hogs and other farm produce for bureau members.

LIVESTOCK DIRECTORY.

SWINE

Poland-Chinas.

I AM IN CLASS 1 IN THE DRAFT, so will sell my 20 head of registered Poland-China hogs. They are of the best blood lines and breeding obtainable, such as the Giantess strain, the Big Jumbo, Big Timm, Big Bone, Young Jumbo, President and Longfellow strains. Poultry for Profit

By Susan Swaysgood, Pomona.

ELECTRIC LIGHTING FOR EGG PRODUCTION.

The electric lighting of poultry houses is coming to the front again with increased interest. All who tried it the last two seasons are of the opinion that it pays to furnish the hens with a longer business day during the winter months. The cost of wiring and electricity will depend on locality.

PUT THE LIGHTS IN EARLY.

Those who put the lights in last year about Christmas are of the opinion that, provided one intends putting them in, it pays to get the work done while the nights are comparatively long. Then hens will not be disturbed by starting in with long nights and then changing to short ones. This is a reasonable idea, because laying hens are so temperamental that a very little change out of the natural order of things upsets them. George Newell of Chicago claims to have more than doubled his egg production with hens, a greater part of them one year older than those he kept accounts of the year previous to putting in lights. With feed prices fairly reasonable and eggs soaring, it looks as if it would be a paying investment this winter to make the hens believe in an extended summer season. We have fooled them into doing many stunts their forbears never dreamed of, and it can be done again. All hens that are partially or fully molted can be made to give a good account of themselves.

GIVES LONGER FEEDING TIME.

Now, everybody will not be able to get electric-lighted houses, but everybody can utilize all the daylight we have to the best advantage and get quite an increase of eggs by exercising a little care and forethought. The real purpose of the longer day is to give the hens an opportunity to eat more; so if the poultryman will see to it that from early morning till late at night his hens are kept busy, and so arrange his feeding that the hens will digest the day feed, then by feeding corn at night, all they will eat, his hens will be able to go through a fairly long night without being hungry at all. About noon feed a little warm, moist mash, just enough to last them ten minutes or so, and let it be in a crumbly condition—not wet. This is in addition to what dry mash they will eat; then by feeding corn at night and leaving some grain in the litter where the hens can find it as quick as they get off the perch in the morning your hens will have a fairly long day to eat in.

KEEP THE HENS' FEET DRY.

With the price of feed fairly stabilized and eggs still soaring, it will surely pay to take a little extra trouble to get them. Don't be in a hurry to turn your poultry out on a cold, damp morning. Leghorn hens take cold through the feet more quickly than any other way, and cold feet means slowing up of egg production every time. Keep the feet dry and a Leghorn hen will start the blood into activity in a few minutes.

HENS NEGLECT BUSINESS.

To the Editor: What should I feed my hens and young pullets? They have not laid for the last three months. I have been feeding whole barley and soaked it, too, and bran and midds mash, but they don't seem to know what I want.—Subscriber, Tulare.

[Unless the pullets and hens can get some kind of animal food, you should feed some beef scrap, fish meal or sour milk, it does not matter much which. Another thing that is good to start hens that have forgotten what they are fed for is bone. You can get granulated bone, any size, at feed stores, and if you put it in a box or hopper the hens will soon find it. Provided you feed enough barley, it is likely lack of animal food that is keeping them back.]

THE ELUSIVE CHICKEN MITE.

A few days ago I was invited to look at a neighbor's chickens and was no sooner in the building than I asked point blank, "Haven't you got mites?" "No," the man said, "I have not had a mite on the premises this year." I told him he was surely mistaken, for nothing but mites could cause those fine looking pullets to look so pale about the head; so, with his permission, I went on a tour of inspection and I did not have to travel far to find game. Pretty soon I was scratching and feeling around my own neck, too. Well, Mr. Man was surprised, but he got busy, sprayed everything with distillate, and he tells me he will continue it for a week or more until he gets all of them.

Whenever pullets or hens that are being fed decently take on a pallid appearance and move around as if they had no life in them, you should go on a tour of inspection and find the cause. There is always a cause behind these things, and until you reach it very little can be done in the way of curing it. It never pays to be too sure of anything.

When that man was obliged to look at the hordes of mites he was boarding on his inoffensive chickens, he kept a still tongue in his head and only said "yes" and "no" when asked questions. And the worst of it is that only a few short weeks ago he stopped his Rural Press, saying he "could not afford to take it." He has probably changed his mind by this time.

LIMIT YOUR YARDS AND VARIETIES.

To get the best results from layers, winter or summer, don't have too many in one house or yard. Fifty Leghorns or any of the small breeds do much better than a larger number, and 25 do better still. Twenty-five hens given the room and two-thirds the feed of 50 will produce quite as many eggs as the 50, and you can have the money for the rest to use in your business. Fifteen of the heavier breeds do better than 25, though the latter number do well; but more should never be run together. A fad of mine when I bred nothing but Orpingtons was to have small matings. Never more than eight or ten in one house and yard—ten was the limit. And for months together my hens would give me all the way from eight to ten eggs from the ten-hen yards and from six to eight from the smaller number. When a hen got broody I simply changed her from one yard to the other, and as the old residents picked on the newcomer she soon broke up and could be returned to her own yard.

When more than one or two varieties are kept it means much more work to keep things moving and still have the pure strains; it means a much larger capacity of house and yard room, and unless one has it the average farmer had better content himself with one good breed.

THE GREEN FEED PATCH.

There is not any limit to the green feed that can be grown in counties that have been favored with rains. Our rain has not more than laid the dust, but we can always irrigate, and the growing of green feed is not much of a problem to those who have land and water. And it is a sure thing that a good patch of green feed lightens the feed bills and keeps the flock healthy, not to speak of the larger egg production.

Hens should eat at least four times the quantity of greens as of all other foods combined. Feed the green mash liberally in the morning and at noon. Hens will eat with avidity greens coated generously with middlings, and will make a record as layers.

A PRACTICAL EDUCATION IN POULTRY BREEDING.

Farmers will find a means of practical education in poultry breeding at the Poultry Division of the San Francisco Livestock Show, November 2-10. In response to special requests by the Food Administration and the U. S. Department of Agriculture, George H. Croley, the show secretary of the San Francisco Poultry Association, is striving to make the show—particularly from an educational point of view—the best ever held in San Francisco, not excepting that held at the Panama-Pacific Exposition.

HOME CIRCLE

FROM DAY TO DAY—MIRAGE.

The sun beats through the noonday's calm
And, deep in the desert's glare,
Mirage of sea and sails and palm
Quivers and floats in air.
Dissolves and shifts, descends and lifts,
Now indistinct, now plain,
As in glamour of dream forever I seem
To see my Home again.

Our ordered tents are row on row—
(The Mirage flickers anew)
Are these camps or Syrian hills in snow
White peaks that stab the blue?
Are the sails on the seas of the Hebrides
And the trees from a Highland glen
In this blinding glare? Yes, surely there
I see my Home again.

And my heart is far in the Rossshire hills
Swathed scarf on scarf in mist,
Where a tawny burn its tribute spills
Through the heather's amethyst.
And the breath of the moor is keen and pure
As the clouds blow past and the rain—
Dear God! let me stand in my own clean land
And see my Home again.
—Member Egyptian Expeditionary Force, in London Observer.

GREAT-GRANDMOTHER'S BISCUIT PARTY.

"Grandmother, you said you'd tell me a story." Beata patted great-grandmother's hand persuasively. "Please, grandmother, tell me about the old frying-pan I found in the attic yesterday, and—Oh, wait a minute; let's measure it. Why, grandmother, it's most as big as the top of mother's stove, and the handle's taller than you are when you're sitting down!"

"It certainly is a huge pan," laughed grandmother. "When I was a little girl like you there were no stoves in this part of the country, and my mother—your great-great-grandmother—did all her cooking with this frying-pan and a tea-kettle in a big fireplace.

"This old frying-pan was kept pretty busy when I was a child, and I'm going to tell you how it once helped save the material for a dress for me.

"The first winter after we came to Ohio was very cold. Our house was a log cabin with only one room. Across one end of the room were two beds curtained with sheets; at the other end was a big fireplace. We had no trouble keeping warm, but sometimes we had very little to eat. All winter we had for bread only cornmeal mush or johnny-cake, and frequently very little of that. Our neighbors were no better off than we were. Father had a little wheat that he brought from the East, so, in the spring, when the heavy snow melted, he took it to the nearest mill—fifteen miles away—and had it ground.

"In those days people shared their good things with their neighbors. Any kind of bread made from white flour was a great luxury, so mother invited the nearest family to spend the evening and eat biscuits with us."

"Grandmother!" cried Beata, with much concern, "didn't you have anything to eat but biscuits?"

"Yes, dear, we had bear meat roasted before the fire and potatoes baked in the ashes and hickory nuts and walnuts in place of fruit. We thought that was quite a spread. You may be sure that it was an event for us youngsters. Biscuits were as great a treat to us as candy or ice-cream is to children now; and we could hardly wait until they were ready. It was slow work, too, for we had only this frying-pan to bake them in. A few biscuits were put into the pan and placed before the fire; as soon as they were baked, another batch was put in, and so on until enough were baked to serve the company. We children had to wait until the second table, and while the grown people were eating, Sister Sarah baked biscuits for us. I was the youngest of the children, and although I was very hungry, I was also very sleepy; so I quietly slipped over to one of the beds, crawled behind the curtains, and went sound asleep.

"When the children's supper was ready, I was nowhere to be found. We had no candles then; our lights were sticks of hickory bark. Mother picked up one of these sticks and came to the bed—I think she knew where to find me. Just above the bed hung a 'head' or bunch of flax ready to weave into dresses for sister and me. Mother held the torch a little too high, and in an instant the flax was ablaze! Then there was plenty of excitement. I got out of that bed in a hurry. Father grabbed the burning flax and threw it outdoors, and Sarah, who had just finished baking the last batch of biscuits, ran out with the frying-pan in her hand and began to beat the blaze with all her might, sending the biscuits flying in every direction."

Beata's eyes were dark with sympathy. "I'm sorry you lost those biscuits, grandmother."

"Well," replied grandmother, "it was a loss, but Sarah saved the flax, and we thought we were very lucky to have that, even if we did lose a few biscuits."—R. E. Farley.

TOMATO PASTE.

Boil the tomatoes until soft. Crush thoroughly and put through a fine sieve. Place the pulp and juice in a shallow pan and boil gently over a slow fire until thick. Then place over hot water or in a slow oven, where it should evaporate until it reaches the consistency of peanut butter. While still hot, add two ounces of salt to a gallon of the paste and pack into hot scalded jars or bottles. Sterilize in wash boiler from half hour to an hour.

To make dried paste, spread the paste in thin sheets on plates or pans and dry thoroughly in a very slow oven, until it can be cut in squares or rolled in sheets. Store in moisture-proof containers.

Flavored tomato paste should have added to one gallon of pulp two sliced onions, two buttons of garlic, one bay leaf and two or three Chili peppers. After cooked down to a paste, beat in olive oil and salt to taste and sterilize as directed.

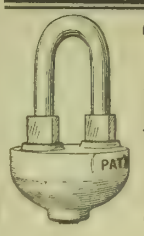
Tomato paste may be bottled in any size or shape jar and is a great time saver for use in soup and sauces.

UNCERTAINTY.

"Are you engaged in a useless occupation?"

"Sometimes I is," replied Mr. Erastus Pinkley, "an' sometimes I isn't. It all depends on how dis mule I's drivin' happens to be feelin' 'bout de matter."—Washington Star.

Say what you will—if the shipyard workers worked as long and as faithfully as the farmers do the shipping question would be settled.



"A Man's Work Is From Sun to Sun"
But Mothers?—Is It Ever Done?

Of course someone must saw and split the wood and carry it in, but then mother, bless her heart, must begin to everlastingly poke it in, clean up the muss and while she is "resting" carry a good portion of it out in the shape of ashes—more muss.

All to what end? Heat, of course. But, aside from that, all her work results in dirt, smoke and soot—a tremendous loss in itself, as well as the heat that has to be permitted to go up the chimney in order to get the semblance of a clean fire—one continuous loss from start to finish—and the finish is not at the moment heat is no longer needed, but when the fuel has burned itself out.

All this is so easily changed in the making of clean gas from coal oil with a "Premier" burner—in the same stove, with no alterations or changes. It's economy and conservation from start to finish. A clean, even heat all of the time up to the moment fire is extinguished, then it is out immediately—the expense has been stopped.

Styleplus make both sides of your dollar count

Good resolutions for every man to make in these war times are:

"I will buy only the clothes that I *need*.

"I will pay the price that brings genuine quality—*and not one cent more*."

Every dollar you spend should count. Count for you and country.

You will be stylish and thrifty *both* if you buy Styleplus Clothes.

You get reliable quality and style at a nationally known price—*a sensible, medium price*.

By making only a few standard grades in big volume we reduce costs and produce clothing values justly famous with well dressed and economical men.

Correct style. Careful tailoring. Finished workmanship. Faithful wear. Known price.

The best place to buy clothes is at a store, where you can see the different styles, make your selection and get a good fit.

You buy with both eyes open at the Styleplus Store!

Two grades in Styleplus suits: $25 and $30.

Three grades in Styleplus overcoats: $25, $30 and $35.

Sold by one leading clothing merchant in most cities and towns. Write us (Dept. A A) for Styleplus booklet and name of local dealer.

Agricultural Summary

Berry Growers State Their Case.

In view of some adverse comment in the public press reflecting on the marketing methods of the Berry Growers' Association, these facts were recently submitted: The present season opened with a very strong demand on their products for canning and preserving purposes and as early as April they sold to various canners a certain percentage of their estimated crop of strawberries at 7c per pound, net the grower. Later in the season this price was voluntarily advanced to 9c by a number of the canners. The minimum selling price per chest of $7 was not fixed arbitrarily by the association, but was based on the terms of this sale. The berry growers take the stand that they could not afford to sell selected berries, packed in baskets, at a price which would net the grower less than the canners are paying for field run berries. It is also contended that the minimum price of $7 per chest does not regulate the actual selling price of berries.

Retail Egg Dealers on the Grill.

There has been no little complaint that some retail dealers around the bay have been selling storage eggs as fresh and at fresh egg quotations. To make this matter clear to all concerned, the Food Administration defines a cold storage egg as follows: "For the purposes of the regulations governing wholesalers, retailers and all other dealers in cold storage eggs, cold storage eggs are eggs that have been held in a cold storage warehouse for thirty days or more at any temperature, whether above or below 45 degrees Fahrenheit." It is also complained that retailers have a careless habit of mixing up their pullet eggs with their full-size ranch eggs and charging customers full quotations for the latter class.

Dairy Activities.

The San Francisco Produce Exchange has closed its books for its fiscal year ending September 30. Its annual statement shows that during the preceding year it recorded a total of 14,785 sales on the floor of the exchange. This total is divided into 2859 for butter, 11,029 for eggs and 897 for cheese. Of these sales the heaviest number of transactions were in June of this year, when 1918 were scored, and the lightest in November of last year, when the count stood 693.

Increased Rates for Grain Storage.

Increased rates for grain storage in sacks were recently granted by the State Railroad Commission to the State Warehouse Co., which operates warehouses at Stockton, Marysville, Chico and South Vallejo. The new schedule is 50 cents per ton for one month, 75 cents for two months or fraction over one month, $1 for over two months, including season; weighing and delivering to craft, 20 cents; weighing and loading into cars, 25 cents.

Meat Markets in East Stagnant.

There has been a very severe curtailment of purchases of meats at the retail establishments in Eastern cities and it is surmised that the public is thus showing resentment at the attempted profiteering practices of the proprietors. Complaints of extortionate charges are also heard on the Pacific Coast — not only against retail butchers but purveyors of meat dishes in restaurants and other public eating places.

California's Raisin Crop.

It is estimated by the California Associated Raisin Co. that the State's raisin crop this year will total 130,000 tons or over. The crop last year totaled 163,000 tons. With the permission of the association, some few members disposed of their grapes to independent packers, on a basis of $60 to $70 per ton of dried raisins.

Stabilization of Hog Prices.

An effort to stabilize hog prices for the winter has been considered by the Food Administration at Washington.

THE MARKET REPORTS

Figures Given are Independent and Reliable.
Prices Quoted as Paid to Producers.

SAN FRANCISCO

San Francisco, October 16, 1918.

WHEAT.

The following prices of wheat are fixed as the minimum at which the farmers should sell in carload lots. It is understood that some farmers have been selling at a less figure and this is discouraged by the Government, which stands ready to buy at a minimum of $2 per bushel in carload lots f. o. b. at shipping point. The mills generally have been paying about these prices, which are quoted for the grain f. o. b. San Francisco, Los Angeles, Seattle, Tacoma, and Portland, carload lots. The price of sacks and sacking is not included. The price of wheat varies somewhat at different points more or less distant from the cities mentioned, but the Government guarantees not less than $2 as stated.

No. 1 hard	$2.20
No. 2	2.17
No. 3	2.13
No. 1 soft	2.18
No. 2	2.15
No. 3	2.11
Club or Sonora, No. 1	2.16
do, No. 2	2.13
do, No. 2	2.09

BARLEY.

There is no change in the barley situation. The Federal Grain Corporation has requested exporters to make offers of barley for shipment from Port Costa at $2.28 per cental for Superior No. 1 and $2.25 for Standard. These prices are for sacked grain, sacks to be in good condition.

Choice feed, per ctl	$2.10@2.15

OATS.

Oats are quiet. There is little grain of feed and little apparent demand.

Red feed, per ctl	$2.40@2.55
Red seed	2.90@3.10

CORN.

There were no developments in the corn market this week. Prices are nominal (First-hand prices on strictly first-class grain, San Francisco.)

California sacked	$3.90@4.00
Milo maize	3.95@4.05
Egyptian	4.05@4.10

HAY.

The receipts of hay for the past week were only 553 tons, compared with 761 the previous week. Most of the receipts were of hay which had been out in the weather and therefore damaged. It was sold at the best prices possible, but they ranged below the market in most cases. Hay out of warehouses is beginning to arrive in a small way. The few cars brought in to date were held at higher prices when sold, as accrued storage charges had to be met. Therefore quotations were higher this week on this class of hay.

Wheat, No. 1	$26.00@28.00
do, No. 2	22.00@24.00
Choice tame oat	25.00@27.50
Wild oat, new	22.00@24.00
Barley, new	22.00@24.00
Alfalfa	22.00@25.00
Stock	18.00@21.00
Barley straw	50@80c

FEEDSTUFFS.

There were no changes in prices for feedstuffs this week. The demand is only fair, as grass is having a wonderful growth practically throughout the entire State. Volunteer barley in some sections is as thick on the ground as if it were sown and up as high as a foot and a half at the present time. This is having its effect upon feedstuffs.

New alfalfa meal, per ton	$34.00@35.00
Coconut cake or meal	45.50
Cracked corn	86.00@88.00
Oilcake	78.00
Rolled barley	46.00@47.00
Rolled oats	56.00@57.00
Bran, carload lots in S. F.	23.75
Mixed feed, do, do	25.00
Middlings, do, do	25.75

POTATOES, ONIONS, ETC.

Potatoes continued on their downward track this week, the top price being only $1.90. Onions are without demand and receded in price. Reports from other sections of the country show that potatoes are still higher in the San Francisco market than in any other section and the tendency seems to be downward. According to best information the crop is way above the average for the past five years and the predicted high price for potatoes for next January and February will probably not materialize. Tomatoes are lower. Some fancy sold at a good figure. Sweet potatoes are more plentiful and sold at 50 cents a hundred lower. Garlic is strong and some fancy is reported sold as high as 20 cents, but the bulk went at quotations.

String beans	4@5c
Garden beans	6@7c
Wax beans, per lb	4@5c
Carrots, per sack	85c@$1.00
Rhubarb, San Jose, per box	$1.00@1.25
Summer squash	50@75c
Pumpkins	$1.00
Cucumbers, Alameda, lugs	75c@$1.25
Eggplant, per box	75c@$1.00
Lettuce, Sacramento, doz	15c
Celery, bunch	20@25c
Tomatoes, per crate—	
Bay	$1.00@1.50
Potatoes—	
Garnet Chile, on street	None
Whites	$1.85@1.90
Sweets, per sack	3.25@3.50
Onions—	
River Reds	None
Yellows	75c@$1.00
Australian Browns	75c@$1.00
Garlic, new	13@15c
Green corn, Alameda, per sack	Nominal
Okra	5@7c

BEANS.

The new crop of small whites made its appearance on the market this week. It is reported that the Government may not take many beans from California this year. It is now taking beans from Michigan and Idaho, where large crops were raised. According to dealers, there will be plenty of beans for Californians this year and the prices are more moderate than last year. Owing to Government restrictions on prices, there is practically no speculation in the commodity.

Bayos, per ctl	$ 7.75@ 7.90
Blackeyes, new crop	6.90@ 7.00
Cranberry beans	10.25@10.50
Limas (south, recleaned), new crop	11.50@11.60
Pinks	7.40@ 7.60
Red kidneys	Nominal
Mexican Reds	7.25@ 7.40
Tepary beans	6.25@ 6.50
Garbanzos	8.00@ 8.75
Large whites, new crop	9.25@ 9.40
Small whites, new crop	11.00@11.25

POULTRY.

Local receipts have been below the normal, but the arrival of two carloads from the East has furnished a supply which kept the market well supplied. A good demand is reported, and if Eastern shipments are not continued the scant local supply will cause higher prices.

Turkeys, live, young spring, lb	38@40c
do, old	35@36c
do, dressed, old	42@44c
Broilers, 1½ to 2 lbs	39@42c
do, 1¼ lbs	45c

do, old, per lb	25c
Squabs, per lb	55@60c
Ducks	29@30c
do, old	25@27c
Belgian hares	18@20c
Jack rabbits	$2.50@3.00

BUTTER.

Under mutual agreement between the Federal Food Administration and the San Francisco and Los Angeles Dairy Produce Exchanges, the market "call" on butter will be confined to one session a week, and commencing Monday of this week, October 14, a price was established for butter at which all sales on the exchange for one week must be made. This agreement was reached in an effort to stabilize the price of butter and to eliminate speculation. It is stated that a real shortage of butter exists on account of purchases for the army and navy.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extra	63	62	—	62½	62½	62½
Prime first	62	Nom.	—	61	61	61
Firsts	Nominal					

EGGS.

Eggs are skyrocketing in a rather remarkable manner. The receipts are showing a decided falling off, and the shortage is given as the legitimate reason for the steady advance.

	Thu.	Fri.	Sat.	Mon.	Tu.	Wed.
Extras	60	68	—	72½	72½	71½
Extra 1sts	Nominal					
Firsts	Nominal					
Extra pullets	60	59½	—	62	62½	63

CHEESE.

Cheese has been steady, with no changes in prices this week. Receipts have been normal and the demand is reported as only fair.

California Cheddar, flats, fancy	30½c
Fancy California flats, per lb	30c
First California flats, per lb	27c
California Y. A. fancy	Nominal
Oregon triplets, fancy	30c
Oregon Y. A. fancy	Nominal
Monterey cheese	24@27c

FRESH FRUITS.

Peaches are becoming scarce and are quoted at higher prices, and alligator pears showed an advance of from $1 to $1.50. There are still plenty of grapes, but the market is now practically confined to Tokays and Muscats.

Apples	$1.50@2.50
Peaches, 1 box crate	1.25@1.75
Figs, black, per box	None
do, double layer	75c@$1.00
do, Single Row Whites	75c@$1.00
Strawberries, per chest	$8.00@10.00
Raspberries, per chest	$8.00@10.00
Plums	Nominal
Cantaloupes, flats	None
do, ponies	Nominal
do, standard	Nominal
Watermelons, per lb	Nominal
Pears, Bartlett, per box	$1.50@2.50
Grapes, Tokay	$1.50@2.50
do, Muscat	1.50@2.50
Persimmons	1.00@1.50
Alligator Pears	4.00@5.00
Pomegranates, per box	$1.50

CITRUS FRUITS.

Valencias are nearing the end of their season and have been advanced in price to $9 and $10. There is little grapefruit on the market, but the new crop is expected to come in about the end of next week. Lemons were somewhat higher, especially fancy lemons, which were quoted at a dollar above last week.

Oranges	$9.00@10.00
Lemons, fancy	5.00@ 6.50
do, choice	4.00@ 5.00
do, standard	3.50@4.00
Grapefruit	5.50@7.00

DRIED FRUITS.

There is little that can be said of dried fruits this week. Apples are quieter than other descriptions, as the local dealers cannot buy in quantities as long as the Eastern prices are 2c or 3c less than California prices. However, the taking over of the prune crop by the Government has added great strength to other fruits.

DRIED FRUITS

Apples	14@15c
Pears	12@15c
Prunes, graded, price to growers:	
gain in dip	11c
Prunes, graded, prices to growers:	
20-30, inclusive, per lb	15c

RICE.

The first sales of paddy will probably be postponed until next week on account of October 12 being a legal holiday.

Paddy rice, 1918 crop	$4.32
Clear No. 1, 1918 crop, at mill	7.00

HONEY.

There are no changes in the honey market. The opinion is expressed that the present holders of honey in this city will have difficulty in disposing of their stock at a profit

HIDES.

Wet Salted Hides Per lb taken off from August 1 to September 1, all weights: No. 1, 19c; No. 2, 17c; No. 3, 16c.

Horse—Dry, per lb.: No. 7, large, $2.25@2.50; medium $1.75@2.25; small $1.00@1.50; salted, $3.00@5.00; colts, 25@75c.

Special Deciduous Market Report

By J. L. Nagle.

Sacramento, October 14, 1918.

There is little to add to what was said last week regarding conditions in all markets, as the comparison of sales and prices this week rule about the same, weak stock selling for little better than freight charges and sound fruit meeting with a very active demand and a strong market.

Most of the Emperor stock that is moving and that has been shipped is going into storage and very little of this variety is being offered on the auctions. If the weather does not interfere, later shipments of Emperors will bring unusually high prices. Malagas and Tokays have first call, but shipments of these latter two varieties will probably clean up within the next two weeks.

Averages for the week:

New York: Peaches—Levi, $1.70. Pears—Bartlett, $3.80; Easter Buerre, $2.70; Winter Nellis, $2.95; B. Hardy, $2.80; B. Clairgeau, $3.45; Morceau, $3.47; B. Bosc, $4.25. Grapes—Tokay, $1.86; Malaga, $2.02; Alicante Bouchet, $2.50; Mission, $1.94; Cornichon, $2.16; Muscat, $1.84; Zinfandel, 1.75; Emperor, $2.30.

Boston: Grapes—Tokay, $2.27; Muscat, $1.58; Cornichon, $2.38; Malaga, $1.80; Mission, $1.86; Emperor, $1.82. Pears—Comice, $4.25; B. Bosc, $2.97; B. Clairgeau, 4.50; B. Hardy, $3.85. Peaches—Levi, $1.75; Salway, $1.70.

Chicago: Grapes—Emperor, $2.11; Malaga, $1.81; Tokay, $1.58; Zinfandel, $1.34; Cornichon, $1.90; Muscat, $1.46. Peaches—Levi, $1.20. Pears—Bartlett, $3.10.

Shipments from October 3 to 10, inclusive: 74 cars pears, 2002 cars grapes. Shipments to date, 1918-19, 19,895 cars; shipments to date, 1917, 18,433 cars.

Special Citrus Market Report

Los Angeles, October 14, 1918.

Boston offered the high market in the East for Valencias last week and paid the highest prices for a carload of this fruit ever recorded in the history of California's citrus industry. This car averaged $16.40 per box for firsts, $14.95 for seconds, and $13.25 for thirds. It is reported that the car netted the growers $12.68 a box on the trees. There are now less than 100 carloads to go forward, which will likely be entirely cleaned up by the time the navels come in. Florida shippers are withholding quotations. They will probably get $5 per box f. o. b. this month and $4 next for fancy fruit.

The lemon market is growing stronger at all points, the prevalence of the influenza accentuating the demand. Quotations are on a basis of $4.50 to $5 f. o. b. and California is in a position to supply the demands of the entire country for this fruit.

Total shipments for the season are: Oranges, 14,602 cars; last season, same date, 39,246; lemons, 5690 cars; last season to date, 7579.

LOS ANGELES

Los Angeles, October 15, 1918.

BUTTER.

A higher market was had the past week under scarcity and what offering on 'change found quick sale. Receipts for the week only 217,800 pounds, against 270,800 pounds the same week last year. To make up this shortage there was withdrawn from cold storage 83,574 pounds, leaving the cold storage holdings now only 277,741 pounds.

We quote:

California extra creamery	60c
do, prime first	58c
do, first	57c

Daily quotations—

1918—	Tu.	Wed.	Thu.	Fri.	Sat.	Mon.
Extra	60	60	60	60	60	60
1917—						
Extra	47	47	47	47	47	47

EGGS.

Receipts of the past week were the lightest of the year. Of fresh ranch by rail only 380 cases, against 566 cases the same week last year. The receipts for the week were 1900 cases, against 2830 cases the same week last year. In the absence of fresh stock, cold storage eggs were drawn on more freely to make up the shortage. What few fresh ranch offered on 'change were snapped up at higher prices. Fresh were advanced during the week 6c all 'round and closed Monday firm at this advance.

Daily quotations:

1918—	Tu.	Wed.	Thu.	Fri.	Sat.	Mon.
Extra	60	61	63	65	63	66
Case count	54	54	54	54	54	60
Pullets	49	50	53	53	53	55
1917—						
Extra	52	52	52	54	55	56
Case count	49	49	51	53	54	54
Pullets	42	42	42	43	43	43

POULTRY.

A fair but unsettled market was had the past week. Broilers and fryers were in light supply and higher and sold very well. Hens moving less freely and 1c lower. Roasters were slow sale and lower. Turkeys were down 2@3c. Too many coming in for so early in the season. Ducks slow sale and geese not wanted.

The following prices were agreed upon last Friday, October 11, and hold good until the coming Friday:

Broilers, 1@1¼ lbs	39c
Broilers, 1½@1¾ lbs	39c
Fryers, 2@3 lbs	32c
Roasters (soft bone), 3 lbs. and up	30c
Stags and old roosters, per lb	20c
Hens	26@30c
Tom turkeys	30@32c
Ducks	22@28c
Geese	15c

VEGETABLES.

Offerings pretty good and sales slow. Potatoes came in with a rush and market prices were forced down 25c a cwt. But at this decline there was a very good movement, the lower prices causing many to anticipate their future wants.

Bell peppers, per lb	2½@3c
Chile peppers, per lb	2½@3c
String beans, per lb	4@4½c
Lima beans	3½@4c
Potatoes, local, per lug	75c@$1.00
do, do, per cwt	$1.75@2.00
do, northern, per cwt	2.00@2.30
Sweet potatoes, per lb	2½@3c
Garlic, per lb	8@9c
Onions—Stockton Yellow Danvers, cwt	$1.40@1.50
Onions, White Globe, per cwt	1.75@2.00
Cabbage, per 100 lbs	1.25
Celery, crate	3.00@3.25
Tomatoes, No. 1 lug	50@60c
do, No. 2 lug	25@35c

FRUITS.

Apples are coming in more freely and showed more life. Peaches and pears are still coming in in fair quantities, the best bringing good prices. Grapes continue to hold steady and sell well. Quinces slow sale and weak. Japanese persimmons coming in more freely and selling fairly well.

Figs, Black Spanish, 7-lb. box	30@40c
do, White, 7-lb. box	30@40c
Peaches, freestone, per lug	$1.00@1.25
do, clings, per lug	1.25@1.50
Pears, local, per lb	2@3c
Pears, Mountain	3½@5c
Grapes—	
Malagas, per lb	2½@3c
do, Muscat, per lb	2@2½c
do, Liberty, per lb	2½@3c
do, Rose Peru, per lb	2½@3c
do, Tokay, per lb	4@5c
do, Cornichon	4@4½c
do, Black Morocco, lb	4@4½c
Apples—	
King Davids, 4-tier	$2.75
Black Twigs, 4-tier	2.75
Baldwins, 4-tier	2.00
Red Pearmains, 4-tier	1.75
White Pearmains, 4-tier	1.75
Rhode Island Greenings, 4-tier	1.50
Yellow Newtown Pippins, 4-tier	1.75
Apples, Bellefleur, 4-tier	$1.65@1.75
do, 3½-tier	1.70@1.80
do, Gravenstein, 4-tier	2.25
do, do, 4½-tier	2.00
do, Bellefleurs, local, per lb	2½@3c

WALNUTS.

The California Walnut Association is now delivering about 25 cars of walnuts a day and have sold out. Manager C. Thorp says the association has not a pound for sale. There are some walnuts held by independent growers and they have been advanced another cent the past week. The market now is:

	1918	1917
Fancy budded	34½c	24c
Standard budded	32c	21c
No. 1 soft shell	31c	20c
No. 2 soft shell	28c	18½c

BERRIES.

Receipts were not heavy, but at the high prices asked sales were slow. Too much other and cheaper fruit on the market.

Strawberries—	
Fancy, per 30-basket crate	$3.50@3.75
Poor to choice, 30-basket crate	1.50@1.65
Blackberries, 30-basket crate	2.50@3.00
Raspberries, 30-basket crate	3.50@4.00

MELONS.

Watermelons and casabas were in fair supply the past week, but quality falling off and sales slow. Some few Honeydew melons continue to come in, but they are selling slowly at old prices.

We quote from growers:

Casabas, per lb	1@1½
Watermelons, per 100 lbs	75c@$1.00
Honeydew melons, 16-inch crate	75c@$1.00
do, jumbo crate	$2.75@3.00

BEANS.

Buyers continue to hold back. There were more offerings the past week and limas, large whites and teparies are all lower. There was a fair movement in limas and small whites.

We quote from growers:

Limas, per cwt	$11.00
Large white, per cwt	9.00
Small white, per cwt	10.00
Pink, per cwt	7.50
Blackeye, per cwt	6.25
Tepary, per cwt	6.25

HAY.

Receipts somewhat better, but the market was dull. Some little alfalfa is being taken by the dairy people, but there is no demand for horse hay. Dealers find it impossible to make clearances, the close of each day finding more or less hay on track unsold.

We quote f. o. b. Los Angeles:

Barley hay, per ton	$23.00@24.00
Oat hay, per ton	25.00@27.00
Alfalfa, northern, per ton	20.00@21.00
Alfalfa, local, per ton	21.00@23.00
Straw, per ton	9.00@10.00

COTTON.

An irregular and weak market was had the past week. Liverpool was a steady seller most of the week and the South also sold more freely upon peace prospects. Monday opened the current week a little firmer, with fair buying under less favorable peace prospects, and some of the weakness of the early part of the week was regained. October closed in New York at 30.00c and December 29.68c. No New Orleans market reported.

What for Next Issue?

There are about 90,000 regular readers of the Pacific Rural Press, and probably each one has his own pet ideas as to what an ideal farm paper should contain. Of course, we can't incorporate all of these ideas, but the more we know about them the nearer we can come to pleasing everybody.

Recently we sent out several thousand renewal coupons and asked subscribers to use the backs in making suggestions for improvement. A large number stated that the paper could hardly be improved upon, but several very kindly mentioned subjects that they wanted treated, and we certainly shall comply with their requests as soon as possible.

How about you? Are we covering the problems that are giving you the most concern? Have you been able to profit by the strong, helpful articles we have been publishing lately? One subscriber who had derived a great deal of benefit from them wrote us: "You have put the Rural Press so far ahead of all other farm papers that I should think you would be lonesome."

Yes, we do feel a little lonesome at times, but this will not cause us to rest on our laurels. We shall continue in our endeavor to make each issue better than the last. In this issue, for instance, Mr. Hodges gives a forecast of the 1919 wheat situation and makes some valuable suggestions for seeding; Mr. Fox comes up with two splendid articles, one on tree planting and the care of nursery stock, and the other on pruning to rejuvenate the almond; Mr. Whitten gives some sound advice about putting in milking machines. Be sure to read all of these articles.

Next week we shall get out a special issue for the International Livestock Show at San Francisco, but besides telling you all about the plans for this great show we shall make an exclusive announcement which will mean millions of dollars to the stockmen of this State. You can't afford to miss this issue; it will be a corker.

You will always find our paper in the front line trenches fighting the farmers' battles for them, and whenever any big "capture" is made you will see the first account of it in the Rural Press—the paper that goes "over the top."

Special Livestock Market Report

San Francisco, October 16, 1918.

CATTLE—The cattle market is steady. Shipments from Oregon still continue, though the end of these shipments is now in sight. Heavyweight are scarcer and in good demand. The market is over-supplied with cow stuff.

Grass steers—	
No. 1, weighing 1000 to 1200 lbs.	11½@12c
No. 1, weighing 1200 to 1400 lbs.	11½@11¾c
Second quality	10@10½c
Thin	8@9c
Cows and heifers—	
No. 1	7½@8c
Second quality	6½@7c
Common to thin	4@5c
Bulls and stags—	
Good	6@7c
Fair	5@6c
Thin	4@5c
Calves—	
Lightweight	11c
Heavy	8½c
Medium	10c

SHEEP—Mutton sheep are somewhat scarce, but lambs are being shipped in in sufficient numbers to take care of the trade.

Lambs—	
Yearlings	12@12½c
Milk	14@14½c
Sheep—	
Wethers	11½@12c
Ewes	9@9½c

HOGS—Hogs are coming in faster than packers can take care of them. They are badly handicapped in their operations by difficulty in getting an adequate supply of labor to replace a number of employees laid up with the influenza.

Hogs—	
Hard, grain fed, 100@140	17½c
do, do, 140@300	18c
do, do, 300@400	17½c

Los Angeles, October 15, 1918.

CATTLE—There continues a scarcity of choice fed cattle and they are in very good demand and the market for them firm. Choice cows and heifers are higher. Low and medium grades dull at unchanged prices.

Per cwt. f. o. b. Los Angeles—

Beef steers, 1000 to 1100 lbs.	$9.00@12.00
Prime cows and heifers	8.00@9.00
Good cows and heifers	7.00@ 7.50
Canners, per cwt	5.50
Calves, per cwt	8.50@ 9.50

HOGS—With cooler weather the market has brightened up a little. Offerings not heavy and the best are still bringing old prices, notwithstanding the declining markets East.

Per cwt. f. o. b. Los Angeles:

Heavy, averaging 275@300 lbs.	$15.50@16.50
Mixed, 225x275 lbs	16.00@17.00
Light, 175@220 lbs	16.50@18.00

Rough docked 20 lbs., piggy sows 40 lbs. and stags 40 per cent.

SHEEP—Not many coming in and under scarcity prices remain unchanged and demand fair for all fleshy lots, both sheep and lambs. Thin and medium, however, are dull and weak.

Per cwt. f. o. b. Los Angeles—

Prime wethers	$9.00@10.00
Prime ewes	8.50@ 9.50
Yearlings	9.50@10.50
Lambs	15.00@16.00

Portland, Ore., October 15, 1918.

CATTLE—Receipts, 249; market strong. Prime steers, $12@13; good to choice, $11@$12; medium to good, $9.75@11.00; fair to medium, $8.25@9.25; common to fair, $5.75@8.25; choice cows and heifers, $8@9; medium to good, $5.75@7.25; fair to medium, $4.75@5.75; canners, $3@4; bulls, $5@7; calves, $9@12; stockers and feeders, $6@8.

HOGS—Receipts, 732; lower. Prime mixed, $17.75@17.85; medium, $17.35@17.60; rough heavies, $15.75@15.85; pigs, $14.50@15.50; bulk of sales, $17.65@17.75.

SHEEP—Receipts, 310; steady. Prime lambs, $12@13.50; fair to medium, $9@11; yearlings, $10@11; wethers, $9@10; ewes, $6.50@9.

MISCELLANEOUS.

FOR SALE—Number 11 Acme De Laval feed cutter, mounted on truck, and silo chute and hopper, almost new; 6-h. p. Alpha De Laval gas engine, equipped with 20-inch friction clutch pulley, mounted on truck; used very little; P & O power lift tractor plow, three 12-inch bottoms; Kentucky grain drill, shoe type. J. H. M., 440 Montgomery street, San Francisco.

CROLEY'S BALANCED DAIRY FEED—The cheap milk producer; and Croley's Calf Meal the best California calf raiser. Geo. H. Croley Co., Inc., Eighth and Townsend streets San Francisco, Cal.

FOR SALE—8-h. p. engine, 4-inch centrifugal pump, 160 feet 6-inch, 550 feet 7-inch surface pipe. Plant can be seen in operation any time. G. W. Heer, Santa Ynez, Santa Barbara, Cal.

REMANUFACTURED PIPE.

All sizes standard pipe and wrought iron screw casing. All kinds of fittings. Guaranteed good as new. Write for prices. **Weissbaum Pipe Works,** 160 Eleventh street, San Francisco.

APPLES FROM GROWER, bulk pack, Newtowns and Bellflowers; first grade, $1.25; second, $1 per box. Edward A. Hall, R. F. D. 1, Box 39, Watsonville, Cal.

CO-OPERATION (not operated for profit) reduces living expenses. Particulars and catalogue from Co-operative League, Commercial street, San Francisco.

TO REDUCE THE HIGH COST OF LIVING, send for our Wholesaler to Consumer Catalog. Smiths Cash Store, 106 Clay street, San Francisco.

PATENTS THAT PROTECT are procured through Pacific Coast Patent Agency. Savings and Loan Building, Stockton, California. Established fifty years.

ALL SIZES OF PIPE and screw casing, both new and second-hand, dipped and undipped. Guaranteed. Prices right. Shecter Pipe Works, 304 Howard St., San Francisco.

COUNTRY LANDS.

FOR LEASE—SUMMER SHEEP RANGE—Solid tract of approximately 50,000 acres logged-off lands, Butte and Tehama counties, California, for term of years beginning with season of 1919. Accessible and well watered. Estimated capacity based on previous use, 14,000 head. For particulars apply to the Diamond Match Company, Grazing Dep't., Chico, California.

WANTED—To hear from owner of good farm for sale; state cash price, full description. D. F. Bush, Minneapolis, Minn.

WANTED.

FARM SUPERINTENDENT WANTED—Experienced in cereal, bean, beet, alfalfa culture, to advise and supervise tenant farmers; also familiar with and to have charge over pumps, motors and irrigation. Must be industrious, affable and good mixer. House and auto furnished. State experience, references and salary. Address E. M. G., 414 Clay St., Monterey, Cal.

POSITION WANTED to take charge of a hog ranch by a single man, experienced in handling registered stock. Hans Duveneck, Ukiah, Cal.

WANTED—Single man to take charge of and break horses on large ranch; good wages to competent man. Address Box 1039, Chico, Cal.

WANTED—Foreman for large ranch; must understand farming and be able to advise tenants; must have good references as to reliability, honesty, experience, etc.; state salary, experience. Address Box 1260, Pacific Rural Press.

REPUBLIC

Internal Gear Drive MOTOR TRUCKS

Save Time and Labor on the Farm

Farmers who own Republic Trucks don't have to depend on extra teams to help them out when the rush of getting fall crops to market is on.

Republic Trucks are a profitable investment on any farm. They are built with the extra strength and durability that insure their working for you day in and day out in any kind of weather.

The Internal Gear Drive has nothing to do but to drive the truck. It applies the power near the rim of the wheel and gets a big increase in pulling ability. The load is carried on a separate I-beam axle of solid forged steel, much lighter than any other form of construction and at the same time stronger.

This saving in unsprung weight means longer life to tires and important savings in gasoline and all other upkeep expense. 45% greater road clearance make these trucks travel any country road easily without fear of stalling even in mud and snow.

Republic trucks have been proved efficient in every kind of hauling. Last year Republic produced and sold more than twice as many motor trucks as any other maker.

The Internal Gear Drive delivers 92% of the motor power to the wheels. We know of no other drive that delivers as much.

More than 1300 Republic Service Stations distributed all over the United States, back up Republic quality.

Seven Models—¾ ton to 5 ton.

See the nearest Republic dealer and write us for late booklet.

K-W High Tension Magnetos are Protected Against Powder Fine Dust-Oil and Water

IN many localities tractor manufacturers find it necessary to equip their tractors with "periscope" air intakes which reach up above the cloud of fine dust. But the Magneto must be mounted on the engine and give satisfactory service under these same conditions. This is one feature that has made the K-W Magnetos the standard on tractor work.

These tractor manufacturers don't worry about dust getting into a K-W Magneto. They know its working parts are protected against even the finest Alkaline dust, and oil and water can't reach its internal parts and give trouble.

The protection of all working parts is only *one* feature of K-W Magnetos. K-W users get quick and easy starting without troublesome batteries or coils; more power out of the same fuel, and continuous, reliable, no-trouble ignition.

If you are not using K-W Ignition now, write us and let us show you how a K-W Magneto will cut your fuel bills and free you from ignition troubles, regardless of the weather or working conditions.

Insist that your new tractor be K-W equipped. Forty tractor manufacturers pay more for K-W Magnetos because of K-W superiority. Write for list of K-W equipped tractors,

Will This Grass Restore California's Pristine Pasturage?

Written for Pacific Rural Press by Professor P. B. Kennedy, University of California

A PIONEER'S PLAINT AND PROPHECY ABOUT GRASS

California's indigenous grasses, once so abundant as to pasture thousands of animals where only hundreds are able to subsist now, are fast disappearing. Whether any forage plant can be found that will grow upon our hills and plains and become a profitable substitute for the original grasses, remains for the future to bring forth. There must be a remedy in nature, but who will discover it? He who succeeds in making the discovery will be a benefactor of his race and deserve the lasting gratitude of his country. Till this can be accomplished it becomes us to be careful of the grazing capacity of our land; otherwise we destroy what cannot be replaced.—Gen. John Bidwell in his address at the State Fair of 1864.

Will Phalaris stenoptera answer this demand?

SELDOM does it come to the lot of California to find a forage that will maintain itself year after year and produce abundant and palatable pasturage or hay without irrigation. A perennial grass that will withstand the winter temperatures as well as the long dry season in the great central valleys will be of particular value to the livestock industry of the State. Recent investigations have now progressed far enough for us to announce that we have found such a grass and are willing to recommend it. It is known as "Harding grass"—Phalaris stenoptera.

The origin of the grass is obscure, and, strange to say, it has not been found wild in any country. The first record concerning it comes from R. R. Harding, Curator of the Botanic Gardens at Toowamba, Queensland. He received a small packet of the seed from Italy, and on growing it soon recognized its value and distributed it in small amounts to different countries, including South Africa.

It stools out rapidly and profusely.

Four years ago an illustration of a grass in a trial plot, in a seedman's catalogue from South Africa, attracted my attention. The report of its behavior under conditions of heavy frosts and long droughts made it appear that it might prove valuable under California conditions. Sufficient seed was purchased to sow only one-twentieth of an acre, as it was too costly to be considered in larger quantities. We have found it under the conditions which exist at the University Farm at Davis to be extremely drought- and frost-resistant during a period of at least two dry years. The grass has had no irrigation whatever and has made good with the rainfall at Davis, which normally averages 16.54 inches, and for the last two years practically only half this amount.

How Phalaris Grows.

The grass grows rapidly, stooling profusely, and produces large clumps the first season. During the first period of its existence it devotes all its energies to the production of numerous leafy shoots from the base, with a comparatively small number of flower-bearing stems which grow only to a height of about two feet. If the rainfall has been normal, it remains green throughout the hot summer, but makes little growth. If, however, the rainfall is short, as has been the case at Davis during the last two seasons, it turns brown, but the roots remain alive. With the advent of rain, as has recently occurred, we find the entire brown area a mass of luscious green leaves. The rapid growth of this grass during the last three weeks is truly marvelous.

During the second winter the plants spread out so as to occupy every available space and produce by spring a dense leafy mass three feet high. This leafage is devoid of hairy coverings of any kind, thus tending towards a clean hay and palatable pasturage. So far we have not found it to be attacked by insect pests or fungous disease.

During the month of April or later, according to the season, the strong, vigorous flowering stems shoot up from below, reaching a height of 5 feet and terminating in heads somewhat resembling those of timothy. By the middle of May it is in full flower and ready to cut for hay. We estimate the yield to be about 20 tons of green stuff or three tons of cured hay per acre.

In addition there remains below the cut surface a dense mass of leaves, which would furnish excellent pasturage. If left to be harvested for seed, we would expect about 200 pounds of seed per acre the second year. As previously intimated, the crop of seed the first year of the plant's growth from seed is very light. Unlike most cultivated grasses, the stems or straw is still quite palatable after a crop of seed has been obtained.

Its root system is similar to that of Indian corn or sorghum and not like Johnson or Bermuda grass, and therefore it is not likely to become a pest.

(Continued on page 453.)

A growth like this will arrest the attention of all stockmen on both range and farm. It looks well worth a trial.

MORE BUNK FROM BERLIN.

AS WE write on Tuesday there comes from Berlin another installment of Germany's effort to get a peace without confessing her crimes and paying for them and without giving the world guarantees that she will not run amuck again as soon as our soldiers are recalled to engage in nobler business than hunting Huns. In her last peace note Germany tries to make the world believe that her atrocities on land and sea were committed by wicked soldiers and sailors in spite of orders to be humane; that her cruelty and exactions in the countries she has desolated were only such as authorized by the laws in such cases made and provided: that she now wants peace and has a government by the people which ought to suit "his lordship Mr. Wilson" because it has just been handed down by the me-und-gott combination which in Germany is the place whence all blessings flow. Of course President Wilson is in no danger of being fooled by such bunk and will probably tell them that Marshal Foch has the key to their padlock—but still we rather like a proposition made in Congress yesterday in the form of a joint resolution proposing that Congress forbid further negotiations by the United States with Germany looking to the granting of an armistice or peace until the German military forces have surrendered unconditionally. It is possible that if the Congress of the United States should pass such a resolution the German people might realize just where they are at: make their overlords stop writing fairy tales and really do something for themselves which might give them a chance to square themselves with the world!

UNCLE SAM'S RUMMAGE SALE.

WE HAVE previously manifested much interest in Secretary Lane's undertaking to have the country searched through from end to end to discover what forsaken parts of Uncle Sam's geography can be reclaimed for farm homes to be properly fitted up and sold to returning soldiers and sailors who may wish them, on such long terms and small payments that their surplus earnings will pay for them. As we understand it, it is not a plan to give returning soldiers and sailors land whether they desire it or not: it is to help them to get land for their own and to live the land-life—not to endow them with claims or script which can be sold to land sharks for their speculative purposes. We have had enough of that. We have had more than enough of floating titles which have been gathered in booms and anchored down finally on dukedoms of land—thus closing many excellent regions to actual settlement and development for half a century already and the Lord knows for how much longer. This is a plan to sell land by the Government in small parcels to those who have served their country—land already fitted to grow crops—and to accompany such a sale with an obligation on the part of the Government to guide and advise the settler how to grow crops and to dispose of them to such advantage that he can live comfortably and ultimately pay for the land entrusted to him. As he has served his country well, so his country proposes to serve him to the end of his life. It is a patriotic policy worthy of a country which loves worthy sons. And this is true not only because of love-requital for past services but because such a country can only live in the return-love and service of its citizenship.

There is also another feature of the enterprise initiated by Secretary Lane which commends it to us. It is not a plan to handle only land in the arid region, where public lands now lie under a blanket of problems of reclamation utilization and social development. Such lands will, no doubt, be a part of the resources to be employed, but they are not all and perhaps not even a large part of it. The plan proposes to hunt up unused lands in all States and to dispose of and populate them to the extent of their producing capacity and to undertake such reasonable improvement of their natural conditions that such producing capacity shall become available. It is, therefore, a plan to take up lands which are too wet as well as too dry, lands which have been cut over for their commercial lumber product and abandoned, and lands which need some form of general improvement to make them arable and productive of crops. Probably all States have such lands. The first movement is to find them, map them and determine what it is necessary to do to make farms of them. This is the rummage which the plan proposes to set forth in shape to be useful to somebody and to add its aggregate worth to the national resources.

WHY TRENCHES LEAD TO FURROWS.

ALL WHO have written or spoken from the fronts agree that the boys we sent abroad to rescue the world from the Huns will not return to us as we sent them forth. They will not only return as men but men with loftier and more serious purposes than they had in their kitbags when embarking. This fact not only indicates that they will have new ideas of human life as a God-given opportunity but they will have new demands for ways of living. We approve Secretary Lane's plan because we believe that it will, if properly administered, meet the needs and desires of many thousands who, having lived for months or years under the sky in the strenuous open-air activities on the fronts, will never be content again to grovel in the shadows of the skyscrapers or tenements of our great cities.

Our boys, having fought the Huns under conditions which have developed their utmost in dash and endurance, will never be content to creep again from windowless boudoirs to dug-out lunch counters and to spend their lives in city occupations which afford only such environment. To move people from such activities and environments directly to star-lit vacancy and batrachian orchestration produces homesickness and desperate longing for return to the clang of the street-car gong and the glare of the picture-palace foyers, and therefore direct back-to-the-land movements from city turmoil to country solitudes have usually disgusted all who have participated in them, both as promoters and promoted. But the movement of men from the trenches and from ship-decks to rural life which will answer their longing for free action and open-air adventure is a very different thing, for it is full of opportunities for initiative and for struggle with difficulties, for which war experience has developed not only force to win but joy in the effort to win. It is just those qualities which the progress and improvement of our rural life demands. They are the same qualities which sent the soldiers of both northern and southern armies at the close of the Civil War half a century ago into the then newly opened lands of the farther west. They, too, had seen visions of great undertakings while they struggled toward the great merging of visions at Gettysburg and the development of the farther west was largely their achievement. Now we are in sight of another great onward push in this country and every State may share in it—the shoulder to shoulder push of a generation of Americans who are not merely squeezed out from cities but who will choose the country because it will better answer their burning aspiration to be men of freedom and action and not merely convict-numbers on urban pay rolls.

CONGRESS FAVORS THE PLAN.

AS THE idea of ruralizing returning soldiers and sailors is a great one and the nature of it such that its benefits will be distributed to all States, it is natural that it should receive wide public support. We have just seen a dispatch from Secretary Lane which speaks of the progress of the plan in these words:

"The committee on public lands of the Senate has unanimously reported in favor of a bill appropriating a million dollars to make surveys of farms for returning soldiers. In this report the committee says the proposed legislation is for the purpose of providing an opportunity to procure homes for those of our returning soldiers and sailors who may wish them as well as giving opportunity to thousands of workers in munition factories and other war industries, who at the conclusion of the war will be out of employment, to promote a 'back-to-the-land' movement.

"It is recognized that one of the great evils of the times in our country is the overcrowding and congestion of people in the cities, many of whom are utterly unfitted for city life and not adapted to the application thereof, and after the war this undesirable condition will be greatly intensified. It is the object of this proposed legislation to provide them with a chance to get on the land."

The preliminary work which is now in good prospect of being provided for by Congress is already in progress and Californians are rendering important service in connection with it. Dr. Elwood Meade is assisting Secretary Lane in the development of the general plan and H. T. Cory is one of those who are looking over the States for unused lands which may be subsequently more carefully considered—as we roughly intimated in our issue of August 17 and September 14 last.

THE COUNTRY NEEDS SUCH MEN.

TO SECURE the progress of this country and to insure the prosperity and comfort of our multiplying millions, the return of our soldiers to the arts and industries of peace as soon as their foreign work is complete is essential. We blamed the labor unions last week for tolerating the claim that they should be kept abroad to prevent crowding in American labor procession toward higher wages and shorter hours. Beyond the reasons urged against such an ill-begotten scheme last week there are considerations which remove all reasonableness from it, and they are involved in the plan to ruralize all the returning soldiers and sailors who have any desire for such life—and because of the facts of their changed ideals and temperaments already cited we believe there will be very many such. To colonize such men on unused lands well prepared for them will add to the available rural labor in all States. As their enterprises will not be large they will have day's work to exchange among themselves and they will have also a large aggregate force to turn into ready cash while the peak-loads are on the labor power-wires in their districts. It would be vastly more humane, patriotic and reasonable for the labor unions to utterly reject the wild idea of keeping the boys marking time in the ranks abroad and take up enthusiastically the present plan of returning them as soon as their work is done to rural activities in this country. Of course unemployment in the cities is deplorable—cruelty to the idle men and a curse to the urban communities. There is no menace of unemployment in the country for men who have the quality of coming through and sticking to their jobs which the service has developed in the young Americans who are now on the various fronts on land and sea and in the air. Therefore, let them return as soon as possible. Interest every possible one of them in making rural homes of their own. See that they get no land which is not ready for production. Provide them with instruction and advice as to how their jobs should be done to be safe and profitable. Do this in every State where suitable idle land can be made ready and we shall have an uplift of rural industry in this country which will be commensurate and correlated with the unprecedented development of manufacture, trade and commerce which the return of world peace will bring. It is surely a statesmanlike plan.

FARMING NEEDS MORE STEEL.

IN A VERY vexatious way it is baffling to write of what should be done for the boys and what they should do for the country in farming while one knows of the limitations which are

being put on the 1919 supply of steel for agricultural implements and farm tractors. You can no more do modern farming without plenty of steel than you can make modern warfare without it. And as successful warfare is absolutely dependent upon plenty of food and plenty of food is only attainable by the service of plenty of steel, it looks to us as though steel for farming should be considered as a first and fundamental war need and treated as such. Instead of that the action of the War Industries Board, as of October first last, seems to indicate that that body looks upon farm tools and tractors as in the same category with bicycles, metal beds, baby buggies, burial caskets, passenger automobiles, etc., and therefore subject to a flat cut in allowance of iron and steel for the year ending September 30, 1919. It is fortunately true that the board does discriminate somewhat because farm tools and tractors are only cut off with 25 per cent less metal than they required during the year ending September 30 last, while some of the indispensable things in the category above are cut 50 per cent, and yet it is also true that one had better sleep on the floor than not have any food to hold up his ribs on a metal bed: that the baby might ride pick-a-back like a papoose than go hungry and that when a man gets over being hungry he might better be cremated in a wooden box than shut up under ground in a steel overcoat. From all that is probably truly said about the need of food for our troops and our allies, it would surely seem that farm tools and farm tractors should have all the metal they can use, even if the board should be compelled to absolutely prohibit the production of brass monkeys to give it to them. It is difficult, of course, to determine what are really essential things and to discriminate against all others, and in this country we have suffered mighty little in that direction, but if the production of steel is so limited by labor troubles and coal troubles, which are another form of labor trouble, that 25 per cent has to be cut from the current requirements of crop production, there surely should be an effort made to determine exactly what other uses of metals are essential and whether the labor troubles which limit production are themselves essential or otherwise. If labor will not dig coal or burn coke so that steel mills can roll or cast steel, so that farmers can get tools to grow crops, so that the war can be won and labor need not go hungry, there is surely something unnecessary in the endless chain and it is not in the farmer's link of it. It is our judgment that the War Industries Board should review their schedule of reduced metal allowances and think more of tools for food production as a war need, which should not be balanced against jack-knives and clothes-wringers in their essential reduction categories.

QUERIES AND REPLIES

By the Editor.

Inquirer Must Give Full Name and Address.

Fruit Planting on Oak Lands.

To the Editor: I have 25 acres of red upland cleared on my ranch in Tehama county, on which I intended to plant French prunes, but have been advised not to do so by a Santa Clara Valley prune man, owing to the fact that the land was originally covered with live oaks. My friend advises me that considerable trouble is caused by what he calls "oak fungus," and which he claims is present in all land in which live oaks have grown. Can you give me any information regarding this "oak fungus," and do you consider I would be taking any great risk in planting such land to prunes? Of course, the land is under irrigation.—L. C., San Francisco.

The danger to fruit trees in oak-cleared land does not lie in the land as a whole but in the chance of contact between the roots of the trees with decaying oak roots remaining in the land. The chance of this is present for many years, but it is not great enough to prevent planting of such land to fruit. If California planters had forsaken fruit planting because the land had oak trees cleared from it, we would not now be growing the amounts of fruit which are being produced. It is not wise now to refrain from planting for that reason, if other conditions are favorable. In breaking up the land deeply keep one or more men busy pulling out and picking off all root pieces disclosed by the plow. In digging holes for the trees get out all possible of all oak roots encountered. For some years trees will encounter root pieces and fail here and there and need to be replaced with new trees, but there is nothing in the outlook to warrant you in changing your plans.

Crops to Follow Sudan.

To the Editor: What grains can successfully follow Sudan grass for winter planting? I understand that barley cannot. Can wheat, and, if so, what variety is best? When should it be planted? How should the soil be treated to get rid of the Sudan stubble and make ready for the wheat planting? How much wheat should be sown to the acre?—E. W. L., Maxwell.

We are not aware of experimental data enough to answer your main question very confidently and would be glad of reports from those who have settled it to their own satisfaction. Wheat and oats are said to be less sensitive about following a sorghum than barley, and a crop with a longer season is said to be less affected than one which tries to come through more quickly. If you choose wheat, we would rake off all the coarse stuff you can and burn it or pile it for rotting. Then disk up the stubble and roots as fine as possible and leave it on the surface rather than plow it under—unless you have a heavy soil and expect plenty of water to settle the land and rot the rubbish. Sow the wheat and harrow it in as soon as the soil is wet deeply enough to carry the growth. It will do better on a firm subsoil than on a loose seed bed, full of trash. Sow the wheat which is chiefly grown in your region, probably White Australian, about 75 pounds to the acre.

Splitting of Peaches.

To the Editor: A great many of my peaches split open on one side clear to the pit: the pit not being split, just the peach. Can you tell me the cause of their splitting, also if there is any remedy for it?—M. R. M., Willits.

This is apparently a very different trouble from split-pit, though we have not demonstrated the cause in either case. It is probable that the splitting of all fruits is due to the same or similar cause, though we do not surely know what it is. There seems to be reason to believe that it has relation to inequality or uneven moisture and quick changes from one condition to another and this may be in the soil or in the air. Some varieties are more subject to it than others and where the trouble frequently occurs all bad-splitting varieties should be rejected in planting or grafted out in older trees. Liability to splitting is particularly variable in the case of plums: some are almost sure to split every year in some localities and others never split. No remedy for such behavior has been demonstrated.

Highway Robbery.

To the Editor: A friend of mine just informed me he knows of a case where a man was fined $25 for picking up two walnuts which had fallen on the county road from a tree which overhung the county road running past a grove near Walnut Creek. In Europe, I believe, the law is that anything overhanging the county road belongs to the community. Will you kindly inform me what the law is in this country?—M. W. F., San Francisco.

We doubt if there is any one law prevailing in European countries. In this country, so far as we know it, the abutting owner owns to the middle of the road—except in towns where charters or ordinances provide for public ownership and control of the roadways. In the case you mention the trespasser was over-punished, if the facts are as stated, but it must be remembered that orchard property is constantly and systematically looted by people who use the highways and exemplary punishment is justified, though we must wish that it had been for a more flagrant transgression—of which there are altogether too many.

Growing Peach Trees.

To the Editor: What is the proper time of year to plant peach pits for nursery stock, also how deep and how far apart in the row? They will be in the same place for two years.—H. G., Santa Margarita.

It is usual to put the pits about this time of the year in a bed where water will not stand,

Field Men Wanted

Are you draft exempt? Have you an automobile? Are you free to travel? Are you convinced that the Rural Press is the best paper of its kind on the Coast and that it should be in every farm home? If so, we need you to take the place of field men who have been drafted. Pleasant work, attending to our renewals and presenting the paper to those not already subscribers.

Straight salary; permanent work, with advancement. Lack of experience no barrier. If you are a live wire, are willing to learn and want to make more money, let us tell you how to do it. Our offer is a liberal one

putting in about three inches of sand, a layer of pits, then a layer of sand, a layer of pits, etc.—making a sandwich of sand and pits a foot or more thick. The pits are left in the sand during the cold weather and when they begin to sprout and the nursery ground gets warm (say in February or March), the pits which show sprouts are planted about two inches deep and ten inches apart in rows four feet apart. In this way you can get a full stand because you plant only pits which have started to grow. It is not a good plan to leave peach trees in place two years. Seedlings are budded the first summer and allowed one summer's growth on the bud and then planted in orchard.

Budding or Grafting Figs.

To the Editor: How shall I proceed to bud or graft figs?—J. L. S., Ramona.
